Special glass. Stained or art glass is carefully treated with chemicals, such as oxides of iron, making the greens and browns; copper, making reds; cobalt oxides, blues; tin and zirconium, the milky or opaque varieties. Optical glass requires the purest materials and the most clever manipulations, of which only a few firms are capable. One telescope disk, 70 inches in diameter and 12 thick, took ten months to cool. Recently, attempts have been made to cast a lens as large as 200 inches across and corresponding thickness. The familiar cut glass requires great patience and experience, as it is turned under wheels of emery upon which water mixed with sand is constantly running. Glass may also be etched with acids or engraved with tools, or moulded into many beautiful forms.

Safety glasses are of two types. First, a mesh of wire can be used as in the common wire glass, but this obscures the vision, though it saves particles from flying when the glass is shattered. Second, a sandwich can be prepared. The most common form recently developed has two thin layers of glass, between which a film of cellulose product is placed. Then the three are united firmly under pressure and heat. This kind has been much used in automobile windshields, and in armored car constructions. When the glass is broken, the pieces are held by the cellulose or celluloid film between the layers, and so they do not fly. Special glasses to transmit the ultra-violet rays are now produced by the exclusion of all iron oxides and of lead composition in the glass. Corex, an American type, allows most of the rays to penetrate, a condition impossible with ordinary glass. *Pyrex* and *Oven Glass* are trade names for products which resist changes in temperature when these might cause cracking. *Quartz glass*, made of pure sand, transmits the violet rays almost perfectly, but this is expensive at present.

Glass producing centers today are western Pennsylvania, West Virginia, and Ohio, central Indiana, Oklahoma, California, and at various single points in New York, New England, and the South.

GRAPHITE. As one of the forms of carbon, graphite has been known for centuries, plumbago, black lead, and drawing lead being other names for it. In nature it occurs in crystalline rocks; in manufacture it results from making pig iron, being known as *kish;* in artificial form it is allied to carborundum, both products being patented by E. G. Acheson of Niagara Falls, N. Y., graphite in 1896. Artificial graphite is made in electric furnaces from moulded carbons, and from anthracite itself. K. W. Schell first (1779) discovered its composition chemically, and A. G. Werner, another German, invented the name (1789) from the Greek word meaning "I write." Graphitic veins in rocks seem related somehow to metal veins in crystalline material. Important supplies in nature are found in the Laurentian rocks of New York, Ontario, the famous Alibert mine at Irkutsk, Siberia, a mine in Cumberland, England, others in Sonoma, Mexico, and great deposits also occur in Bavaria, Austria, and some in Australia. Owing to the difficulty of dividing graphite from impurities in rocky material, certain sources are not used at present. Sometimes it appears in flaky form, and at other points it is amorphous, or formless.

Uses of graphite. Since 1425 graphite has been used for pencils for drawing in Italy, and from 1775 or before at Nuremberg, Germany, where the celebrated Faber pencil works are now situated, for which the chief supply is the Alibert mine. Much of the material for use in the United States comes from Mexico and New York; since 1890 we have exported great quantities of finished pencils. For softer "lead" or graphite pencils, little clay is mixed with the pure form; for harder, varying degrees of clay are intermingled. Proportions vary from two of graphite, to three of clay for common rather soft leads to twenty-six of graphite, sixteen of clay, eight of antimony, and six of lampblack. Though pencils illustrate the most familiar use of graphite, more than one-third of the total world product goes into the making of crucibles, retorts, furnace linings, stirrers, and other articles which must be made to withstand very high temperatures. For crucibles in the manufacture of gold and silver and for containers of acids, graphite is highly suitable.

Mixed with clay and sand certain forms have immense hardness, toughness, and heat resistance. Crucible graphite may have quite a proportion of impurities, but pencil graphite must be very pure, flake graphite being unsuitable for the latter. Flake graphite, however, is most suitable for making lubricating substances. It will adhere to highly polished surfaces, and, mixed with oil or grease, proves highly effective in reducing friction. Ticonderoga flake from New York is adapted to these uses. High speed steel journals, engine cylinders, and sliding objects in contact with others are treated with graphite. In paint graphite forms an important component for use on rough surfaces, such as factories, ships, chimneys, steel containers like gas-holders, roofs, machinery, and the like. It is also largely used for facings to keep hot castings from adhering to the sand of these moulds; here by slow combustion it liberates a gas that protects the metal. Since 1827 graphite has been used in stove polish, and the artificial form since 1895 in making commutator brushes for dynamos. Some of the incidental uses are these: in pipe cement, in electroplating, in giving tea and coffee color and glaze, in protecting gunpowder, in preventing boiler scale.

GYROSCOPE. A comparatively heavy rotating wheel, mounted on its own axis, and also so that it can turn in two other directions. It was first made practical by Bohenberger (1810), demonstrated and named by Foucault (1852), improved by G. M. Hopkins (about 1900), and applied in numerous inventions by E. A. Sperry (q. v.). It made possible a monorail car by stabilizing the mass in rounding a curve, and in keeping the car on the track at all times. The simplest gyroscope consists of a rotating wheel, which attains great speed, and applies the principles of inertia and precession. By utilizing inertia it secures rigidity and stability; by applying precession, it secures resistance to change of position with regard to the axes. Sperry's gyrocompass was first used in the United States Navy in 1911, and now it is installed on most ocean craft. Sperry also designed gyros for directing torpedoes, for automatic control of ships, for preventing ships from "rolling," and for recording depressions either in the road-bed or in the rails of railroads. Other applications by inventors are to the "autogiro," a plane with rotating wings, perfected by Cierva in Spain; a turn and bank indicator much used in modern airplanes; and even a gyroscopic device to fly a plane automatically. Within two decades the gyro, in different forms, replaced many of the old stabilizing, steering, and direction recording devices.

HEATING AND VENTILATION. Primitive man in temperate zones either went cold or used sticks for fires for heating. Until long after the settlement of America, the *fireplace* was the main method; and this is still largely used in England. Though elaborate and ornamental fireplaces were developed, efficiency was less than 20%. Thus, even today with fireplace heat, one may roast on one side toward the flame and freeze on the other; yet for sentimental and ornamental value, many homes retain fireplaces as secondary heating devices.

Benjamin Franklin invented (1744) a *cast-iron stove* set out into the room from the fireplace and allowing heat radiation from all sides. Some form or development of this is extensively used today. The efficiency of this type, however, is 50% or less of the fuel burned. Franklin also thought of a device resembling our hot-air furnace, but it was 1835 before one was installed in New England at Worcester, Mass. Meanwhile (1830) the base burner was developed; but this, too, wastes from 20 to 30% of the calorie value of the fuel.

The *warm-air furnace* is economical, reduces the fire hazard, and, being usually in the basement or cellar, does not devitalize the air in living rooms so rapidly as either the fireplace or the common stove of all types. Pipeless furnaces, where the heat easily distributes itself to the rooms above, by rising directly from the heating drums through a large register, are economical and popular. If the circulation of cold and warm airs is properly arranged, the warm air furnace works well. Sometimes a blower in the pipes sends the air up more quickly.

Hot water heating was known to the Romans. The Marquise de Chambon developed a type in England (1816), and Canada, and the United States somewhat tardily fell into line. This is ideal for low buildings, totally unsuited to high ones because of pressure of the water in the pipes, and a lasting heat. Its disadvantages lie in mechanical defects, stoppages, delay in heating the water, but the radiators retain the heat a long time. Steam piping cools off sooner, but heats more rapidly. Some steam systems are provided with a continuous return to the boiler; in others the steam must condense into water and run back by the same pipes. Collection of water in the single unit leads to disagreeable pounding by the fresh steam behind it. Combination systems of steam and hot air have proved fairly effective. Warm air plants retain their great popularity because of low initial cost, simplicity of operation, and the fact that some heat is always available when there is any fire in the furnace itself.

Good *ventilation* is a requisite of good heating. Warm air plants draw the cold air by piping from the outside or from near the floors. Circulation of good air is thus provided. Oxygen forms about one-fifth, nitrogen about four-fifths of the air; and of this mixture each adult breathes about 2,600 gallons or 425 cubic feet in each 24 hours. Freedom from gases like carbon dioxide, found in vitiated air, is a test of purity; air should not contain much more than four parts of this gas in 10,000 of pure air. Bad air has a depressing effect on the skin as well as on the lungs, a fact demonstrated fully in 1913. Humidity, odors, dust, and other foreign substances in air render it less comfortable to man. Complete ventilating systems now imply good heating, clean air of sufficient humidity, the removal of vitiated air by a fan system. The fan may provide for both heating and ventilation; for ventilation and part of the heating; for ventilation solely.

Systems of washing and filtering the air are used in theaters, halls, and some office buildings. In modern theaters and schools the air may be completely changed in a few minutes. Filtering is accomplished by passing the air through a screen or some retainer wet with oil, which collects the dust and other foreign particles upon the screen. To save discomfort or excessive "drafts," air is introduced from above and withdrawn from vents near the floor. Each person should have about 30 cubic feet of new, fresh air each minute.

INK. Any liquid or viscous material used in writing or printing. Early peoples used various material for making ink; Pliny mentions the cuttlefish as furnishing ink basis. *China ink* and *India ink*, still much used in the arts, are of ancient origin for use with a brush. Like many modern inks they contain lampblack highly refined and mixed with glutinous substances, not given to fading, and easily transported in tubes or squares, which are melted in water.

Tannin inks contain galls from Asia in powdered form, mixed with tannin, salt of iron, chopped straw, and some glue substance, the whole being fermented and otherwise processed. Black and colors are made by mixing different pigments. Logwood is used in some copying inks. Brazil wood is used for red ink; prussian blue for blue, and both have anilin competitors. Indeed many *anilin inks* are on the market, such as nigrosin or black, which is non-corrosive, runs well, and does not readily fade. *Marking* ink is a compound of salt of silver, water, ammonia, with some thickening, and this is the familiar type for marking linen and other fabrics. *Indelible* inks have as a basis lampblack mixed with some material which sets the color. Sympathetic inks, of little use except in stories, are those made of some solution and are readable only when exposed to light, heat, or some particular chemical. Varnish, pigment, and oil, with anilin color, now make up most of the *printer's inks*. Writing fluid, or the familiar "fountain pen ink" is made of a base of pigment combined with some watery fluid made to flow easily by thinning and special treatment.

IRON AND STEEL. Though iron makes up 4% of the earth crust, it is rarely seen in pure form save in meteors. Next to aluminum, iron is the most abundant of metallic elements. Iron ore is pure iron combined with one or another substance, chiefly oxygen, carbon, silica, and sulphur. In the United States, only the oxides of iron are commercially important, save the sulphide ores in Pennsylvania. Magnetite, hematite, limonite or brown ore are the chief commercial types. Magnetite, known for its magnetic properties, is found in purest form in Sweden, containing about 72% of metallic iron and 28% of oxygen. Because they contain chromium and titanium oxides, many deposits of magnetite are unfit for working. Red hematite, öolithic hematite, and fossil ore are the main varieties of hematite, the best form of which is found in the Messaba district in Minnesota, where it varies from 39 to 67% of pure iron from the surface or strip mines. Limonite or brown ores, found in many regions, are richest in southern Virginia, and yet they seldom compete with the ores of the Lake Superior district.

Huge shovels in the Minnesota strip mines lift up the ore, load it upon cars, which are taken to Lake Superior ports, and thence to Cleveland, Chicago, Buffalo, and on to Youngstown, Pittsburgh, Wheeling, Gary, and other destinations for refining and making into pig iron. Birmingham in the South, Baltimore on the eastern seaboard, and Denver for western production of iron ore, are other chief smelting centers. States leading in casting of pig iron are, in order of rank, Pennsylvania, Ohio, Illinois, Indiana and Michigan, Alabama, Wisconsin, and Minnesota. For the crude iron ore, before it is refined and made into pigs, Minnesota leads Michigan by three to one, and then follow in order Alabama, Pennsylvania, New York, New Jersey, Wyoming, and Tennessee. The combined Lake Superior regions yield about 60 million long tons a year; Alabama next with only 6; and the rest of the land, 3 million. Leading foreign regions are the north of England; the Lorraine in France and adjacent areas like the Saar; fairly good supplies in Sweden; and huge unestimated quantities in Brazil and in China and other parts of Asia; others in and near the Ural Mountains. Newfoundland of late has built up important developments, and Cuba has shipped much iron ore for refining in Baltimore.

Early smelting of iron ore. Centuries before Christ men worked iron into various designs. Because of oxidation or rusting few of them have survived when exposed to the air. Tubal-cain, in the early dawnings of human history, was described as "an instructor of every artificer in iron and brass." Herodotus asserts that iron tools were used in making the pyramids. Iron recently found in Egyptian tombs shows a high degree of skill in fashioning implements. China, Chaldea, Assyria, Babylonia, India, even Africa knew iron making in early times.

Yet the aboriginal settlers in America seem not to have known the use of this metal. Coal first replaced wood and charcoal in the refining of iron in 1611, but became general only about 1700, and coke was used first about 1750. Iron was found in North Carolina in 1585, Virginia exported ore in 1608, and Massachusetts in 1642. By 1790 machines were introduced to make nails and tacks. Hot air was first used to hasten the smelting operation in 1828, giving rise to the blast furnace well known today. Henry Cort in England in 1784, by using a system of rollers to press the iron forms, invented the first "puddling" process. Not long afterward American furnaces were turning out 35 tons of iron a week. Today a modern large furnace makes at least 500 tons a day. Though the extension of railways after 1830 created a large demand for the native products, it was not until after the Civil War that importation of wrought iron from England wholly ceased.

Making pig iron. It requires two tons of ore, one of coke, and about one-half ton of limestone to turn out a ton of pig iron, of which thirteen different classes are recognized, according to use and type. The production of pig iron is a highly specialized affair, requiring definite apparatus, the chief elements of which are blast furnace, with stack blower, hoisting machinery, track to bring up the ores, and ingenious system of two bells inside the furnace to permit charging or filling with ore while the furnace is in operation or in blast. The little bell is above the larger, and both are like inverted funnels. The ore is dumped on the little bell, which is lowered to allow the ore to drop upon the large bell, which remains fixed in place, so that no gas can escape. Ore and limestone are alternated with loads or "skips" of coke, usually two of each in succession.

Air at from one thousand to twelve hundred F. is blown in from the bottom of the furnace and up through the mixture, and the process of refining continues until the furnace is shut down for repairs or other causes. Certain chemical combinations take place, and limestone takes up the impurities originally in the ore, and at last the molten metal filters down through the mass to the hearth of the furnace at the bottom. The impure portion called "slag," being lighter than iron itself, floats on the top, and then is skimmed off and so removed from the upper of two holes in the bottom of the furnace, while the pure molten iron is allowed to run out when the clay holding it back is removed from the hole lower down.

Two kinds of iron. Thus we see that pig iron is iron ore separated into the iron itself and the impurities, the latter of which are discarded.

Cast iron, as it is called, is simply pig iron made into serviceable sizes and shapes by placing it in molds. Though not malleable, it is of great service for foundations for machines, canal lock gates, and other heavy uses. *Wrought iron*, the second type, may be made crudely by melting the ore and forcing, hammering, or pressing it into shape while it is not fully cooled, or when it is pliable or workable into forms desired. A better way is to place pig iron in a furnace, already lined with oxide of iron, and in this manner the iron becomes a pasty mass, the impurities are removed, and it is afterwards treated or pressed to make it still more pure. Wrought iron is tough, very malleable, and soft, good for plates, sheets, bars, wire, tubes, and many other forms. The Bessemer converter process, described below, was used for many years, but more recently the Ashton process has been adopted, though even by this the cost of making wrought iron is higher than the cost of making steel.

Steel making. When man began to purify pig iron, to combine it with other metals, and to refine the manufacture of a myriad number of articles, the modern industrial world was possible. Steel is pig iron rather fully purified, unlike wrought iron that is made while the product is partly heated, but rather purified while completely molten. Steel is often named according to the ways of making it, such as Bessemer, open hearth, electric, or crucible steel. Again, steel is named according to the metal with which it is alloyed, such as vanadium, copper, molybdenum, chrome, and nickel steel. Next the four ways of making steel will be briefly described.

First, the *Bessemer process*, named for Henry Bessemer of England, who introduced it in 1855. In this process a large pear-shaped converter, while in a horizontal position, is charged with molten pig iron. Then it is moved into a vertical position, while air is blown through the iron, oxidizing the entire mass and converting it into steel. Today such a converter, with a capacity of from 5 to 25 tons at a charge, turns the iron into steel in approximately ten minutes.

Second, the *open hearth process*, of which two varieties have been developed. By one of these, all the phosphorus of the original pig iron,is still retained in the finished steel, and so only materials of rather low phosphorus content may be used. This acid open hearth method, as it is called, is gradually giving way to the basic open hearth type of refining. Since 1866 the open hearth furnace has been pushed to its present high state of development. The basic process may be compared to drawing heat from some source over a huge saucer to bring the contents of that saucer to molten state. Though this method is slower than the other, added advantage is gained in that the oxidation of the ingredients of the pig iron proceeds in a way more easily controlled by man. Thus the chemical composition of the steel is more uniform.

Third, *crucible steel*, of special hardness and strength, is made by fusing wrought iron and scrap together in graphite-lined crucibles. To this mass, alloying elements like vanadium, chrome, and others may be added. Only com-

paratively small ingots of steel may be made at a time in the crucible.

Fourth, *electric steel* furnaces now are superseding the crucibles, since they maintain higher temperatures, can use larger and cheaper quantities of material, and give a greater range of alloying with other metals. Again, the electric current is more under control of the metallurgist, higher temperatures can be attained quickly, and the various elements are more easily handled.

Some steel products. Steel pieces or ingots can be rolled or flattened into desired shapes. They first pass through a "blooming mill," which makes the basis of all steel products. The resulting "bloom" is then rolled between horizontal cylinders or rolls, decreasing the space between the rolls as the steel piece goes back and forth between them. More modern mills now have continuous rollers, each set of which reduces the thickness, or modifies the original piece in some manner, until the right size or type of steel is obtained. Some of these numerous individual products or forms are rails for railroads; I-beams and others for all sorts of building, from bridges to sky-scrapers; sheet steel, in forms varying all the way from the kitchen skillet to automobile bodies; all sorts of pipes, wires, roofing and bridge floor materials, fences, and—well, look about and your eye cannot travel long without seeing some modern steel product.

Steel sheets are made of various thickness and lengths; up to 60 inches wide. Pipe has long been made by bending sheets and welding the seam together. Now seamless tubing bids fair to replace this older method although it has not yet done so to any appreciable degree. Seamless pipe is made by passing a mandrel or piercing instrument through a hot billet. Steel rods are made by a series of rolling operations, then the rods are drawn through dies while cold to make wire. This drawing is done while the steel is cold because it greatly increases its strength. Steel is adapted to being formed while cold, consequently most of it is pressed into shape without heating. Automobile bodies, office furniture, frames for stoves, electrical fixtures, car wheels, heaters, washing machines, typewriters, and thousands of other articles are all made from this metal which is almost universal in its adaptability and usefulness.

LACE. Ornamental work of flax, linen, cotton, silk, metal, or other fibers, looped, twisted, or braided, is called lace. Though hand-made lace is still more highly prized, machine products have gained tremendously in number and practical uses. Egypt had fine laces by 100 A. D., and early forms of weaving centuries earlier; the Romans may have made lace by machines or by bobbins; Italy in the middle ages made noble specimens; but England lagged much behind the continent, though embroidery before 1300 attained an excellence never surpassed in modern ages.

Four methods of lace making are distinguished: needle, bobbin, crochet, shuttle. Needle lace is well known in drawnwork, consisting of taking out certain threads from the original pattern or cloth. If the threads are cut, the product is called cut-work. Bobbin lace is made with bobbins, pins, and a pillow or cushion. The pattern is pinned on the cushion, pins are stuck at intervals in this, and then the bobbins plait the threads around them, the result being a definite pattern. Crochet lace is made by putting one thread through a loop of another by means of a crochet hook. Shuttle lace, either made by hand or machine, is woven by passing a shuttle back and forth to make a pattern.

Venice and Genoa once led in fancy laces, the "point" of Milan also being famous from 1500 to 1700. Louis XIV of France imported skilled workmen from Italy, Belgium, and Holland who invented many fine needle work patterns, later imitated or imported by England. In time families developed special techniques, which were handed down through several generations. Certain patterns thus created now bring great sums from those who prize old laces. Irish laces also have led in linen patterns, the chief types being Carrickmacross, Limerick, and Irish point. Celebrated continental types are Flemish needlepoint, point de France, Valenciennes, point d'Angleterre, Venetian point, and Milan point.

LACQUERS. See under *Varnishes*.

LEATHER. Primitive man was well versed in methods of tanning or making leather from hides of various animals. Long ago the American Indians, for example, made leather goods which are hardly excelled in beauty and usefulness today. Chinese, Egyptians, and Romans had processes that were most effective. For centuries man clothed himself in skins and furs, long before modern tools were available for dressing them, and yet the product survived long after the original owners had passed from earth. The American colonies all had important legal and trade enactments to govern tanning. Massachusetts led in tanning, with Virginia a close second. Once laws forbade the same men from tanning, currying, and making shoes from leather, each of these processes being confined to one separate group. New England had most of the tanneries until about 1860. Of about 450 tanneries at present, Massachusetts has one-fifth, with Pennsylvania, New York, Missouri, and New Jersey next in number of plants. St. Louis, Boston, New York, Cincinnati, Rochester, and Philadelphia have had large plants. Illinois, Wisconsin, Ohio, and California tend toward a few large plants, the eastern ones being smaller, but at times more active. One-fourth of all tanneries are large enough to turn out products worth at least a million a year. The large countries of the world lead in order—India, United States, China, Germany, Argentine, Italy, France, Great Britain, and Australia.

Tanning is sometimes an elaborate process, having as its chief motives the preserving, softening, waterproofing, and beautifying of the original hides or skins. Among simpler methods are drying, with or without adding chemicals or oils or salts; dry salting or covering with salt or salted earth; and wet salting or immersing in some watery or preserving substance. Tanning usually implies a more careful process, however. Both acids and alkalis have been used in tanning. *Tawing*, an older process less used now than real tanning, consists of treating skins with oils, fats, albumens, or alum. American "morocco," once popular for shoe uppers, was a product of the tawing process; so was French chamois for gloves, and other leathers treated with egg yolks, alum, salt, flour, and other substances. *Currying* is a process to soften leather, left hard after tawing and similar methods. Oils are scraped, rolled, or beaten into the leather. Tanning proper used to be accomplished entirely by use of various barks containing tannin, hemlock being the chief kind used. The tanner submerged the skin in a series of vats, each having a stronger solution than the previous one, and the entire process often took a whole year. Now by the chrome process, by use of stronger and often different acids, the time is reduced to a few days, or hours even, in some instances. Tanning materials are of two kinds at present: crude vegetable woods or chips, like hemlock bark, oak bark, chestnut wood, myrobalans, nuts, wattle bark, valonia cups, mangrove bark, sumac leaves, quebracho wood, and a few others; vegetable extracts derived from chestnut, quebracho, oak, sulphide cellulose, hemlock, logwood, gambier, sumac, wattle, and mangrove. In each class the order is that of importance of the material. Various chemical or synthetic tannins are now made, the chief components being sulphuric acid, phenols, and formaldehyde.

Special processes vary somewhat from the general methods. Sole leather is prepared by coloring, immersing the skins in a series of strong liquors, and finally dusting them with dry tanning material and leaving them in stronger solutions for a long time. In any case the skins are first freed from hair, surplus flesh, and are treated with lime or other material. Calfskins are suspended in a liquor like those mentioned above, and later treated with a more mild solution to improve the color or reduce the shade. Sumac is usually employed for sheep skins, which are tanned in a short time, sometimes not over 12 hours. Chrome tanning is accomplished by pickling the skins in sulphuric acid and common salt, and then by forcing into them a solution of bichromate of soda and acid. Oil tannage removes the natural greases from sheep skins that have been split by machinery, after which fish oil or some other is forced into the fibers, followed by further treatments, partial drying, and heating. After the main processes of tanning, a further currying or oiling or greasing is accomplished. Finally, the dyeing by direct brushing or staining, dipping, running the skin over a drum or paddle, or spraying.

Uses of leather. Hides for making leather are chosen from the entire animal world: from animals like cattle, sheep, goats, deer, pigs, seal, antelope, whales, sharks, elephant, kangaroo, and rabbits; from reptiles like snakes, lizards, alligators; from birds like ostriches, swans, and at one time chickens. Fur-bearing animals are made into wraps and clothing, without removing the hair, and by tanning one side only. Heavy leather goes into soles, belts, and harness; calf into uppers, book bindings, and ornamental work; sheep into linings, gloves, aprons, and parchments; goat into shoes for ladies and gloves; pig into bags, saddles, and bindings; dog into gloves for rough wear; and horsehide into strongest gloves; others for special, fancy, or art uses.

Leather substitutes. Man looks for cheaper or greater supplies. Scarcity and high price of leather drove inventors to look for cheap leather substitutes, known to us since 1850. The World War stimulated ingenuity. Even before, various rubber products were used for soles, and synthetic products have had a great vogue for several years now. Basic fabrics are impregnated with imitation substances that look like leather. Coating substances are of cellulose nitrates, oily compositions, coloring material, pigments, and plastics of considerable variety. Belting is now made of fiber, cloth, rope, or wire. Three-fourths of the shoes now have rubber heels. Popularity of low shoes, use of cloth for uppers, and the use of the automobile have decreased the demand for leather. Among the varied uses for artificial leather are these: notebook covers, automobile tops and seats, luggage, water proof materials, wall coverings and other decorative articles, and various kinds of wrappings. The United States alone produces almost 100 million yards of artificial leather material a year, mostly in fabric form.

LINOLEUM. As the name implies, a combination of linen (really jute material) with oil to make a floor covering, as designated by the inventor Frederick Walton (1860).

Previously woolen cloth (1636) had been treated with oil and some other components; and with India rubber or gum lastic (1751), and with resin, pitch, beeswax, and linseed oil (1754). Galloway (1844) mixed cork dust with softened India rubber, and at last Walton solidified oxidized linseed oil, a process still largely employed.

Details of making linoleum. Items in the process include these: preparing the oil, making a cement, mixing this with ground cork, applying the component mixture to a canvas of jute, seasoning the product, and making it into suitable sizes. Linoleum is of two kinds, plain and inlaid, the material itself being similar, while the after printing or treatment varies. Patterns are laid on the linoleum, the inlaid having them printed deeply by blocks, the components being fused under pressure and heat, and later treated to make a fine, polished surface. Nitrocellulose has also been extensively employed in place of linseed and cork materials. One prominent substitute for linoleum is felt treated with heavy bituminous material and then printed about as linoleum is. Patterns vary according to the designs of the artists employed and the vogue of the different types.

LITHOGRAPHY. Alois Senefelder, a Bavarian actor, discovered in 1796 the process of surface or relief printing from stone or metal. His invention received royal favor in Germany, where his printing shop at Munich (1808) became famous, and by 1810 also in England, and France. Artists took up the art, which had a great vogue until photography became a rival about 1860, but it was revived once more thirty years later, and flourishes now.

The process described. Lithographic crayon is composed of varying parts of soap, wax, oil, and lampblack, and the stone is blue or hard, gray or medium, and yellow or soft, Kelheim stone being a favorite class. Designs drawn, written, or otherwise outlined on transfer paper are placed carefully face down on the lithographic stone, after they have been softened between wet blotting or other paper for from 20 to 60 minutes. Backing or some hard material is placed for a time upon the top of this paper, from which the design appears on the stone, and is allowed to dry. Transfer to zinc or aluminum plates is made in a similar manner. Etching of the design is accomplished by a solution of gum arabic and nitric acid for a stone, and of gum arabic, chromic acid, and phosphoric acid for zinc, and the same less the chromic acid for aluminum. The etch solution eats away the part of the stone free from the drawing or design, which is left for printing; after further cleaning and treating with asphaltum, ink may be applied. *Lithographic ink* is a product of dry color and linseed oil, softened up somewhat, and applied with a roller, from which the impression must be uniform and free from foreign substances. Various colored inks are used.

Printing is accomplished by a sliding motion on paper that has been especially prepared. Though a flat-bed press is still much in favor, a rotary type has been a success. Metal is also taking the place of stone, the weight of which calls for more convenient mediums. *Photolithography* is printing from designs without the help of handwork, as in the Vandyke method. By this a line drawing or other form may be transferred directly to the stone without being first photographed, the drawing itself being used as a negative as in printing pictures. The direct method, a more advanced one, prints the negative directly on the stone or metal plate coated with albumen and bichromate. *Rotogravure* is a similar process of rapid printing of pictures from plates etched on copper cylinders. The negative is exposed to light in a partial vacuum, the plate is rubbed with cotton-wool, further treated, etched, and gummed for the press. *Chromolithography* or color printing is the process of transferring to stone the artist's designs, taking many good proofs on fine heavy paper, coloring them for printing, so that the lot together will reproduce the color and design of the original picture. See article on *Printing*.

LUMBERING. This term is now applied to extensive felling and cutting trees into material for use in building. Various methods are used, necessitating a crew of a few men or as many as 12 or 15 in a single gang. In large-scale lumbering one man marks the trees, two follow and cut them, others divide the trunk into logs, another group clears away the branches, and one or more clears up the forest after the main crew has passed. Directing the fall of a tree is important to save it and others from damage. This is accomplished by cutting a notch in the tree on the side toward which it should fall, and then by sawing through on the opposite side, while wedges are driven into the cut behind the saw to relieve pressure on the saw itself.

Transportation to mills. Logs are snaked to the roads, mills, or branch railways; now a snow locomotive or tractor with immense power is often employed in large forests. Logs are loaded on huge sleds by means of cables. Sometimes they are fed into sluices and carried by water for many miles, one in California being 53 miles long with branchings, the whole being handled by only two men. Often logs float singly down water courses to dams or mills, and when they get tangled "in a jam," drivers at great risk have to climb upon them, or stand in their path, and disentangle those holding the mass back. Laws forbid this method on navigable streams. Logs are held in ponds, small lakes, or behind dams sometimes till spring floods come to move them. Hundreds or thousands of logs are sometimes lashed together by chains to form immense rafts, often made up of sections or groups. Rafts 840 feet long, 50 wide, drawing 30 feet of water, and helped by chains weighing 175 tons have been successfully handled. Hard woods must be handled carefully lest they sink.

Sources and uses. Once the eastern states supplied ample quantities of lumber, and wood was lavishly used for fuel and incidental building, even for "corduroy" roads. With emigration westward the industry followed. Michigan, Minnesota, Colorado, Oregon, Washington, and California became in turn the source of large supplies. More recently the South, Maine, and certain scattered areas have been tapped. White pine, spruce, hemlock still are cut in the northeastern states; yellow pine and cypress in the South; redwood, pine, and other conifers in the west and northwest. Hard woods like ash, poplar, oak, hickory, hard maple are staples of the regions east of the Mississippi.

One of the oldest sawmills in the United States is at Lewiston, Me. (1770); several times destroyed by fire, but now a magnificent plant. Logs are sawed into lumber by circular or rotary saws, or by a number of up and down saws known as a "gang"; the mills are run by steam or water power. There are many portable sawmills which can be located where desired; heaps of sawdust reveal their visits. When cut the lumber is planed, the rough edges taken off and the boards matched, tongued, or grooved by machinery. There are machines for window sashes, wood molding, tenoning, mortising, boring, band and swing saws, sandpapering, and carving, there being little handwork in modern finished lumber. This has revolutionized interior decoration, placing artistic carving and scroll work within reach of almost every one. Lumber is also seasoned artificially, thus avoiding its lying idle for long periods at compound interest, and this still further reduces the cost of decorative work. See article on *Forestry*.

MATCHES. In nature and method of making, few products have changed as radically as matches have in 30 or 40 years. Early forms consisting of threads, tapers, or mere splinters of wood, need not be described. An alchemist at Hamburg discovered phosphorus in 1670, but the modern friction match was invented by John Walker, a druggist of Stockton, England, in 1827. The latter contained chlorate of potash, sugar, and gum arabic, but lighting was difficult and accomplished only by rubbing or drawing the match through sandpaper. "Lucifer" matches attempted to provide a striking surface on the box or container. In 1831 phosphorus was used in a match which could be lighted anywhere, but this had two disadvantages—it was too easy to ignite, and workers in factories were attacked by a terrible face disease caused by yellow phosphorus poisoning. The convention at Berne in 1906 agreed to abandon this type in all member lands.

Since 1900 a non-poisonous form (sesquisulphid of phosphorus) has been largely used. American matches now are made of pine and aspen wood, impregnated with a boric solution, and tipped with a small lighting surface, protected around it by material not easily set off. Birds-eye matches describe this tip in one species. Matches are now seldom made by hand or in simple units, but in large machines capable of turning out 50,000 to 100,000 a day. These automatically cut the splints, dip the heads twice in solutions made up of six or more components, and place them in boxes. The containers are made by other machines, in two parts, boxes and slide outsides, at the rate of 6,000 to 10,000 an hour. Truly the machine that makes the humble match is one of our most wonderful combinations of units, one type being 53 feet long, 10 wide, and 9 high, the weight of which is about 20 tons.

Safety matches were first made in 1855. Some elements are in the match head, and the inflammable or striking element is on the box itself, so that no other substance or surface will light the match head. Sweden has long had a government monopoly of the familiar small type, used almost entirely there and also exported in great quantity to all parts of the globe. The American types of book-matches, encased in cardboard for the use of smokers, are safety matches of quite similar make.

MINING. The delving of metals from the earth, existing from the earliest times. *Prospecting* is the searching for deposits of ore by examination of the surface and surroundings: samples obtained are assayed, and the probable value of the "find" estimated. *Staking claims* is a legal step to secure protection; consisting of marking out a patch of ground, varying in area according to the individual State provisions; averaging 1,500 feet along the vein, and 300 feet along either side, in most western states, and in the east a square 1,500 feet. *Working* a claim is developing it either by surface clearing, or by digging down into the ground forming a *shaft* and its corollary of passages, or tunnels, which follow the "lead" or direction of the vein; these passages are properly "timbered" to replace the natural support of the earth, ore, or water taken away; there must also be adequate ventilation. In *placer* mining the loose gold is washed from the gravel, sand, or mud, containing it, and in

the *quartz* mining the rock is *crushed* and *stamped*, and treated by the cyanid or by the chlorin process. The cyanid process consists in the use of a weak solution of cyanid of potassium when oxygen is present, while the chlorin gas is used after the ore has been pulverized, roasted, and moistened in tanks. Surface or *strip mining*, especially for iron, coal, and copper, is the process of removing the thin top soil, leaving the ores exposed, and these are lifted out by large steam or electric scoops, after which they are loaded in cars and transported to smelting centers.

Coal mining is somewhat different. Being deep underground as a rule, anthracite has to be mined by the shaft method. Softer coals are obtained by strip mining in a few instances, or by entering a hill from the side, or by shafting. All coal is graded by being passed over large sieves, but sometimes soft coal is marketed as it comes from the mine in a form called *mine run*. Anthracite is divided into several classes according to size and quality. Formerly impurities like slag and rock were sorted out by mine boys, but now in most mines special machines, delicately adjusted, do much of this work.

Quarrying is mining for marble or stone. The first marble quarry in the United States is said to have been at Dorset, Vt., in 1785; Marbledale, Conn., opened in 1800; Stockbridge, Mass., in 1802. The largest are Rutland, Vt. Marble produced annually in the United States exceeds $10,000,000 in value. *Marble* is a crystalline rock of lime, or lime and magnesia carbonates. There are many gradations and varieties in texture, capacity to "take polish," and color. The best American deposits are in Vermont at West Rutland, Proctor, Brandon, etc; at Lee and Pittsfield, Mass.; the marble for structural work coming from St. Lawrence and Westchester counties, New York, Maryland, and Georgia; black marble was once quarried at Glens Falls, N. Y. Nearly 80% of monumental marble comes from Vermont; the marble for furniture tops and interior decoration is largely from Knoxville, Tenn.; white and gray marble from California; the verde marbles from Pennsylvania, and the wonderful onyx from Arizona, and California, not true onyx but travertine, found in caves, or formed by the action of calcareous springs.

Ornamental marbles are largely imported; the black and gold from Italy, the yellow and red clouded Brocatelle from the Pyrenees, the white Carrara from Italy, the Giallo antico, a yellow type, and Griotte, a bright red, from the Pyrenees, although some of this is found in Vermont. The fossil trees much used in decoration have the wood cells replaced by silica of various colors, preserving the wood to a remarkable degree, and giving beautifully colored surfaces capable of taking a high polish. This silication was probably accomplished by hot alkaline waters carrying dissolved silica; there are usually evidences of volcanic activity in the region. The fossils are found in Maryland, south of Baltimore, along the bay front; in the Bad Lands of the Little Missouri; in the valley of the Yellowstone; in California, Arizona, New Mexico, and in Great Britain, Prussia, Egypt, and Antigua in the West Indies. There are many forsaken granite quarries in the United States, and some of these are being re-utilized by crushing the granite into meal and shaping it into cement bricks, urns, bowls, and for general building purposes. This granite is the "split blocks" which had been rejected as useless.

OILS. From the chemical point of view, oils are divided into three main classes: 1, petroleum and similar oils, resulting from destructive distillation of crude oil, shale oil, or coal; 2, fixed oils, fats, and waxes; 3, essential and volatile oils. The first class has been treated under *Petroleum;* the third, under *Perfumes*, in which they are chiefly used.

Fixed or fatty oils are all glycerides, of which the most common types are stearin, palmatin as found in tallow, and olein as in olive oil. In consistency they range from pure liquids like linseed oil to solids like beeswax. During the World War the glycerides became increasingly important and relatively scarce, for they form one basis of explosives, many remedies and medicines, preservatives, ointments, plastics, soaps, and textiles. Fats naturally subdivide into animal and vegetable. Their importance is shown by the statistics of world usage, many attaining a total of not less than 100,000 tons, and several of over 1,000,000. They are valuable in that they do not dissolve in water or alcohol, but may be reduced in ether, gasoline, chloroform, and other solvents.

Vegetable fatty oils divide into three classes—drying, semi-drying, and non-drying. Of this first sub-class, linseed oil compressed or extracted from the flaxseed, has long been a main ingredient of paint and varnish, has been used for poultices, and for making artificial and synthetic products like rubber and leather. It comes from Russia, India, Argentine, Canada, and the United States. Very similar is perilla oil, a product of India, Japan, and parts of north China. Great quantities of tung oil find their way into paints, varnishes, linoleum, and a kind of artificial rubber. Slightly different forms are known as China wood oil, Japan oil, and even India oil. Florida now produces a supply, which in time may be adequate to the needs of the United States.

Hempseed oil, common to parts of Asia, Europe, and America, is often used in paints, soft soaps, and low-grade varnishes. Poppy oil from Asia and Russia in Europe is used in salads and for making artists' colors; and sun-flower oil, produced on a big scale in Russia, Hungary, and China, is much used in soap and varnish. *Slowly drying* oils are numerous, the chief being cottonseed, soya bean, sesame, croton, and castor. Cottonseed passes under a number of aliases in salad or table oils, in oleomargarine, lard substitutes, in laundry soap, and in cattle feeds. In China, Manchuria, and Japan, soya or soja bean oil serves similar purposes to some degree, and attempts have been made to acclimate the plant in America. Sesame is used for food and soap; croton in druggist products; castor oil as a purgative (except in cases of chronic constipation and appendicitis), in making artificial leather, and other synthetics. *Non-drying* oils include almond, both the sweet and the bitter. Sweet oil is used for food, but it yields prussic acid, glucose, and oil of almonds. Olive oil is the familiar table product used for salads, soaps, and technical purposes. Peach kernel oil, peanut oil, and others are used in similar ways or as substitutes for more costly oils.

Animal oils include menhaden, salmon, and sardine, the first of which is so useful that 400,000 tons are produced in the United States yearly, most of it on the New Jersey coast. They are used in finishing leather, making linoleums, and in the steel industry. Cod liver oil has long been known as good for pulmonary ailments and in finishing leather; neat's foot oil for a high-grade dressing is the product of the hoofs of cattle; whale oil for fuel and arts; porpoise and dolphin for lubricants for delicate machinery.

Vegetable fats include cocoa butter, used in confectionery, medicine, perfumery, and soaps; cocoanut oil for food, soap, and illuminating; palm oil, best known in soaps, but also used in some lands for food; vegetable tallow, a curious product of a tree of China; and Japan wax, used in polishes.

Animal fats include butter, the chief substitute for which, however, is the product oleomargarine, made of both animal and vegetable elements. Tallow, lard, and horse's fats are used in varied ways, the first two mainly in food products, soap, perfumes, and salves. Certain liquid and solid waxes are also classed as fats. These include sperm oil (which contains no real glycerin), used for lubricants and leathers and sometimes for fuel; carnauba wax, used for polishing, for lubricating phonograph cylinders, and for candles; japan, chinese, bayberry, beeswax, montan, and others are used variously in making floor polishes, binders for some paint products, lithographing inks, and ointments.

Hydrogenated and special oils. Of late the process of hydrogenating oils has been adopted to reduce them to any desired degree of consistency. This method is useful to obtain more suitable oils from classes that do not readily harden. For edible products, soaps, and medicinal preparations where original odors might be unpleasant, hydrogenation reduces them. Cotton seed is made much more useful in this manner. *Intarvin*, a commercial trade product of synthesis, has been prescribed for diabetic patients. Oils for certain purposes are known in varied industries. Dolphin and blackfish oil are used for watches and clocks; the thinnest kind of oil for spindles (spindle oil); pure minerals emulsifying little for crank cases; paraffine or cotton seed oils for cutting-screws; rosin or mineral oils free from impurities for transformers; stainless lard or neat's foot oils for spindles.

Commercial oils. Of the many oils produced by one of the three processes for making perfumery, several will illustrate. *Bay oil* from trees in the West Indies is treated with alcohol, and the well-known bay rum results. *Eucalyptus* oil is much used in medicine, especially in dilute form, since its odor when pure is unpleasant. *Chaulmoogra* oil is a cure for leprosy in mild cases. *Geranium* oil is much used in perfumery and soap; it is a valuable source for terpene alcohols. *Cedar oil* is often distilled from shavings left after the manufacture of pencils. *Citronella* oil is much used for perfuming soaps, in technology, and for driving away insects like mosquitoes because of its strong odor. *Coumarine* is interesting in that it is found in the herb known as deer tongue, gives the odor of new-mown hay, and can be made from carbolic acid (phenol). It is much used in cheap perfumes, soaps, and as a substitute for vanilla. *Vanilline*, resembling natural vanilla, but not as complex a flavor, has been largely used as a substitute.

Artificials and synthetics. Practically all the odors of flowers, roots, and beans have been imitated. A substitute is the use of one material for another; it may or may not resemble the original. An *artificial* is a substance parallel to a real one, and so we have imitation or artificial perfumes and fruit compositions, like banana, cherry, pear, peach, apricot, raspberry, and many others. A *synthetic* is a chemical restoration of the elements of the natural product; it is the same except that it is made by man and not by nature. Sometimes, as in jasmine which is very costly, the real is mixed with the imitation. A few typical chemical synthetics with real products named in parentheses are these: amyl salicylate (clover), beta naphthol esters (orange blossom), coumarin (tonka bean), heliotropin (heliotrope), gamma undecalactone (peach), terpineol (lilac). Many of these

names, like other technical ones in chemistry, are the scientists' shorthand for telling what the composition contains.

PACKING. Ranking first in the value of products, the slaughter and marketing of meats at central points take on increasing importance. Many cattle are still slaughtered, cured, and eaten not far from where they are raised. Yet more and more the industry is centered at a few points, the greatest being Chicago, St. Louis, Kansas City, Omaha, St. Paul, St. Joseph, Milwaukee, Indianapolis, and Cincinnati, at which place packing began in 1818 and attained large proportions by 1860. Now the cattle are collected, herded into cars, transported long distances to market, the average for beef at Chicago being 700 miles. Cattle raising gradually has gone westward, so that now most meat is grown west of the Mississippi, but is consumed east of this river.

Slaughtering process. After resting the cattle about one day, the stock yards men follow a quick routine, so that the individual animal at Chicago, for instance, is handled at some point by over 200 butchers at a cost of less than 50 cents a head. It would take a single man 120 to 150 hours to perform the same labor, now divided into most minute gradations and at varying rates of skill and pay. The hides are cured and then sold to tanners. The carcass is split, the halves are washed, dried and then passed to cooling rooms, tremendous in size, and there held just above freezing. The parts are next put on cutting tables, moved slowly along, while each man does his part. Of the whole, 40% or more will be fresh meat, sent within two or three weeks to the trade, about 10% canned meat; 6% hide; and the rest various by-products.

Eventually there is 20% shrinkage, and 10% waste. Tongue, brain, heart, sweetbreads, and other portions are specially refined and prepared for some use. Glands and sinews are often used in pharmacy, hoofs for making glue and gelatine, hides for leather, hair for brushes, and so on down to the last useful ounce. Fat goes into soap, and some of the tallow into oleomargarine, which was first made in Paris in 1871, and now is produced in large quantities in Holland, where some of the oleo oil from the United States is utilized.

PAINTS. For centuries artists have made their own uses of paints. Ordinary commercial coverings for buildings of wood, stone, or iron were mentioned early, but until within the last two generations they were made without much scientific skill. Now great factories turn out paints in huge amounts that are true to analysis as to materials and color.

Common paints. Pigment, oil, and a drier compose most of our ordinary commercial paints. The pigment or material that gives the color comes from mineral, vegetable, or animal substances. The white varieties are made mainly from white lead, zinc oxide, gypsum, china clay, asbestine, silica, or lithophone. The chief kinds of blacks are lamp, drop, graphite, and ivory black. Blues come from ultramarine, prussian, smalt, cobalt, copper, and Chinese blue material. Ultramarine is used chiefly for violet. Some of the reds are chrome, lead, ochre, venetian, vermilion, carmine. For yellows we have the chrome, yellow ochre, cadmium, litharge, and gamboge. For orange the antimony, chrome, or other orange material; and for browns, the umbers, vandyke brown, and sepia. These natural or mineral substances, however, are gradually being superseded by the artificial or synthetic colors. The latter is the same in chemical composition, can be refined and stabilized better, and can be controlled more readily as to shade, consistency, and wearing value.

Linseed oil is the old reliable kind made from pressing the seeds of the flax plant, because it is cheap, relatively easy to keep, and is safe to use and apply. Uniting with the oxygen of the air, it soon becomes a pasty mass, and then gradually hardens to form a coating that protects the rest of the paint material. Other kinds of oil now used for certain types of paint are tung (china wood oil), largely employed in lacquers and other quick-drying paints. Artists often use poppyseed oil or walnut, because it does not readily crack when dry.

When we want paint to dry quickly, some additional drier is used. This is made by boiling oxides of lead and manganese in linseed or resin, after which the mass is thinned with spirits. Cheaper driers are made of resin, lime, and lead oxid, thinned with benzine or some other substance to thin the resin. Turpentine both thins and helps to dry paints. When 5% of lead oxide is mixed with the linseed oil in paints, they will dry in less than eight hours; otherwise, it takes two or three days.

Some special paints. Among the many other types of paints are enamel, anti-rust, anti-fouling, metallic, fire-resisting, and the lacquers. Ordinary enamel contains varnish, and some have resin, for indoor use; and for outdoor and slow-drying types, linseed oil and some copal varnish. The more varnish is used, the more glossy the paint looks; flat or non-glossy paint contains more turpentine. See the article on *Varnishes.* For bridges, steel beams, and other iron that needs protection from rust, graphite, bitumen, red lead, or some similar substance is mixed with a coal tar solvent. Poisonous material like white arsenic, mercury oxid, or some copper compound, is often used on the bottoms of ships to prevent the formation of barnacles. Metallic paints like aluminum, gold, silver, and bronze are made by combining powdered metals or alloys with either copal or celluloid varnish. Fire-resisting paint, of which the metallic is one kind, has asbestos, borax, or some other mineral in it that will not burn. Lacquers, which dry with a fine luster in a short time, are composed of fine pigments ground in some form of nitrocellulose. Though these are highly inflammable, they are now in great demand.

PAPER. Material on which to write was made of the papyrus by the Egyptians and other eastern peoples long before the Christian era. Before 100 A. D. the Chinese learned how to make paper from rags, their source of information being possibly India. China had printed books before the year 1000, long prior to the invention of Gutenberg, Füst, and their companions. The Arabians passed on the art of making paper to the Spaniards, thence to Holland and nearby lands, notably Germany where mills appeared before 1400. England issued the first patent in 1665. William Rittenhouse, a Mennonite bishop of Philadelphia, set up the first mill not far from Germantown, Pa., and contracted with William Bradford of Philadelphia and later of New York to sell his entire output. Until about 1700 the Rittenhouse family had a virtual monopoly. Philadelphia long led in the industry. By 1783, the close of the Revolution, there were about 80 mills, and in 1810 possibly 200. Massachusetts, Connecticut, and even far-away states took up the industry, located in the great river valleys for the most part, where supplies of water and material were good.

Commercial importance. From these rude beginnings, paper has become a basic, nation-wide product, illustrating the literacy of the nation. The United States consumes over 150 pounds annually per capita, Great Britain, 75 pounds, Germany 43, Scandinavia, 33, Japan, 11, and Russia only 5. In 1780 we had 38 daily papers, circulating but 48,000 copies a day, and now we have nearly 20,000, of which every fourth person buys a copy each day. For one Sunday edition a large metropolitan newspaper of 18 pages requires 170 tons of paper, enough to fill five freight cars; and one New York paper uses up over 2,000 acres of forest every year in furnishing material for newsprint. Scarcity of forests is almost upon us, and greater production or substitution may be a real problem for the next generation. Scores of uses of various kinds of papers increase the demand for good stock or paper material.

How paper is made. All paper is essentially a fibrous product, as a minute examination of a sheet shows many hair-like fibers bound together into a mass. Formerly it was made of rags, such as the cotton once used by the early Moors of Spain; but be it of linen, cotton, or any other rag basis, it is fibrous. Since 1844, when the first wood pulp was made into paper in Saxony, the decline of rags has been gradual, and the rise of different direct wood types most rapid. Still the finest papers today are made of linen stock. All natural fibers potentially may be materials for paper. At present, cotton, linen, and wood pulp make up the bulk; but others have proved a possibility. Unlike most products, little is left from paper for remanufacture, only less than a fourth being returned to the mills in form of waste. Besides the fibers already noted, paper can be made from flax, jute, hemp, mulberry, manila, corn, wheat, bamboo, sugar cane, and cotton. Interesting developments are newsprint paper from corn stalks and from cotton seeds, possible sources of supply when wood materials become too scarce and too expensive. Copies of newspapers and magazines have been printed with some success on corn-stalk paper. Woods commonly used as basis for paper are spruce, pine, hemlock, and poplar. Peat also, in its original mossy form, has been used for making stock. Cheap grades of wrapping paper are made on commercial scales from wheat, rye, and oat straw.

Wood pulp paper. Two processes in making pulp paper are in common use, the mechanical and the chemical, the former being responsible for nearly two-thirds of the total output. In both the logs are first dried for a time, sent to the mills by rail, water, or other means, and cut into portions. For the mechanical process the bark is removed and the logs then cut into two-foot lengths; for the chemical, the logs are mechanically cut or broken up into small chips. In the former, the lengths are held by hydraulic rams against swiftly revolving stones which grind the wood into finest fiber; water is kept running on the stones and wood to to prevent heating by friction.

After impurities are removed by sluicing and screening, the mass is moved on to the digesting process, which from now on is the same for both the chemical and the mechanical kinds. In successive stages it is beaten, ground, and separated until the finest texture of the mass is obtained. Then it is ready for the refining, which consists of further beating to make all fibers of uniform texture, then dyeing, sizing, and processing to make the different grades of paper stock.

Paper machines consist of a series of rollers or cylinders, designed to perform these operations: Collecting the pulp

on a felt or wire screen, draining off the water, pressing the mass firmly together to make the texture even, making a thin continuous sheet comparatively free from specks, or other impurities. Now the ribbon of paper passes through three sets of drying rollers, one to smooth out the marks of the felt or wire, one to press it tighter together, and a third to put on the smooth, polished finish, which is accomplished under tremendous pressure. Machines are set to produce the thickness of paper required, as indicated by the weight per ream, as 12, 14, 16, 20, and 24 pounds to the ream. These machines are well-nigh human, the commonest one being the Fourdriner, which is about 180 feet long, 18 wide, and 16 high, with a capacity of 500 feet of ribbon paper a minute. A man without such machines can make 200 sheets of fine paper, or 1200 of coarse a day. Some reducing companies make only the pulp, which is sent in pressed dried sheets or boards to the makers of paper. Of the chemical pulp, the reducing agents are sulphite, soda, and sulphate. The sulphite contains sulphur, pyrites, lime, and limestone; the sulphate contains lime, salt cake, and caustic soda; and the soda contains lime, soda ash, and caustic soda. Fillers for paper are clay, chalk, and talc, these being used to bind the fibers together. Bleachers are bleaching powder, salt, lime, and liquid chlorin. Sizing materials are resin, soda ash, alum.

Kinds and uses of paper. Newsprint contains a high proportion of mechanical or the cheaper pulp. Book papers are more carefully made of a larger part of chemical pulp, some of which may be specially treated, bleached, and coated. Fine paper is made almost or entirely of chemical pulp; but the best grades for bank books, bonds, checks, and documents are made from rags. Common wrapping paper is made of a combination of wood pulp, jute, old rope, straw, and waste products from making higher grades. It varies in texture and color according to the material or artificial coloring or bleaching agents. Paper board is made from material like those of wrapping paper. Building papers are fibrous compositions of sugar cane refuse, corn stalks, and sometimes other coarse stuff. Tissue paper for use by jewelers is made of old rope, and other types from pulp high in mechanically prepared wood. Papier-mâché is a composition of wood pulp, glue, oily material, and other substances, which are pressed into forms and molds. Vegetable parchment is made by running unsized paper through strong sulphuric acid and then drying and pressing it on rollers after it has been thoroughly washed in water. It is used for diplomas and other documents in imitation of the real sheepskin or natural parchment. Cellophane or extremely thin transparent wrapping paper for candy and other products is made by precipitating the cellulose hydrate of viscose or paper pulp. Vulcanized fiber is produced by a similar process, but several layers are pressed together to form a thick sheet, such as used in making waste baskets and other containers. For other materials made from pulp, see the article on *Cellulose*.

PERFUMES. Among the interesting products of nature are perfumes, the odors of which are intricate, chemically elusive in many cases, and often hard to imitate. Fragrance is sometimes located in the flower of a plant, as in carnation, clove, hyacinth, rose, and lavender; sometimes in the stem and leaves, as in peppermint, geranium, and verbena; sometimes in the wood, as in camphor, cedar, cinnamon, and sandal; or in the root, as in sassafras; or in the fruit, as in lemon and orange. Wherever the odor may be, it is due to some essential oil, which seems to be going through some chemical changes. Perfumes might be divided arbitrarily into four classes,—vegetable, animal, imitation, synthetic.

History and production. From the dawn of civilization certain odors or perfumes have been mentioned. India used the cus-cus or vetiver grass, which today is used in azurea or other "bouquet" or combination perfumes. Confucius mentions perfumes in 480 B. C. Incense, as of joss sticks, has been known in China since ancient times. Egypt was lavish in perfumes, ointments, and essences. Greeks and Romans, like the rest, had perfumes, which in all these ancient lands consisted of drug or other substances not distilled. Avicenna, an Arab sage, is said to have invented the distillation process in the tenth century, when he made rose water and rose oil, still produced in Bulgaria, Persia, and France. Early it was known that fats take up certain odors and perfumes, but little was made of this in practice, one old method being to collect steam from heated plants in wool and squeeze out the oils.

Modern methods include distillation of steam, maceration or crushing, and extraction. Modern plants provide for use of a ton of lavender flowers or peppermint leaves in a single still. Citrus fruits are treated by some form of crushing or rolling. In many instances, heating or maceration would injure the perfumes. In France *enfleurage* is a favorite method. This consists of painting both sides of glass with a fatty or oil substance, usually beef or pork fat, and on this is laid the petals when they are fresh. Others replace these when the first lot becomes wilted. The process is used especially for jasmine and tuberoses, one ounce of the former being worth from $15 to $30, according to the crop of flowers. When the fats, which are called pomades, are saturated, the oil is extracted from them. In many cases, however, volatile solvents are used in retorts for extracting the essence; alcohol is often used, and when this is distilled off in a vacuum, the remaining oil is called absolute flower oil.

Particular perfumes may be used to illustrate these processes. Acacia is prepared by macerating, with olive oil, and then extracting with alcohol. Carnation is extracted by the pomade or fat process. Natural hyacinth oil is extracted by means of volatile solvents. The absolute oil of lilac is not used, and its form is not known in chemistry; the odor we buy is really an imitation. Mimosa tree perfume is highly prized, and the oil is obtained by the volatile solvent method. Orange flower perfume comes from the flowers by use of the extraction by pomades or by solvents. Rose is commercially known as otto or attar of roses, but this is not a pure extract.

Animal perfumes. Musk is the best known perhaps of these, it being a product from the musk deer of high altitudes of mountains in Asia, and prepared in certain districts of China. Ambergris, valuable in fixing odors in perfumes, is a calcareous morbid secretion of the intestines of the sperm whale. Sometimes it is found floating on the water, and sometimes it is taken from the dead animal. Because of its value, sailors are constantly looking for pieces. Civet is a glanular secretion of civet cats of Asia.

PETROLEUM. The industry may be divided into four divisions: Producing, refining, transporting, and marketing. Prior to keen competition within the industry, each division was more or less a separate unit. Competition has compelled the different organizations to unite so that the successful firm today carries on all four operations.

Petroleum is a mineral oil which varies in color from yellow to black, usually a dark green liquid which may be as thin as kerosone or as thick as molasses. There are two theories of petroleum origin: hydrogen and carbon united under great heat and pressure; or oil is of organic origin, the remains of minute vegetable life of historic times. The latter theory is the opinion of the majority. It is found in many parts of the world, occurring undergound in porous layers of sand or limestone. The porous layer is always covered by a hard layer such as shale which prevents the oil from escaping. Petroleum consists of two elements, carbon and hydrogen. While simple in constituents, it is complicated in structure inasmuch as the molecules combine in so many different ways that crude oil yields gas, gasoline, kerosene, lubricating oils, and many other by-products. The advent of the automobile changed kerosene to gasoline as the principal product.

Oil is sometimes found floating on the surface of certain springs, and in the early days both the Indian and white man believed that it had medicinal properties. The first successful well was sunk at Titusville, Pennsylvania, by Col. C. E. Drake, August 28, 1859, and now the United States average production approximates 870 million barrels a year, about 70% of the world totals. Since the first well was struck in 1859, the United States has supplied 65% of the world total in the aggregate of all years. The chief fields in the United States in order of size of production are the Mid-Continental, California, Gulf, Appalachian, Rocky Mountain, Illinois, and Lima-Indiana. The chief states are Texas, Oklahoma, California, Kansas, Arkansas, Louisiana, Wyoming, and Pennsylvania. The total yearly production in all states is over 40 billion gallons.

Producing. The modern prospector has various detecting instruments such as the *seismograph*. By setting off a charge of nitroglycerine on the earth's surface, the progress of the sound waves as they go underground are reflected on the seismograph. Perfection of the seismograph in the last year or two enables the prospector for oil to know conditions ten thousand feet below the ground. When surface indications are lacking, the simplest method is the drilling of a test well. The driller examines all samples of the earth through which the drill passes. This describes to him the rock formations he is penetrating. The drill itself is a heavy piece of carbon hardened steel culminating in a cutting blade. One common form is the *fishtail* shaped drill which is particularly efficient in cutting through softer rock. The most modern drilling is performed with a *rotary* drill which spins as it bores and might be compared to a propeller except that it revolves through sand and rock. In the United States oil was first struck at 69½ feet; in recent California fields it has been struck as deep as 7,210 feet. The cost of a well ranges from less than $2,000 to more than $500,000. In 1859, the first year of oil drilling, two wells were completed. Since that time nearly 800,000 have been sunk. In 1928 there were 22,331 new wells completed: 56% found oil; 12% found gas; 32% were dry.

The crude petroleum as it comes from the wells may be used for making water gas, for oiling roads and for fuel, but it is the refining process which gives oil its great value. The principal products from the distillation of crude oil are naphtha, gasoline, kerosene, paraffin, white oils, gas oil, fuel oil, grease stock, pitch, asphalt, and wax.

Refining. The process of extraction may be separated into two divisions, natural refining and forced refining. Natural refining is a simple process of distillation. If you put a mixture of alcohol and water in a kettle and apply

heat, all the alcohol will boil off before the water boils because alcohol, more volatile than water, has a lower boiling point. The same principle applies to the various types of molecules which compose petroleum. When crude is heated the lighter molecules, those with a higher proportion of hydrogen, are the first to vaporize. The first substance to be given off is the *natural gas* contained in oil, then *gasoline*, then *kerosene*, then *gas oil* and then *lubricating distillates*. The residue is still fuel oil, asphalt or coke, or in the case of certain high grade crudes, cylinder stock is the residue. The main question now confronting the refiners is the proportion of gasoline that can be extracted from a given amount of crude. As the distilled vapors are given off from the boiling oil, they go through a cooling system and are again condensed into liquids. A "still man" can tell by the size and color of the liquid stream, also by frequent sampling, when it is time to decide that what is going through has ceased to be gasoline and has become kerosene. The line of differentiation is variable as gasolines differ sharply according to their end points.

Cracking process is based on the fact that heavy molecules of petroleum, the molecules in turn being made up of many atoms of carbon and hydrogen, when subjected to sufficient heat (825° to 925°) and pressure, crack up into lighter molecules. The percentage of gasoline molecules that are thus split off vary with the efficiency of the various cracking processes. The Holmes-Manley process used by the Texas Corporation yields considerably better than 50% gasoline to every barrel of crude.

Hydrogenation. This is the most interesting development in the refining field today. This process involves the addition of hydrogen to carbon to make a synthetic hydrocarbon. In other words, a synthetic gasoline. It is claimed by the promoter of this process that from hydrogenated crude an amount of gasoline can be extracted equal to the amount of crude. No hydrogenation process has as yet reached a stage of commercial importance.

Transportation. This considers the question of transporting the crude oil from the wells to the refineries and further transportation of the refined products from refineries to the whosesale and retail points of distribution. Transportation is carried on by three methods, *pipe lines*, *tank cars*, and *tank ships*. Inasmuch as the refinery may be miles from the oil field, the oil is of no particular value until the well is connected with the pipe line through which it is forced by pumps erected at different stations along the pipe line to the refinery. The pipe line is by far the cheapest form of overland transportation and some idea of its extent can be made by comparison with the Pennsylvania Railroad which controls approximately 26,000 miles of track while the petroleum industry as a whole operates approximately 100,000 miles of pipe lines. Originally, pipe lines were solely used for the purpose of transporting the crude oil to the refineries, and the flow was entirely eastward to the great centers of population along the Atlantic Coast. With large cities developing in the midwest it has now been found that these pipe lines can in turn be used to transport the refined product, gasoline, from the east to the west. The large refineries and consuming centers being on the Atlantic seaboard, tank ships were found more economical in the transportation of crude from the Gulf and California fields and from South American fields.

Marketing. With the increase of automotive transportation, methods of distribution have kept pace with demand. The corner filling station is as familiar as the road itself. One company boasts that no person need be more than ten miles from one of these stations in making a tour across the country by the Lincoln Highway. Marketing of the many by-products of the oil industry has also become efficient and highly developed.

POTTERY AND PORCELAIN. Sun-dried objects of clay were made in Babylonian times. Ancient inscriptions were on clay tablets. China, Egypt, Greece, and all other progressive nations early had their beautiful designs molded, colored, and carefully baked. Egypt developed from unglazed types to reds, blacks, vitreous copper glazes, and finally to superb turquoise blues. Greece excelled in both form and color; the Chinese in porcelain; the Romans in a peculiar outer red coating, not now explained as to process. About 1580 the Florentines imitated the older Chinese pottery, and also developed a style not unlike opaque glass. Though the Romans claimed to have invented the potter's wheel, in western Europe its use became general only after 1800.

Wood and pewter utensils were popular in America before 1800. After 1825 firms sprang up in eastern Pennsylvania and New Jersey, and this industry followed settlements westward across the country, until now some of the best works are in West Virginia, Ohio, Illinois, Wisconsin, Arkansas, Colorado, and the Pacific states. Common white earthenware is still the staple product; but artistic china dishes, bathroom fixtures, now many of them in color, electrical supplies, cabinets for medical and surgical use, and a host of little objects make up other established classes.

The potter's art. Little modern change has been made in the wheel used by the potter, known in Biblical times, for it is still a circular disk, propelled by hand, a foot treadle, or by machinery. This whirls the clay around, while the hand of the potter fashions it into the pattern he chooses, sometimes by the use of instruments like spatulas, sticks, or other small objects. Other methods are by jiggers or molding machines, by pressing mechanically, or by casting. Sometimes designs are treated in lathes, are embossed, carved, or colored while in the wet or damp state, and sometimes they are treated again after being fired.

Common white ware. In America the common white dish, cup, or plate is composed of about 40% white clay, 12 of ball clay for consistency, 33 of flint for porosity of the ware, and 15 of feldspar as a flux for glazing. These materials are ground finely with utmost care, stirred, strained, and then compressed, and finally made into balls or rolls, ready for the potter to work, press in molds, or cast as his particular art requires.

Glazing of pottery is accomplished in varied manners. Once alkaline glazes were common, especially in the orient. Lead is most common today, but feldspars are used in hand-fired porcelains, and even common salt in some cheaper wares. Coloring is by using clays of different natural hues, by mixing with artificial dyes, by glass glazing in blue, green, yellow, or almost any other tint or hue at will of the makers. Special enamels, and metals like gold, silver, and platinum are now fired into the piece of pottery in making it.

Names for *styles of pottery* are numerous. Some wares have geometrical figures on them, like red on black or other darker backgrounds. Other named kinds are *bucchero*, or Etruscan black; *Arretine*, or red with figures upon it in different colors; Italian or other majolica; or earthenware coated with opaque tin glaze upon which colored designs were baked; various Chinese wares named for the dynasties in which they flourished; *faience*, a florid, polychrome and figured type, often found in large figures and plate designs; *grès*, resembling somewhat the best dark porcelain; and various stonewares. Particular names are the earthenware or Delft of Holland; the Staffordshire and Wedgewood china and porcelain of England; the Sèvres of France.

REFRIGERATION. In its different phases, this includes the storage and preservation of foods as in packing plants and refrigerator cars, the making of artificial ice by any method, and air cooling and purifying in buildings. Mechanically it is the process of removing heat or of transferring it to some other form or substance. Heat is both sensible and latent, and refrigeration disposes of both kinds. Some substance is needed to evaporate quickly, and by so doing to carry away heat from a substance nearby.

Agents and methods. Refrigeration is accomplished by ammonia, carbon dioxide, sulphur dioxide, methyl chloride, and air to some degree. Both gases and brines are used. Though ammonia has been most popular, it is explosive at times, corrodes copper, and must be tightly contained. Though carbon dioxide has none of these faults, it must be highly compressed, requiring elaborate machinery. In the common household machines sulphur dioxide is most often used. All refrigeration is accomplished by a compressor, the object of which is to make the gas effective at a temperature about equal to that of the atmosphere. There must be also a condensing system, which usually consists of pipes or tubes, the object of which is to cool down the air and the liquid used as a refrigerant. The whole process is similar to that of a steam boiler, only reversed; the object is to remove heat rather than to inject it into the water to be heated. Water is usually reduced in temperature by aerating in the open. Refrigerating machines are automatic, being controlled by a thermostat. Brine is sometimes used in large tanks, into which metal containers of water are placed, and the cakes after freezing are removed from the cans and stored in rooms at constant temperatures. Calcium and sodium chloride are commonly used.

Uses. Cold storage is typical of refrigeration. Temperatures in warehouses, cars, and iceboxes are kept down to a minimum according to the product being preserved. Large cars now hold complete animal carcasses, or packing products in any form. Nearly 7,000 car loads of refrigerated foods are consumed in New York each week. At least 80% of carcasses in packing plants require refrigeration for a short period before they are cut up or shipped. Meats to be kept for a long time—months or even years—are frozen solid. Liquids like cider and other fruit juices may be kept for months in a frozen condition and then melted for sale when needed.

Air conditioning is accomplished by making the proportion of moisture, heat, and air most comfortable for human beings in a room. Air is humidified mechanically by two or more processes. Sometimes a fine mist is sprayed into a room; a better method is to pump into a room a quantity of saturated air. Drops of water are removed by special metal plates which refuse to allow them to pass, and so only the vapor gets into the air. Dust is often removed from the air by cloth filters moistened with some liquid or viscous substance. Several systems for treating the air in theaters, office buildings, and other places were crowds congregate have been patented. Some of these are built so that air is cooled several degrees and humidified in a very few minutes.

Household refrigerators are of two types, those supplied with ice directly, and those cooled by circulation of brine. In either case the chambers should be relatively tight. The refrigerant is circulated through coils, taking the heat from the air just the same as in large systems, after which the liquid leaves the box and goes back to the supply tank through a condenser coil, which removes the heat again.

RESINS AND PITCHES. For the sake of convenience, several substances not truly resinous will be included in this article. Certain gums, for example, are easily distinguished from true resins, in that they char and smell like burned sugar when ignited, whereas resins burn with smoky flame and aromatic odor; they also form jelly in water, but unlike resins are enacted upon by spirit and turpentine.

Kinds of resins. These consist of exudations from trees, fossil remains, or artificial or synthetic combinations. Most true resins come from tropical Africa and the East Indies. Fossil amber from fifty or more species of coniferous trees of past ages are found in Prussia, Courland, and in very small quantities not commercially important in New Jersey and Maryland. When resins are mixed with oil of a tree or other growth, they are called oleoresins, such as benzoin, tolu, and storaz. The *copals* are important recent or fossil resins, derived from trees or from earth deposits, of pale or yellow tinge, insoluble in alcohol, partly in ether, slightly in oil of turpentine. The various forms, like most resins, are much used in making paints. See article on *Varnish*. *Dammar* is valuable because of its light color, easy solubility, and use in turpentine preparations, thus making a good spirit varnish. *Mastic* from the shores of the Mediterranean, like others being gum from a tree, is much used by artists for picture varnish.

Lac is supposed to be an exudate from insects that live on certain Indian trees like acacia, mimosa, and ficus. Lac red dye is secreted by the female insects. In various forms like lac-stick, seed lac, shellac, garnet, and other lacs, it finds many uses. The word *lac* in Indian means 100,000, referring to the myriads of insects that exude this substance. *Shellac*, as we know it, is related to lac itself just as flour is to wheat; for it is a manufactured product, often diluted, imitated, and changed. It is made from seed lac, placed in bags and heated, and the molten lac exuding is drawn out into thin sheets of orange color. *Cumarone* resins, artificial products, are sometimes used for cheap varnishes.

Gum resins. Gum arabic and similar forms come from the acacia trees of Africa. *Myrrh*, so often mentioned in Scripture, is a gum resin, like all kinds composed of gums and resins, with some particular treatment. *Agar-agar* from algaic plants has been extensively used for sizing cloths and for making cultures in laboratories for growing bacteria. *Iceland moss* and *Irish*, often used for food and in textile and leather making, come from jelly produced by a seaweed. *Gum tragicanth*, another gummy exudate, much used in making pastes and in calico printing, comes to us in white, wavy flakes. Particular oleoresins are Canada balsam from the Canadian pine and Strasburg turpentine from the silver fir.

Turpentine is a chief oleoresin product, derived from pines from North Carolina to Texas and also in France. In America the trees early in the season are scored every week with a U-shaped iron tool, and the liquid flows down to the bottom where it is collected in a "box," which fills in a month or so. The product at last is gathered in barrels. Turpentine substitutes are made of petroleum mixed with some real turpentine. Spirits of turpentine is distilled from the crude liquid. Resin or colophony remains in the stills after the oil of turpentine is left; it is a solid, brittle, and acid product, of which there are at least 150 varieties, each derived from a different product or in a different manner.

Pitches. Asphalt or bitumen is the most familiar of the natural pitches, the chief supply of which comes from a lake on the island of Trinidad, 135 feet deep at the center and covering 127 acres, the total being estimated as several million tons. Smaller deposits in Venezuela, Cuba, Syria, Colombia, Oklahoma, and Utah are of less value. The main uses of natural asphalt are for roads, resilient surfacing, insulations, weather-proofing, paints, and japans.

Ozokerite pitch mined in Galicia is an earth wax much like ordinary paraffin, supposed to be the result of evaporation of petroleum pools. Several artificial pitches are used in commerce, obtained by destructive distillation of coal tar, petroleum, wood, vegetable oils, wool fat, and bones. They often closely imitate natural pitches. *Coal-tar pitch* results finally from the process of distilling or fractionating at very high temperatures. *Petroleum pitches* resist acid and alkalis, have good sheen, adhere well to surfaces, have high electric resistance, and excellent insulating properties. *Stearine pitches* from fatty acids, vegetable or mineral oils, are often used in waterproofing paper; bone pitch, always intensely black, is used in varnishes; wool grease pitch is used mainly for lubricating.

ROADS. Usually a way through the country or a thinly settled territory is called a *road;* an improved way in the town or city is a *street.* Ancient roads were tracks through the sand. Greece lacked good highways and could not hold remote provinces together, but Rome learned to build fine roads for military strength. In modern Italy, France, and England are certain Roman roads still in excellent preservation. The famous improved road, the Appian Way, running south from Rome, dates from 312 B. C. In the last decade in England certain old Roman roads have been repaired and improved, and a few have been restored to use; some have needed little upkeep for two thousand years. Roman roads in Britain consist of a deep layer of common stones; then one of rubble or masonry, not unlike modern concrete; then a third layer of finer mixture; and finally a topping of blocks of stone carefully fitted together. Such roads are almost eternal, some being three feet or more thick.

No fundamental improvement was made in new highways until almost 1800. Most English roads remained about as they were, except for the effect of travel and crude local improvements. For a vivid picture of the terrible state of roads, read chapter 3 of Macaulay's *History*. Between 1783 and 1815, a Scotch engineer, J. L. McAdam, put into practical use a system of using broken stone, covered with a binding material, and then topped with some finer substance. He was allowed to try this near Bristol between 1815 and 1818. Success led to formation of over 1,000 distinct local road corporations before his death in 1836. Greatest improvement has been made in Great Britain since 1909, for in England especially, several great trunk lines have been improved, some being 30 feet wide, with bypaths for pedestrians, and shoulders beyond.

Early transportation in America was largely by horseback. It required weeks to journey from Georgia to Washington, D. C., or from Maine to New York. In 1754 it took a stage seven days to go from Boston to Philadelphia, and as late as 1794 travel from Albany to Canada had to be made largely by water, which in most early settlements was a chief route of travel. Next came the worn trails, many of them following Indian paths, followed by plank, log or "corduroy," and brush roads, and in some remote districts today plank, log, brush, bark, or hay roads are being used. By 1830 about 20 main roads were in use east of St. Louis and south of the Great Lakes, but they did not reach what is now Chicago. From New York to Boston two roads were finished, two across southern Pennsylvania, and one across the northern part of New York; one from Washington northwestward through Cumberland, Maryland (the Cumberland Road, now part of the National "Pike"); two southward and west, branching to New Orleans and St. Louis.

Beginning in 1792 Pennsylvania constructed 68 miles of stone road from Lancaster to Philadelphia, and by 1828 had 3,100 miles of improved roads. New England, New York, Virginia, and South Carolina early voted large sums for road improvements. Gradually by national appropriations, the Cumberland Road was pushed to Wheeling, West Virginia, where for years a great trade in wagons ensued (5,000 in first five years), then into Ohio, and finally to southern Illinois, the last appropriation being made in 1838. This then was the great artery on land to the west, ending at St. Louis. Meanwhile the railway became a competitor, and the building of stone, permanent roadways—except in scattered places—ceased till the days of the bicycle and automobile.

Western Trails. For several years after the purchase of the Louisiana Territory, exploring parties penetrated beyond the Missouri, and Missouri became a state in 1821. In 1822 a wagon train passed from the Missouri to Santa Fé, the beginning of the road known as the Santa Fé Trail, establishing once for all communication with the great southwest and making possible new possessions in 1846. St. Louis was terminus of all western roads, the center of the fur trade, a distinction still held by that city. The Oregon Trail originated at Independence, and pushed through what are now parts of Nebraska, Wyoming, and Idaho, on to Oregon and Washington. The Mormon Trail from Council Bluffs, Iowa, joined this one in Wyoming and went on to Utah; and the California Trail, branching off in what is now southern Idaho, passed on to San Francisco. Trade in furs and the gold rush helped develop these highways. From the days of the Conestoga wagon on the National Highway from Pennsylvania westward to those of the covered wagon on the plains, highways were beaten down by hoofs of faithful horses and eager men seeking homes toward the setting sun.

Modern highways. Of course, there were other trails and roads, more or less passable—in bad weather very much less—in eastern states. Today Uncle Sam has a network of 3 million miles of roads, enough to belt the earth 120 times. Traveling at 35 miles an hour continuously, an automobile would need 10 years to cover all of them once. Already hard surfaced roads include 150,000 miles of national and state improvements, and 500,000 or more local roads that are at least graded and quite good except in bad weather. States that lead are Indiana, Ohio, Wisconsin, New York, Minnesota, Illinois, Michigan, Texas, North Carolina, and California. Illinois, which has a wonderful system of pavements, in six years completed 4,760 miles of surfacing, 1,246 miles of other grading, and 1,106 new bridges. Other states have followed, though on a smaller scale.

Road Upkeep. Naturally the common *dirt roads* require considerable upkeep in a single season. They are improved in numerous ways. In olden times local men worked the

roads instead of paying a poll tax, and in most cases little more was done than to fill the holes or renew ditches. Now various devices are used: Roads are scarified, scraped, leveled, crowned, and finally dragged until they are smooth. Twenty or more smoothing machines are used, all the way from one or more simple planks or boards to elaborate and expensive patent highway machines. Both Wisconsin and Minnesota, for example, have adopted a standard form of drag, not elaborate but rather efficient. Some counties in other states use different types side by side. Dirt roads are also treated sometimes with gypsum, clay or gumbo, screenings, cinders, or other material, without digging them out or laying a solid foundation.

Next come *gravel roads* of various sorts. Sometimes the roadbed is carefully prepared by scraping and leveling, and the different courses of gravel and fine stones are mixed, the whole being topped with dust or fine dirt, and now and then with an oil or tar surface. Draining is important for all-weather roads, which must be covered deep enough so that the soil or sand may not work to the surface in rainy weather. Binders or tops are made of iron oxide, silica, gypsum, stone dust, or suitable hard clays. If the traffic is not too heavy, and the binder is kept in place by dragging or some other means, a good gravel road compares quite favorably with some harder surfaces.

Next in order comes *macadam*, harder than gravel, and carefully made at greater expense. Next to gravel, of the better roads, it is least expensive to build, but at times deteriorates too rapidly under severe usage and bad weather. Modern macadam roads should be tight enough to keep all surface water from penetrating the foundation or subsurface. Best construction removes the top entirely; builds a foundation four or five inches deep with stones, which are rolled down mechanically or beaten down by traffic; and finally tops the whole with some tar product, covers this with sand or dirt to absorb the excess, and then rolls all again.

Bituminous roads are a form of macadam, oiled, or surface treated highways. Sometimes dirt roads are oiled or tarred. New England, for instance, has built a very satisfactory road with a foundation of gravel or small stones, scarifying the surface, rolling, covering with a coat of light tar, allowing this to penetrate for several days, surfacing again with tar, and then covering with dust or fine gravel to take up the excess. Such a road is like a macadam, save that the undersurface is not prepared with stones. It will last as long as heavy traffic will not break through. Wisconsin has tried a similar but heavier mixture. *Asphalt* is a form of bitumen, very familiar in city pavements, but not so common in the country. It has been used, however, in carpet form over macadam or even over gravel. Sheet asphalt is composed of the pure tar and some fine binding mineral substance. Asphalt is frequently used as a cover for brick pavements to protect them, or between bricks to bind them together, or in patching concrete temporarily.

Block pavements are of several types, such as brick, wood, stone, or rubber. Wooden pavements, once popular, are now seldom laid in city or country construction. Good brick pavement is now laid on some firm base, the most common one being cement or concrete; once it was laid directly on the ground or sand, but this type does not hold up under modern, heavy traffic. Other bases for bricks are gravel, macadam, bitumen, or heavy non-porous clays.

When concrete is used as a foundation, cushions are laid of sand, sand-cement, mastic (sand and bitumen together), or asphalt preparation. Brick is the most common block pavement today, though it is giving place to concrete. It was first tried at Charleston, West Virginia, in 1872, next at Champaign, Illinois, after which it became tremendously popular for both town and country roads. It is of various sizes, shapes, and compositions, and on straight-ways is laid perpendicular to the direction of traffic, or at any convenient angle on curves or at intersections. Fillers for brick pavements consist of sand, bitumen, asphalt, mastic, or grout (sand, portland cement, and water). Rubber blocks are being tried on bridges like the Michigan Avenue Link in Chicago; durex cubes of granite, other stones, concrete, asphalt, and even other materials are now used for certain purposes.

Concrete. Because of its strength, lasting qualities, and small cost of upkeep, concrete seems destined to become the favorite paving for streets and roads. Much of the new trunk-highway construction is now in concrete. This is single or double course. The single, the more common type, is one slab resting on a carefully prepared stone foundation. Double course concrete has a first layer or course resting on the foundation and this is later topped with a second of finer, better mixture. Concrete is a standard product made in rather definite proportions of material. The formula is 1 part of cement to 1¼ of sand to 2½ of gravel, in one extreme; or 1: 2½: 4, in the other extreme. Mixing must be thorough and careful, so that the texture may be uniform. On jobs of any importance, machines now do this most efficiently. To save cracking of the slabs of concrete, joints of felt, wood, or tar are placed at regular intervals cross-wise; and recently lengthwise also to mark the division between two tracks or halves of the pavement. Sometimes at corners, near other material, or where traffic is most heavy, certain reenforcements are used.

Costs of roads. Recent statistics indicate that the average costs per mile in the United States are as follows: About $35,000 for the highest type of roads (including concrete, brick, bituminous concrete, macadam or other permanent paving); $17,000 for medium type (including treated gravel, low grade macadam, etc.); and $8,600 for the low type (including gravel, sand-clay, or earth). Massachusetts led with $60,000 a mile for high type and $20,000 for low type; Mississippi was lowest with $23,000 and $4,000 respectively. Revenues are varied and hard to separate from the totals, yet in one year over a billion and a quarter is spent on roads. This is equal, however, only to about half the tire and fuel bill of automobiles. Money is derived from taxes on automobiles by states and towns, gasoline taxes (over 800 millions a year), federal aid funds, direct taxes, floating of bonds, and other incidentals.

Nearly 100,000 miles of road yearly are improved in some manner other than by mere upkeep, over one-third being new surfacing. Legislation provides for Federal aid to road building equal to 50% of the cost not to exceed in all $10,000 a mile from the government, with fully 100% in certain definite instances, especially in states where public land lies. Thus we have nearly 100,000 miles of improved road in the Federal-aid highways, half the total so designated; and the state highway mileage is 200,000 of improved roads in addition, and, finally, over 2,700,000 of county and local roads not improved by either Federal-state or state money.

ROPES. This article will include ropes made of fiber, animal products, and metals. Cordage is rope made of yarns, twines, and cables, including only those of at least one-half inch in diameter. Common twine, smaller than rope, is made by laying or twisting strands together; large rope is often made by a process quite similar.

Early history of rope. Early man did not have fiber ropes, but used leather, barks, hair, and other materials. Yet the American aborigines used yucca, agave, and native vegetable fibers for rope. Egyptians used papyrus for rope and paper, with hides, and palm fibers. Greeks and Romans had enormous cables of rope material. Little progress, however, was made until modern machinery replaced hand-made ropes after 1820. Material was combed with wires, laid lengthwise, and bound by hand or by a crude wheel into stranded products. In colonial days and after, many communities had walks made of rope.

Modern materials and methods. Hemp from Russia, Italy, and the United States, and flax from many lands, were the chief materials till after 1900, and the former is now used extensively for marine ropes and fittings. Manila fiber (the real name is abaca) comes from the Philippines as the most suitable material for strong rope cables today. Henequen, a Mexican and Cuban product, resembling the real sisal of Asia and Africa, jute, and cotton are other important fibers, but the latter is used mainly for braided cords and small ropes. Whatever process is used in making ropes, the operation consists of five parts: selecting the fiber, preparing the sliver (bundles of fiber laid lengthwise), spinning the yarn, forming the strands, and laying the strands in cables. Making the sliver consists of several acts of combing the threads, cleaning them, and treating them with steel pins in sets. The result is a heavy stream or mass, the sliver, fed into a machine which compacts the whole, next into the machine which twists the threads or yarn, the different ones being twisted in opposite directions alternately; and so any tendency of either set to unravel is balanced; finally, the three or more large strands are woven together and laid on a drum or wound into piles.

Uses of ropes. Besides many different uses for cables, bridges, anchors, supports, and pulleys, ropes are used for transmission of power instead of leather or cloth belts or other means. This means was adopted first by James Combe of Belfast, Ireland, in 1856, and the rope is arranged singly or in several strands, going in the latter instance to different parts of a mill. A large percentage of rope goes into the marine industries, much of it into drilling wells of varied types, and smaller sizes into the farm and home activities. Bending over sharp machinery or pulleys harms rope, or exposing it to acids, dampness, or sudden changes in climate.

Wire rope has many interesting features and uses. Before 1870 wire strands were used in collieries and for hauling generally, but since then numerous uses have developed. Wire rope is superseding fiber in some marine uses, cranes, derricks, air or power cables, telephone wires, and for supporting bridges. In some cases 400 single wires go to make up one cable. Smaller types in great demand include 6 strands of 7 wires each; hauling rope of 6 strands containing 9 wires made over a core of 7 smaller wires; flexible steel hausers made of 6 strands of 12 wires each, the whole wound around a core of hemp; and copper, aluminum, or alloy strands separated by some non-conducting material like vulcanized bitumen and bound in large bundles or cables. Such wire ropes are made by a process somewhat similar to that in making fiber ropes.

RUBBER. Since 1900 no product has gained more in importance than rubber. Though it was known centuries ago,

little was made of it until after 1800. Erasers and waterproof cloth were introduced before 1825, but the rubber melted when it became hot. Charles Goodyear (q. v.) in 1842 discovered that sulphur when heated with rubber made the combined product stable and easily handled. With the advent of the soft tire for vehicles, extended uses in the electric industry, in making various products, rubber became of world importance. Supplies now come from South and Central America, mainly from Brazil, from Ceylon and other South Asia points, Africa, and other places in the tropics. It can grow farther north, probably even in the United States, and certainly in the Philippines. In 1870 we imported 5,000 tons, in 1911 only 72,000 but in recent years, an average of about 500,000 long tons. This indicates the gain of rubber commercially.

Nature and production. Many trees exude juices which become resilient when hardened. Chemically the name is caoutchouc; industrially the modified form is rubber; originally the fluid is latex. The juices are brought out by scoring or tapping the trees, at the bases of which the fluid collects in a cup or other container. Different species of shrubs and trees yield the latex, the finest being the Para from Brazil; Asiatic rubbers differ from those of South America. All rubbers are hydrocarbons, having complicated structures, and varying in resinous content, the chief value of rubber. *Guayle* rubber contains about 20% of resins, but *hevea* has only less than 3%. Commercially the fact that rubber may be vulcanized with sulphur gives it chief value. Physical properties of rubber are these: pale color, great stretching, highly adhesive, pliable, not easily affected by water or gases, easily combined with minerals. Best rubber will absorb by vulcanizing at least 33% of sulphur. *Para* rubber reaches the market in form of masses called hams because of size and peculiar odor due to smoking, and it loses in weight nearly 20% on washing and cleaning. Some African rubbers, however, lose 50% in bulk during refining operations. The United States takes about two-thirds of the total world output. Market values of rubber are determined relatively by tackiness, tensile strength, age, softness, cleanness, acidity, and skill in smoking. Great acreages of rubber have been planted in late years, which promise adequate supplies, barring unforeseen contingencies.

Preparing rubber. First, washing is accomplished by passing the crude rubber through rolls under sprays of water. Drying, which is extremely important, is done by natural methods or by a vacuum mechanical process, the latter having superseded the drying, though that is said to excel in making pure rubber goods, elastic bands, and threads. Drying in a kiln promises more uniform results when it is fully developed, for when humid air is introduced the rubber dries first internally and then on the surface, making a better product. Next the rubber is broken down by being run through warm rollers, after which it is mixed into a dough or batch. The batch is passed between three or more sets of rollers and made into sheets of the same thickness. Vulcanizing or mixing with sulphur is accomplished in varied ways according to the product to be made from the rubber. Thus tires, hose, belting, toy balloons, overshoes are all differently treated. Steam, dry heat, pressing, cold, and vacuum cures are the chief methods employed in vulcanizing.

Rubber products. Little unvulcanized rubber is employed. In the form of rubber cement or adhesives it is quite familiar in electrical insulating tape, surgeon's tape, and in the newer crepe-soled footwear. Because it resists wear, it is useful for tires, heels, conveyors and belts in factories, and in lining machines where abrasion must be avoided. Because of its resiliency, it is used for tires, hoses of many sorts, machine rolls, including those for wringers, joints, valve disks, elastic webbing, and various types of shock absorbers. Its ability to resist diffusion of gases makes it adaptable for couplings, balloons, bladders for footballs, rings for jars, gas masks, tennis balls, and many others. Because it does not hold so well when wet, it is sometimes used for bearings in pumps and in propeller shaftings. Because it is waterproof, it finds hundreds of uses in caps, coats, gloves, footwear, bathing caps, and dams used by dentists. Because of its electrical resistance it is employed in scores of insulations, gloves for handling live wires, and protective coverings.

Sheet rubber is much used for tobacco pouches, hot-water bottles, elastic stockings, and the like. Elastic or *rubber thread* is used for braces or suspenders, garters, and products where a small tensile cord is needed.

Other rubber and near rubber products. When rubber is specially vulcanized for a long time (6 hours instead of 2 or 3), with excess of sulphur, ebonite, and vulcanite are produced, a hard but yielding substance which resists chemical action, and so it is much used for laboratory containers. *Chicle*, the chief component of chewing gum, is a latex much like rubber proper, and like rubber exudes as a pale milky sap from trees in Central America. It is elastic, aromatic, and tenacious. *Gutta-percha*, another resinous latex from trees in the East Indies, has been in great vogue for insulating submarine cables, for temporary fillings by dentists, as the core or center of golf balls, and in certain types of dress shields. Laid between thin layers of fabric it has also been used as mending tissue by tailors. *Balta* is a substitute for gutta-percha, especially in dress shields.

Imitations of rubber. High cost of rubber at times has led men to experiment with substitutes. Some of these include products made of linseed, rape seed, or castor oil combined with sulphur; or gelatinous substances and some acid. *Shellastic* is now made of oyster shells, chemicals, and oils. This and other substances have the properties of rubber, but are not synthetic products. Some chemists say, however, that man may find another artificial substance that will outdo rubber itself. After many years of experimenting, chemists have discovered the true nature of rubber. As early as 1879 a Frenchman claimed to have changed isoprene to rubber by use of hydrochloric acid. Synthetic rubber has been described as "isoprene polymerized to a rubber-like substance." Thus far processes attempted by a dozen firms in different lands have proved that synthetic rubber may be made, but it is too costly to compete as yet with the natural products, which in bulk are constantly increasing.

SAFES. Small movable metal containers with doors rather than lids are called safes; large rooms of similar type are called vaults; and boxes are called coffers, safety-deposit boxes, and other names. Since 1888 solid safes, with rounded corners, cast in a single piece, except the doors, have proved valuable against fire and burglary. Previous to 1800 many artistic containers were used, but none were fireproof. In England though several patents had been secured, the earliest real safes date from about 1846, made by Thomas Milner of Liverpool. Various devices were adopted to prevent burglarizing: Double thicknesses, filled with resistant material, slanting doors that could not be jimmied or opened by bars; and hard plate steel of high carbon content not easily drilled. Modern safes refine these measures.

To resist boring, blasting, melting, or other operations, safes must be made of high-proof steel; to resist slow charring, the fireproof interiors must be ample, the walls of sufficient thickness, so that the safe may be buried under hot metal for hours or days without great harm except to looks; and to make it proof against falls of floors, the safe must be very solid and non-cracking. The oxy-acetylene blow-torch must be resisted, or the blow-pipe mode of attack by burglars; locks must be in combination of two or more, so that, should one fail, the others will delay entry, and the timing arrangements must be encased so that they cannot readily be destroyed. Time clocks of two, three, or even half a dozen chronometers are now employed. Modern safes have burglar alarm attachments or secret methods of resisting attack. By all means the most effective alloy yet discovered is a recent patent in which copper is used. This metal resists heat, explosives, drilling, and blasting. It would take burglars hours to penetrate with the strongest torches a safe made of 20 inch metal, including 12 inches of copper.

SALT. Sodium chloride or common salt has been known by all tribes and nations, for it is common throughout the world. It occurs in all waters, notably in the sea, in natural brines of certain lakes or pools, and in the mineral form called halite, or rock salt. Sea water averages about 3% more for inland seas like the Mediterranean and in tropical waters than elsewhere; the Dead Sea of Palestine has about 10%, and the Salt Lake in Utah nearly as much. The River Jordan, it is estimated, washes down 850,000 tons of salt yearly into the Dead Sea. Natural salt brines are most common in Austria, France, Germany, India, and in the United States chiefly in Michigan, New York, West Virginia, Ohio, and Pennsylvania. Some natural brines of England, obtained at great depth by boring, contain chlorides of barium and strontium, interesting variations from normal brines; and in America in West Virginia and Ohio certain other substances are present in salt brine from wells. Rock salt or halite, in paying quantities, is mined in Louisiana, Kansas, Colorado, Nevada, Oklahoma, Texas, and New Mexico, and in some degree elsewhere; abroad it is found in the Punjab of India, Saxony, Tyrol, near Cracow of Poland, and in England. Gypsum, carnallite, sylvine, and other minerals occur with rock salt at some points, and the theory is that these all result from the drying up of prehistoric salt lakes.

Preparing salt. The Louisiana mines have shafts, galleries, and elaborate blasting like that of coal mines. In Colorado rock salt at one spot forms a crust over a lake of brine, and the surface is cut into cakes as ice is sawed. In New York the rock salt is dissolved by forcing water down through pipes and pumping the solution out in others. All salt must be evaporated, dried, and refined. Rock salt is broken up by rollers. California and Utah especially carry on the process of drying the brine in pans or wooden troughs as once in New York and Michigan. Artificial heat is now applied in many plants to long, shallow pans, the salt rises to the surface, is fished out, whizzed in containers and so dried. The vacuum method is not possible, since unpleasant results follow. New methods are now being sought. Rock salt of good quality, as in the United States, is broken up, dried, and put upon the market without further

treatment. In England various purifying agents are used.

Salt in commerce. Various kinds of salt in the home and food plant are well known. Common table salt is of highest purity; it is sometimes treated with enough sodium carbonate or other product to keep it from getting damp and sticky. Coarser varieties are used in manufacturing and the arts. Salt used in curing fish is still coarser and often contains other minerals. Bay salt, the coarsest of all types, is used largely in refrigerating processes. Meat packers use huge quantities of various salts. As an intermediate salt is used extensively in the making of sodium carbonate, the common washing soda, sometimes known as sal soda, caustic soda (sodium hydrate), often made by electrolysis, much used in making artificial silk, in hard soaps, and in mercerizing textiles, in making hydrochloric acid, chlorine, bleaching powder, glass, as a glazing agent, and in tanning, refrigerating, chlorinating, pottery, and metallurgy. So one sees the common, humble salt of everyday use pass out into a multitude of forms and products.

SEWING MACHINES. Various inventions from time to time have brought the sewing machine to a high state of efficiency. Some important steps are these: double-pointed needle by C. F. Weisenthal (1755); other essential features except eye-pointed needle by Thomas Saint of England (1790); B. Thimmonier, a Frenchman, made eighty or more machines that worked (1830), but he died unrecognized in 1857.

American invention began with Walter Hunt (about 1833), who devised an eye-pointed needle and double-thread machine, but failed to win a patent. Elias Howe (1846) patented the lock-stitch, his machine having also Hunt's main ideas, arrived at independently; and Howe unsuccessfully tried to introduce the machine into England, finally allowing his rights to pass out of his hands, but later by complicated litigation winning them back, after Isaac M. Singer (1851) had patented a machine. Alan B. Wilson (1849) invented the rotary hook and bobbin devices, and a new type of feed for moving the cloth along; his machine gave rise to the modern Wheeler and Wilson make. William O. Grover of Boston (1851) patented the double chain-stitch action; James A. E. Gibbs of Virginia (1856) made the machine, which, as improved by J. Willcox, is known as the Willcox and Gibbs. All modern machines are improvements or variations in some slight degree from these early types. The same principles have been applied to heavy machines for sewing carpets, leather in shoes, and various kinds of cloths.

Over 1,500 varieties of machines have been used. Some special forms are those for sewing bottoms on shoes, leather into felt hats, sewing silk initials on cloth in one operation, and machines in multiple units for making parallel rows of sewing. They are fitted with special treads, motors, electric lights, and special devices.

SHOES. Footwear has gone through an interesting evolution from the sandal to the fashionable lady's boot today. Sandals of grass, bark, or other natural substance, bound on the foot with a thong, willow, or similar tie, are still worn by many primitive and desert folks. Indians developed a foot-covering from skins, no thick soles being used. Modern shoes are sandals and uppers combined in one. Boots extend to the knee or nearly so, but rather high shoes are sometimes so designated. Wooden shoes are much used in Holland and other north European lands; and clogs or pattens have wood soles fitted to leather uppers.

Cobblers were once highly important and respected craftsmen, their art being designated as the gentle craft, and their shops being centers of intellectual, religious, and literary gatherings. From St. Crispin, patron of shoemakers, to Henry Wilson, eighteenth vice-president of the United States, shoemakers often became famous. In 1629 Thomas Baard set up his shop at Salem, Massachusetts; Henry Elwell at Scituate in 1634; and Philip Kertland at Lynn in 1635. Many early towns gave shoemakers special grants of land; farmers welcomed them and prepared leather for uses at home. Itinerant shoemakers were quite familiar till after 1860. Their tools consisted of a lap-stone, hammer, assortment of nails, several awls, and thread, for the patrons usually supplied the leather. When Salem and Boston became ports of note, Lynn turned to shoes,—for a century headquarters of the best makes. Gradually New England became almost one single shoe factory. Home sewing of parts grew up, and even sailors made shoes while on long voyages. By 1761 exports of shoes to Nova Scotia alone amounted to 13,000 pairs a year. Until after 1783 the price was about a dollar a pair. Danvers specialized in cheap brogans; after 1860 Brockton vied with Lynn for finer types.

New York, New Jersey, and Philadelphia took up the trade, as many other communities did later, but New England supplied most of the cheap shoes for home use and exportation to the West Indies and South America. Lefts and rights, definite gradation of sizes, and quantity production were Yankee ideas. Hand labor continued till after 1800, though machines had entered the cotton and other industries by 1750. Meanwhile from 1600 or before, machine-made wooden pegs had been used for shoe heels, but not until 1815 was a machine invented to make pegs for soles. Samuel Preston (1833) made a mechanical pegger; before 1860 Howe's invention was adapted to sewing shoes; Lyman R. Blake (1858) perfected the machine to bind soles to uppers, which was developed by Gordon McKay of Pittsfield, Massachusetts; Jan E. Matzeliger invented a machine laster; and finally Charles Goodyear perfected a mechanical way to turn out welt soles (1871). Between 1850 and 1900 more than 4,000 patents were granted for shoe working machinery alone. Factories sprang up in the middle and western states, each one tending to make a particular style or kind of shoe. Large corporations developed, and yet the small shop at certain points held its own fairly well.

Shoemaking is largely team work,—uppers, liners, facing and tongues, backstays, top pieces, and the vampers attaching the top to the vamp. Then the lasting machine attaches the insole and last, and the shoe goes to the stitching machine. The welter stitches the insole and upper to the welt; the bottom of the shoe is covered with cement; the outer sole is pressed and the edges cut to the shape of the shoe in the trimming machine, which also cuts a groove so the stitching may be hidden, and another sewing machine with curved needles stitches the soles to the welt. The new "double clinch" machine drives a wire through the inner and outer soles, clinches it, making and closing the stitch channel. This process gives great flexibility. Machinery levels the sole, the heeling machine feeds leather and just so many nails, and a single blow drives them into place. Minor smoothing and finishing complete the shoe.

Recent developments. Styles in shoes, expressly in women's footwear, perpetuate many small concerns, though large uniform scale production seems to be gaining. Style changes relate to colors, leather combinations, shapes, and decorative effects. Maine and New Hampshire have attracted many mills from Lynn, Haverill, and other towns. St. Louis and Brockton now lead in output, with Milwaukee, Chicago, and Cincinnati rapidly increasing centers. New York City supplies its tremendous local trade with over 250 separate factories. Milwaukee has outdistanced Lynn, and is now only just below Brockton, St. Louis, Haverill, and New York. The largest shoe company, resulting from mergers, now makes nearly 200,000 pairs daily when business is brisk; the next largest turns out over 125,000 a day, each of these also making about that number of pairs of rubber heels.

SILK. Until about 550 A. D. China was the only home of the silk-worm, where the industry of making silk was jealously guarded. One empress as early as 2640 B. C. developed the culture and is credited with having invented the primitive loom. After 300 A. D. the secret got to Korea, thence to Japan, and finally by two monks was carried to southern Europe. In Mediterranean lands it has flourished since then, and it was introduced into Europe in the reign of Henry VI. Today the total world production is about 100 million pounds, nearly two-thirds being exported. Japan leads with about 25 millions, China with over 8, Italy a little more than half that, France, Spain, and Indo-China furnishing the rest so far as exporting is concerned. Recently the handloom has commenced to give way to the mechanical, the number in Europe being now about 20,000 compared with 150,000 formerly. The United States now has over 85,000 or nearly 35% of the power looms of the world. Chief centers of the trade in finished silks are Lyons for France, Krefeld for Germany, Genoa for Italy, Zurich for Switzerland, and Macclesfield for England. China of late has developed a great export trade in silks because power looms have become rather numerous there.

Production of raw silk. Several species of moths or caterpillars yield silk fiber, the chief moth being one that feeds on mulberries (the *Bombyx mori*). In warm countries these grow more or less continuously, but in Europe they reproduce but once a year. Tussak silkworms are those which grow wild. The worms have two glands running lengthwise of the body, from which thin viscous liquid exudes, and this hardens almost at once into a fiber, which is the most elastic and most durable of all textile fibers. Compared with steel wire of the same size, the silk filament is much stronger. This thread forms the cocoons of the worm, and these are used in spinning silk thread.

Eggs of the *silk worm* (in the trade called "silk-seed"), are about the size of a pin head. They are hatched artificially by warming, usually now by incubators in Europe, but under primitive, natural conditions in Asia. Finely chopped mulberry leaves are the food, placed on shelves conveniently arranged about a room. Nothing grows faster than a silk worm. In a few days he can consume a whole leaf, the feeding period lasting about 40 days in all, but meanwhile the worm passes through four sleep periods of about a day each. Each time the worm emerges with a new skin. After about the 27th day, he begins a new feeding period of 10 days or more, during which he eats twenty times his weight of leaves, which must be fresh and only a little wilted, for a worm will not touch dried leaves. At hatching the worm weighs but one-hundredth of a grain, and is about one-twelfth of an inch long; at maturity he weighs ten grains and may be three inches long.

Now he is ready to spin his house or *cocoon*. Oak, bamboo, or other wood branches are introduced; the worms mount

up into them; and at once begin to exude the glutinous fiber. In exactly eight days the cocoons are picked by hand,—it being most important that all worms of a batch develop exactly in unison, so that all cocoons may be ready at the same time. Next, the *chrysalis* (or worm about to become a moth or butterfly) must be killed without injuring the silk fiber, or without disarranging the threads. Methods of killing are by exposure to sunlight, by steam, or by hot air,—the last now being preferred. For about six weeks the cocoons now lie on frames, but they must be turned over twice each day to prevent heating, while the dead chrysalis gradually dries up. Some of the chrysalids are allowed to mature into butterflies, which lay eggs for the next crop. The life cycle from egg to finished cocoon is about 60 days. One female moth lays about 300 to 400 eggs, and 100 will produce enough to weigh a single ounce. In cooler climates between seasons the eggs are now often kept in cold storage; in Asia they develop continually under natural, warm conditions, going through several cycles a year.

In Africa in late years "wild" silk from the spinnings of the Anaphe worm has gained considerable notice. The worms make communal houses of great size, covering them over with a substance as hard and tough as parchment. This outer fabric seems to promise interesting developments.

Making spun silk. Perfect cocoons must be selected, only those free from injury, foreign substance, holes, or other features that break or deteriorate the threads. By hand sorting they are divided into five grades. Since a single fiber is not strong enough, six or more have to be twisted or rolled together. Masses of the cocoons are placed in warm or hot water, to make the surface of the fibrous threads viscous. They are twisted when they come out, and the resulting threads are wound over steel or other drums. The object is to make a strong cable of several fibers. The Chinese in most cases do not kill the chrysalis in the cocoon but wind the silk before the worm develops into a moth. Silk produced in this way is unexcelled, however, for luster and strength. Some waste collects from the cocoons in the reeling operation, and this is used for grades of fabrics.

Silk threads are classified according to weights, the unit being called a dernier, or the weight of a thread 450 meters long. Different threads weigh according to size and texture. A dernier is .05 of a gram in weight. Taffeta, for example, 13 to 15 derniers for every 450 meters of length; georgette, from 16 to 20; and so on for the different kinds.

Throwing of silk is twisting the strands into yarn. This is made by twisting the threads together, a much simpler process in silk making than in making cotton or other yarn where the fibers are irregular in size and length.

Thrown silk is of three classes,—singles, tram, and organize. *Singles* are raw silk threads, twisted or not, and they are used for warp of chiffon and like fabrics of very fine texture. About one-fourth of silks of American manufacture is of this type. *Tram* is two or more raw threads twisted about two to four times for each inch of thread, a slack type used for filling in cloth. The processes of throwing tram include soaking of the fiber, winding, doubling, spinning, and reeling. *Organize*, which is used mainly as a warp, consists of doubling two or more threads already twisted, and then again twisting them in the opposite direction at least eight or ten turns to the inch. The processes are soaking, winding, spinning, doubling, spinning the second time, and reeling.

Silk cloths. Making of cloth fabrics from silk resembles that of other fibers. Thrown silk is wound on spools or bobbins, tram being put on shuttle bobbins called quills, and organize being made into warps. Iridescent silks are made by alternating wefts and warps of different tints or hues. Silks are commonly dyed in the yarn. Finishing is accomplished by many varied processes, among which are singeing in gas flame to get rid of loose fibers, over steam cylinders to straighten them, and in starch or other solutions to stiffen them. They are ironed, stretched, pressed, "watered," embossed, and otherwise treated. Though over two hundred ways to waterproof silks have been patented, few of them are anything like a success without injuring the fabric in some manner. Waving or watering (technically called moire) is done by engraving rollers under high pressure, so that light is reflected differently at various angles. Embossed silks are made by running them through rolls with designs engraved on them at corresponding points, a process used for both thin goods and velvets. Ribbons of varied kinds are made on special looms. These and thread for years were the chief silk products of the United States. Floss silk consists of singles very lightly twisted, while embroidery silk is a group of singles, doubled, and again twisted lightly in reverse direction. Machine twist is three-ply, while ordinary thread is two-ply, and "sewing silk" is two threads twisted from left to right. For artificial silks, see article on *Cellulose*.

Some silk fabrics. Scores of names have been used to describe the texture, color, weight, or process of making silk fabrics. Some of the chief silk cloths will be described to illustrate. *Baronet* satin is high-luster, artificial silk and cotton, summer wear goods. *Bandanna* (from Hindustani word meaning to tie) is made by dyeing cloth blue, red, yellow or some other color, leaving certain spots white by binding them off before dipping in the dyes. *Bombazine* has warp of silk and weft of worsted. *Brilliante* is light, sheer, brilliant, raw-silk fabric. *Brocade* has raised patterns or figures. *Chenille* is a fluffy surfaced cloth made of silk yarn, with warp of worsted or cotton. *Chiffon* is made of very fine threads,—8 miles of thread to the pound. *Crêpe* is thin, loose, sized or gummed heavily, and crimped or crêped in dyeing. *Foulard* is often made of twill, with small designs. *Habutae* is a celebrated japanese pure silk in plain, close weave, usually dyed or printed in the piece. *Pongee* is a fine, unbleached, washable silk made by the wild worm which feeds on oak leaves. *Poplin* has silk warp and filling of wool heavier than the silk, which gives the fabric a corded effect. *Satin* is a special weave with the filler binding the warp as seldom as possible, a fact which leaves the surface very smooth. *Taffeta*, old type of skein-dyed silk of plain weave, with cross-ribbed appearance. *Terry* cloth has face or both sides made with loops like turkish toweling. *Velour* resembles velvet, having a coarse, stiff pile, somewhat like plush; once made of linen, it is now also made of jute, cotton, or worsted. *Velvet* is all silk, silk face, or even all cotton, the best quality being wholly of silk. It has a short, thick smooth pile, with plain backing. *Voile* is made of well twisted yarn of light weight, with a plain weave, and dyed in the piece.

SOAPS. For convenience we include also soap powders, metallic soaps not soluble in water, and glycerine, an interesting product from soap-manufacture. Most soaps are chemical compounds of fats and fatty oils with alkalis. Progress has been slow until recent years. Man first evidently used goat's tallow and beach ashes, then potash derived from plants, kelp, and barilla from 1200 down to nearly 1800, after which the Leblanc process of making soda from brine gave rise to new methods of utilizing soda for soaps.

Nature and Methods. How soap cleans is not fully explained, but it seems to be due to the soap part, and not to the alkali, for the mixture in water loosens the dirt, then seems to act as a lubricant to prevent it from adhering again to fabric or skin. Soaps are either hard or soft, but usage prompts many other classifications. Nearly all fats may be used; such, for example, as tallow and grease for many toilet soaps; vegetable oils like coconut and cottonseed for marine soaps; olive for common textile and toilet makes; and palm and castor for transparent soaps. Linseed oil, soya bean, and resin are used in washing soaps, with tallow and bone fat in the cheaper brown kinds. For the alkalis caustic soda, potash, and sodium carbonate are commonly employed.

Manufacture is rather complicated, and methods vary for different types, the main ones being the boiled, semi-boiled, or cold process soaps. Let us take the making of *boiled process soaps* to illustrate: Melted fat, oil, and a small amount of 18° caustic soda lye are run into a vat by three different spouts, the lye being added after the others are heated by steam. Next is the graining process,—removal of about 10% of bulk of glycerine in free state; this is done by putting in salt until the mass is a curd from which lye flows freely. When the steam is at last shut off the soap rises to the top of the kettle; the lye and glycerine residues, if any, sink. The soap is again boiled, with a dash of added caustic soda until proper alkalinity is attained. Now water is added, and the soap should be "flattened," that is, look smooth. Additional processes include settling for a few days (during which impurities settle toward the bottom), mixing for "crutching" in a machine; pouring into molds or "framing," and cutting into sizes. After further drying the cakes are pressed and then wrapped, when all trace of surface moisture has been obliterated.

In the *semi-boiled process* the soap is hydrated, treated by boiling, and then cooling and pressing. In this method nothing is removed from the kettles, and so the original ingredients must be of exceptional purity. The Twitchell process now seeks to remove the glycerine from the fats before it reaches the soap kettle. The *cold process* is simplest of the three, being adapted to coconut oil materials, which saponify easily when mixed with lye. Cheaper toilet and transparent soaps are made in this manner. The mass is simply melted, stirred or crutched, and finally poured into molds to cool. Tallow soaps need some agent to make them lather quickly, and oil is used in toilet soaps, resin in common laundry soaps.

Special kinds of soaps. Soft soaps are made with potash and an oil rich in oleic acid, linseed oil, red oil, cottonseed oil being the chief selections. *Liquid soaps* differ from soft in that coconut oil is often used, the lye is well settled, and either glycerine or alcohol is added to keep the product from hardening. *Floating soaps* are made like others, except that the stirring or crutching is done at great speed, so that minute air bubbles enter. This type is never pressed or milled, but cooled directly in the frames or containers. *Castile soap* consists of olive plus some other oil mixed with the ordinary soda lye by the cold or semi-boiled process Difference in color is due to the use of white or green oils. *Mottled soaps* are colored with some iron sulphate, ultramarine, black, or other pigment material. *Transparent soaps* are made of soda mixed with alcohol, the excess spirit being removed along with any impurities or solids, leaving a

transparent jelly. The cold process requires more glycerine with the alcohol. *Shaving soaps* are usually made of the highest grade stocks of coconut oil, soda, or potash, stearic acid to give a body, and some gum to keep the lather from quickly drying. The *shaving cream* contains coconut oil, potash and stearic acid. *Soap powders* are good soaps pulverized, and toilet powders usually contain talc, calcium or other stearates, and often some antiseptic like boric acid, *Medicated soaps* contain healing, antiseptic or other solutions, such as the creosol product called lysol. Phenol or carbolic acid, borax, thymol, mercury salts, and for skin troubles zinc, copper, mercury, and lead soaps are much in demand. *Metallic soaps* made of alkaline earths and metals are used in the arts. So lime soaps are components in many lubricating greases, aluminum oleate is used as a paint thickener and for waterproofing textiles and paper, and some other oleates are used for driers in varnish and paints.

Glycerine. This valuable product used in making explosives, skin lotions, some medicines, and in the arts is exclusively a by-product of soap making. The supply, therefore, depends on the amount of soap manufactured. When the fat is saponified by the caustic soda, the resulting soap is separated when salt is added, leaving a liquor which contains glycerine. Fats contain about 10% for tallows, and 13% for coconut oils. Glycerine is produced in sugar fermentation, but no way has been devised to conserve it. The United States, therefore, imports great quantities of glycerine, the world output being about 850,000 gallons yearly, about 60,000 tons.

STARCHES. Along with sugar, gums, and cellulose, starch belongs to the carbohydrate group, since it is composed of the elements carbon, hydrogen, and oxygen. Yet it is a very complex substance, existing mainly in granules of varying sizes, the various starches each having a distinct character. Pure starch is white, glistening, tasteless, not soluble in cold water, and constant when exposed to air. In hot water starch forms a viscous, jelly-like starch paste, as it is named. When heated in acids and subjected to hydrolysis, it changes into sugars, mainly dextrin, maltose, and glucose. In a solution with iodine, starch turns bluish, a very valuable identification characteristic.

Manufacture. Many plants contain enough starch for collection commercially. Those high in starch content include in order rice, maize or Indian corn, wheat, millet, lentils like peas and beans, rye, oats, arrowroot, and potato. Those persons seeking to "reduce" should notice that potato contains the least and rice the greatest of fat-forming starches. Starch is often made from roots and tubers in the country where these grow. Maize and wheat are largely used in North America, England, France, and Germany; corn in the United States; arrowroot, cassava, and tapioca from plants grown in the West Indies and South America; sago from the East Indies and Borneo; and potato mainly in Europe. Manufacture of starches consists of breaking of cell walls containing plant cells, from which the starch content is separated by shaking or beating. The details include washing, pulping, collection of the starch liquor in vats, filtering by gravitation or by hydro extractors, and drying the cake or mass resulting.

Uses. Starches are used in commerce, in making food, and in laundering. They are employed extensively to size cloth, yarn, in thickening colors for printing, painting, and dyeing, in making various types of edible syrups, and for sugars in fermentation. Besides extensive uses as food in breakfast preparations, flours of all kinds, and similar products, starch in powder form is used to make "cornstarch" pudding, blanc mange powders, macaroni, cocoa, and in certain types of confectionery. What we call tapioca is made from moist starch from the manioc roots, dried in small granules, or clusters, and then run through rollers and graders. Pearl sago for food is made from drying starch in plastic dough form, by which the granules are collected, and then dried in the air. Various corn syrups are starch changed chemically into sugar, and then into liquid form. Laundry starch in powder or crystal forms, mostly from corn or rice, is made from blocks that result from the drying process and filtering; then completely dried in lump form.

SUBMARINES. The normal type of under-water craft is submerged when certain "ballast tanks" aboard her are filled with water. Submarines are single or double hull, the latter being costly and used now largely in big ships alone. Hulls are either circular, semi-elliptical, or elliptical, with ballast tanks between the two hulls in some cases or at the bottom and partly at the sides. Each tank has a water inlet at the bottom, and air outlet at the top, and also an intake for compressed air, which, by forcing out the water, causes the boat to rise to the surface. Spaces for the crew, fuel, torpedo room, engine room, oil room, batteries, and stores make up the rest of the main part, the rooms now being specially fitted with bulkheads and made water tight, a safety feature in case of accident. The super-structure contains a conning tower, above which protrudes a periscope, the only part of the boat visible to an enemy, when the craft is not far under water. In times of emergency, the submarine must be in "ballast trim," or instantly able to submerge by beginning to fill the tanks with water. Compensating tanks, besides the main ballast ones, are provided, for instant use, in case pressure is added or released anywhere in the craft; and these must be constantly watched. As fuel oil is burned, the containing tanks are filled with sea-water from the bottom, and difference in gravity is compensated. This is true of all items on the ship, a tank being provided for each, as for food, fresh water, ammunition, one or more torpedoes. Mine-laying boats have special tanks to compensate for the release of the mines.

Important accessories. Compressed air used in blowing out the water from the ballast or submerging tanks must be stored in bottles or other containers under tremendous pressure,—sometimes as high as 2,500 pounds a square inch. These are recharged by compressors when the boat is riding on the surface. The pumping system has at least two good units, capable of pumping against any pressure of water to which the submarine may be subjected. Each boat has a rudder and two hydroplanes at either end, the object being to keep the craft stable at all times. Recent types of periscopes consist of long tubes, some of them 35 feet high, fitted with a glass window and a prism at the top, and various lenses within the tube so that as clear and as wide a view as possible may be carried to the observer's eyepiece. The original field of about 15 degrees may be increased by moving the periscope by means of two handles. Submarines are now fitted with special Diesel engines and also with electric motors, the latter being used to drive the twin propellers when the craft is submerged. Displacement is now from 1,000 tons upward to 3,000, and the surface speed is about 17 to 20 knots an hour, this being cut one-third at least under water. Batteries of the lead-plate type supply power for propelling, and running rudder and hydroplanes. These batteries must be recharged at the surface of the water, but they last for 30 hours under water at 2 or 3 knots speed. The armament consists now of as many as six torpedo tubes of 21 inch type, the largest conveniently handled by a man. They are discharged by air-pressure.

SUGAR. Technically the name applies to more than 100 different substances of varying natures and names, the chief ones being sucrose, glucose, lactose, and maltose. Sucrose is the common variety, including cane, beet, and maple sugars, and those made from corn, sorghum, and palm. These when refined are colorless, odorless, and the same in sweetening power.

Cane sugar. This product of the sugar cane grass or stalk is produced in tropical and in some sub-tropical lands, the chief centers being Cuba, both coasts of Central and South America, India, Egypt, and the eastern coast of Australia. The canes grow at least 12 feet high, mature in about 13 months, and the stem is hard within and soft at the very surface. They are cut at the ground, leafed, and sent to the factory, or sometimes as in Louisiana, stored for some time in the fields. The root again sends out stalks for a new crop. Recent culture has produced improved varieties.

Making sugar is an elaborate process. The stalks are ground or shredded by machinery, and water is added to the resulting mass now called bagasse. Several millings are usually necessary to get all the sugar content. In the dry process no water is added up to this point. Next follows several purifications, first straining through brass containers with 400-500 holes to the square inch; then the defecation or changing the sugar from an acid to an alkaline, which is accomplished by using lime, phosphoric acid, or other defecator. Impurities also are thus removed, and the sugar juice is whitened. The mixture is then heated, water is driven off, and the juice is reduced to a sticky mass, after which it is placed in vacuum evaporators, which reduce it to crystals. By centrifugal action the crystals are again separated from the remaining liquor, from which in turn some sucrose is finally extracted.

By-products remaining are the crushed cane, used for fuel; press cakes, used for fertilizer; molasses, used in making alcohol, fertilizer, food or fuel.

At this point, however, the sugar does not test high enough, the standard being 89 for poorer grades and about 95 for better. Low selling price of poorer grades discourages manufacturing them. Further refining consists of dissolving the sugar crystals again in water, spinning the resultant liquor in centrifugal containers, after lime is added to defecate it; filtering the liquid through bags or through animal charcoal or boneblack (this removes all coloring matter); finally, evaporating off the water from the syrup in vacuum pans somewhat as before. The sugar is now left in the crystal form familiar to us as granulated sugar. Cube, loaf, or slab sugar is made by pressing the grains in molds before they are perfectly dry.

Beet sugar. Sugar beets are extensively grown in Europe, in some states of our union west of New York, and in southwestern Canada. Seed is sown closely in rows, the young plants are thinned to about 6 inches apart, and the best grown beet is small, weighing about one pound, and looking like a top. Machines cut the roots, the beets are pulled by hand, topped, and sent to the factory, or flushed there in flumes; sometimes they are left in the field, in covered or protected piles, for a time, for some freezing does not harm

them. Juice is extracted by diffusion in 12 or more cylindrical vessels, after the roots are cut into V-shaped slices. These containers are connected, and the juice is run from one to another by water pressure from beneath. Finally, the juice is drawn from the last one or ones filled, tested, and sent to the refinery. Pulp is also finally removed, and every six to ten minutes one of the containers is filled anew with sliced beets. Next the pulp is strained from the juice, lime carbonate is added for the defecation, and then comes a further treatment by carbonation, accomplished by injecting one or more charges of carbonic acid. Next comes the purification by a second carbonation, and the drying, and crystallizing about as in refining cane sugar. Granulated sugar of fine texture is the usual product of the American beet refineries.

Maple sugar. In early colonial days the New England farmers made maple sugar, since cane was hard to get or too expensive. This product is still extensively made, the total production yearly being about 30 million pounds, about 90% being in the form of syrup, one gallon equalling about 8 pounds. The chief source is the sugar maple, which is found from Newfoundland to South Dakota and south as far as South Carolina. New England, especially Vermont, New York, Ohio, Michigan, and Minnesota are the chief centers of production, the first three named furnishing three-fourths of the total output. Each maple tree will make from 2 to 3 pounds of sugar a year. The forest is tapped early in the spring, the sap is collected, taken to the boiling plant or refinery, and here is reduced to thick viscous fluid by successive boilings. Kettles are still used, but mechanical evaporators have replaced them largely in large-scale production. The syrup is reduced to sugar by additional boiling and cooling. In color the sugar runs from light, whitish yellow to dark brown, depending on purity, the lighter kinds being most free from coloring matter or impurities.

Other commercial sugars. Glucose is extensively made in the United States from corn or Indian maize. The process is quite similar to that of ordinary sugars. It is used in table syrups, in about the proportion of 85% glucose, and 15% of cane sugar. Enormous quantities are used in filling sole leather and in making tan extracts, in jellies, preserves, and in brewing. Molasses, a by-product of sugar refining, is a dark fluid, used in cooking and liked by children to put on bread, the term in England usually being treacle. *Fructose,* quite similar to glucose, is derived mainly from fruit juices, and is used as sweetening, and often prescribed for diabetic patients who cannot use ordinary sugars. *Dextrin* is produced from starch, along with glucose or grape sugar and maltose or malt sugar. It is used in making glues and in sizing cardboard. Various chemical sugars, like sugar of lead, have specialized uses in arts or medicine. *Saccharin* is really not a sugar and has no food value, but is 300 times sweeter than real sugar, and so is often used as an adulterant sweetener. It is derived from refining coal tar, and there are several varieties.

Sugar statistics. About 30 million short tons of raw sugar are produced annually, cane leading by somewhat more than half. In order, the main producers are Cuba, British India, Java, Germany, Russia, Czechoslovakia, and the United States. The amount has almost doubled since 1900, and consumption in the United States has kept pace accordingly, yet United States production is only somewhat more than one-twentieth of the world total. The British Dominions produce one-fifth, and consumption in the United States, United Kingdom, and India includes about one-half that of the world at large. Australia, New Zealand, the United States, and Denmark lead in per capita consumption, in the United States its being about 105 pounds yearly, an increase from 79 pounds since 1910, and from 91 since 1920.

SYNTHETICS. Man is always looking for easier and cheaper materials in commerce. These often appear in three forms,—imitation, substitution, and synthetic creation. An imitated product is one which resembles another, but really does not have all, or sometimes even the essential characteristics; substitution is the use of one article or product for another, as oleomargarine for real butter. Synthetic products are those which chemically are the same as the natural, or only slightly differing. Here the modern chemist has opened a book of magic more wonderful than any devices of the *Arabian Nights.* Rubies and emeralds are now made in the laboratory. To list even the main classes of synthetics would take several books if they were described at all. Here we mention only a few that are typical, and some that are spectacular.

Synthetic plastics are already touched upon in the articles on *Cellulose, Leather, Resins, Rubber, Silk,* and *Wood.* Besides celluloid already described, many useful plastics are made of phenol or carbolic acid and formaldehyde, gums, resin, coal tar, oil, and others. *Bakelite* is one of a large group of compounds of phenol and formaldehyde, treated with an alkaline, the result being a viscous mass, which by heat becomes intensely hard and insoluble. It is the invention of L. H. Baekeland (q. v.) a Belgian professor and chemist. Among the many substances, some familiar ones are insulating material for electric connections, tops for bottles, substitutes for ivory, lubricant for gears, and lacquer. Products in the same class are formin, redmanol, halowax, condensite (quite familiar in the Edison phonograph discs). Megramite, one of the same class, was much used during the World War in Australia as a material for containers. S. Sato of Japan has excelled celluloid in his product named satolite. Other resinous or similar compounds are glyptol, of which glycerine is a base; acrolite, made of glycerine and phenol; bettle resin, much used in England for making decorated ware, and pallopas in Germany, used instead of glass for automobile wind-shields.

Medicines, dyes, and *perfumes* are increasingly made by synthetic chemistry. *Analysis* tears down, *synthesis* is just the opposite,—it builds. The chemist takes two or more natural elements, combines them, and a new product results. Among the medicines that do not occur as such in nature, but are compounds made by the chemist, are chloroform, which results from treating alcohol with bleaching powder; ammonia, made by the dry distillation of animal or or vegetable substance, or by the action of water on magnesium nitride or some similar product; camphor, refined by distilling a natural product; menthol, a crystalline compound derived from peppermint. Other medicinal or antiseptic derivatives are ether, salol, chloral hydrate, salversan and its improved forms, Bayer 205 (powerful internal disinfectant), picric acid (this used as antiseptic, dye, and one component for explosives), aspirin, antipyrin. Some of these are derived from coal tar. Others help us run our automobiles, roof our houses, flavor our drinks, color our clothes, perfume our buildings,—and the list can be extended much farther.

Thus our modern chemical wizards far exceed the wildest dreams of the ancient sages and medieval alchemists. Already over 50,000 dyes (shades and tints of colors) not found in natural state have been developed in the laboratory. Every day new surprises seem to await the worker in this field of synthetics. First the coal or other natural product, then the coal tar, then the intermediate, and finally from this the myriad of special products. For other illustrations see the article on *Dyes.*

Synthetic perfumes. The delicate odors of commerce, once the results of arduous toil or extensive travel, now can be produced at our doors by the modern chemist. All he has to do is to analyze the natural odor or essence of the flower, find its chemical sign and secret, with its formula, and he can ordinarily produce it in the laboratory. Synthetic perfumes are not imitations; they are the real thing,—same delicate fragrance, same chemical compound and probably even purer than the older, hand-made varieties. So we have attar of roses, as choice as ever produced in the fields of France, jasmin, lilac, cinnamon, musk, narcissus, orange flower, carnation, gardenia, peach, tonka bean, vanilla, and scores of others.

Commercial importance of these products can hardly be exaggerated. Though men may be thrown out of work by the laboratory process, others share the benefits of cheapness and abundance. The United States government, in the operations at Muscle Shoals, Alabama, intends to produce nitrates rivaling those found in natural state in Chile and other remote lands. Before 1910 huge quantities of natural nitrates were imported by Germany, and now that country can export larger quantities of nitrates made by skilful chemists. Once Japan had the natural monopoly of camphor from the island of Formosa; when the synthetic product came on the market, the price fell from about $2 to 30 cents a pound. Six million pounds are required annually for cellulose products alone. Menthol from carefully and laboriously collecting and pressing peppermint for the oil once cost $20 a pound, and now it can be made in the laboratory or chemist's shop for less than $4. These are mere samples of the value of synthetic products.

TOBACCO. Columbus found the Indians called a native plant tobago, named perhaps from an island off South America. Seeds were carried to Spain, thence to France later by Jean Nicot (whose name is given to nicotine, the alkaloid poison, the active principle of tobacco), and by 1565 Sir John Hawkins or others had introduced some of this weed into England. Today it is known around the world. Eighteen of our states produce it extensively, leading in order North Carolina, Kentucky, Virginia, Tennessee, South Carolina, Pennsylvania, Georgia, Ohio, Wisconsin, Connecticut, and Maryland. North Carolina grows about 400 million pounds, Maryland only about 30, and 7 other states less. Other countries are Brazil, China, Dutch East Indies, Mexico, Algiers, and in Europe, Russia, Greece, Turkey, Italy, Bulgaria, Germany, France, Hungary, and Belgium. In the British Empire the chief countries are South Africa, India, North Borneo, and Canada. Of the total world crop of about 4 billion pounds, the United States grows about two-fifths. Cigars, cigarets, smoking tobacco, each in about equal amount, comprises nearly two-thirds of the total usage; chewing tobacco, snuff, and nicotine by-products such as sprays to kill plant pests make up the remainder.

Growing tobacco. This plant grows rank and tough, requires a good soil rich in potash, lime, magnesia, iron, and other elements, and must have right proportions of both moisture and sunlight. In Connecticut and elsewhere fine types are grown under canvas or glass. Of the nicotine

family, to which tobacco belongs, among fifty varieties are such well-known products as the red pepper, tomato, potato, eggplant. Some soils require artificial fertilizing, notably so unless crop rotation is practiced to give the soil a rest from the heavy drain tobacco makes from it. *Seeds for propagation* must also be carefully chosen from the matured blossoms left on some hardy stalks for this purpose. If every seed could be matured, one typical plant would grow enough of the small individuals to plant 200 acres of land. Seeds must be planted early in hot-beds or other most favorable places, and much attention is required for transplanting, developing, removing the surplus branches called "suckers," removing the top unless seed is desired, and finally in cutting, curing, and marketing. Hail, insect pests, excess of rain, or of sun with dryness, will spoil the nicest leaves. Altogether this crop requires skilful and constant watching and tending. In the southern states certain areas produce a fine heavy, sweet and fragrant leaf; in most northern regions, it is lighter, has no pronounced odor, and is more delicate. Cuban, Turkish, East Indian, and other varieties have also their own characteristics. Yet claims made for one region or another as to excellence and aroma are often exaggerated and unduly stressed commercially. The same might be said as to mildness, freedom from "pull" or "burn" and other qualities, though naturally tobaccos have their peculiar traits and values the same as all other natural or artificial products.

Tobacco products. Curing takes place out of doors, or now in this country in barns for the purpose, with open sides for circulation of air. All tobacco improves by fermentation and ageing. When it is sufficiently dried on the stalks, it is stripped off, usually bound into bundles for the curing process, a process of days, months, or even of years as practiced by dealers and manufacturers in different lands. Sometimes it is sweetened, treated with steam, or in several other ways. Cigars are often made of grades or types of tobacco, often grown hundreds of miles apart. The wrapper necessitates long and perfect leaves; the inside or filler, a different kind or smaller parts. The wrapper may be from Connecticut, the filler from Cuba or Turkey or Java. Some of the foreign makes have acquired great reputation, whether deserved or not is probably a matter of personal taste. Cigarets are fine-cut tobacco, dried, often pulverized, and slipped into parchment cylinders. Great Britain uses much Virginia tobacco; so do the northern states, as well as leaf from Kentucky, the celebrated Burley kind, and from remote parts of the world in much smaller quantities. *Snuff* is tobacco ground or finely pulverized for use in the nostrils, a custom declining, but before 1800 greatly in fashion.

Machinery now rolls cigars, cigarets, and other forms. Of the cigarets, one machine may make 250,000 a day, and one-tenth that number of cigars, replacing many individual cigar makers. Indeed, the complete process, including placing them in boxes, is now done largely by mechanical means.

TURBINES. Windmills are propelled by intermittent gusts of wind; turbines are similar, but are propelled by constant jets of water, steam, or any fluid. Hydraulic or *water turbines* are of two classes, the Pelton and the Francis, the first of these being a simple form with one nozzle that delivers water to or upon the wheel, or upon buckets that are fastened upon it. The Francis type has many guide vanes or openings for forcing the water, under great pressure, so that it turns the turbine or wheel. The Pelton or simple type has attained a force of 30,000 horse power; the Francis more than double that, and both could be increased.

Steam turbines, as developed by Sir Charles A. Parsons to great efficiency, now promise considerable development in the future. The DeLaval cream separator was an early form of steam turbine. Parsons introduced the idea of compounding the pressure by arranging a series of simple one-wheel turbines, so that all energy would be utilized, and the steam leaves one unit for another still under some of its original force. Though demonstrated first in 1884, it was not till about 1900 that Parsons' principle was applied in any degree. He built the first practical steam turbine ship in 1894, but not until 1907 did he succeed in convincing the skeptical. In the Diamond Jubilee Naval Review, he attained a speed of 34 knots, then an incredible performance. The *King Edward*, 1901, however, was entered in the merchant marine; and the *Carmania* in 1905 in passenger service. The *Lusitania*, the *Mauretania*, holder of a transatlantic speed record, the *Olympic*, *Otaki*, and other ships have demonstrated the superiority of steam turbines for driving ocean liners. Of late, however, the internal combustion Diesel engine seems to promise to be a formidable rival.

TYPEWRITER. Many attempts were made to perfect a mechanical writing machine before Christopher L. Sholes (q. v.) of Milwaukee, Wisconsin, between 1867 and 1873, experimented with different models until on March 1, 1873, the Remingtons of Ilion, New York, bought his rights. Henry Mill in England in 1714 made a model that might have been made effective, had he followed it up. William A. Burt of Detroit in 1829; Charles Thurber of Worcester, Massachusetts in 1843; Alfred R. Beach of New York in 1856; Dr. Samuel R. Francis also of New York the next year; and Sir Charles Wheatstone of England in 1858 were some pioneers in attempting to make a practical machine.

Though the first machine of Sholes looks crude today, it had some features that never have been essentially changed, such as the paper cylinder, line spacing and form of carriage, printing through an inked ribbon, the position of the letters in the bank, and the key lever and releasing wires. Yet the first machine printed only in capitals. Later an extra set of lower case or small letters were added, and on some machines still a third or set of figures. Most machines now have two keys on each type bar.

Further developments. The Hammond typewriter introduced a usable *type wheel* on which the characters are placed. This wheel can be changed for others that have different styles of type, characters, or languages, a great boon to those who want to write in more than one style of type or in more than a single tongue. Some other models like the Burt in 1829 and the Pratt in 1866 tried the wheel, and more recent ones have experimented with the shuttle, on which the various letters are placed, so that the wheel or the shuttle moves to the right place when a key is depressed. *Visible writing* machines, introduced first in 1883, did not become popular until well after 1900. Early models provided for a down stroke of the type on the ribbon; successful ones now have adopted the regular up-stroke as in the regular machines. *Portable machines* have been made in models having either two or three sets of letters on each type bar. Finally, the model requiring two shift keys was replaced by a single one, and additional type bars, which add weight to the machine, but the portable models weigh less than half the weight of regular ones. The *noiseless typewriter*, varying the other types, has a weight on the type-bar which gives it momentum as it comes up, and the impetus is given directly to the type-bar, without the intervening arm or double joint, always a source of noise. *Electric typewriters* have long been projected, and some have been tried, but as yet they are not offered to the public in any quantity.

Special adaptations of typewriters have greatly facilitated moden business. Tabulating devices on regular machines, and special and larger tabulating typewriters, provide for arranging series or columns of figures. Tabular keys allow the carriage to be run forward to appropriate places as provided by tabular stops, adjustable at will of the operator. One of the latest developments is the special *adding typewriters*, which perform simple mathematical operations, such as adding, subtracting, and multiplying, with utmost efficiency. In fact, some machines perform the ordinary operations of bookkeeping. A special form of the *book writing machines* is adjusted so that it will take in an entire ledger or a library book in which any sort of printed notation may be made. *Telegraph printing machines* have long been projected, and only recently perfected, though the familiar stock ticker was an early type. Now it is possible for a person to sit at a typewriter and send messages hundreds of miles and have them typed at the receiving end just as they are sent. Such a process obviates the use of a telegraph code. Even Morse himself, inventor of the telegraph, predicted some such development, first with the dot and dash system, and now in regular letter and word formations. Systems like the Western Union Simplex machine and others like the Morkrum Telegraph Printer use a wheel or other device, with a code arrangement, so that letters may be typed from this on paper. In one of the "five-unit" codes, the 26 English letters and certain other forms up to 31 are arranged so that each character has its own place on a wheel, and the wheel is moved by electric magnet to the proper space at the printing end to correspond with depression of the type keys at the receiving end. The dot and dash printers seem destined to give way to these newer modes, a number of which are now patented and on the market. Elisha Gray (q. v.) long ago invented the *telautograph*, a similar device for transmitting handwriting by electricity. The transmitter writes on a metal plate with a stylus or device having a metal point, and his exact handwriting is duplicated on the receiving end. Sending a series of impressions by wire now transmits photographs, or allows artists to make them according to the numbers or arrangements of a code.

VARNISH. Resinous material, various oils, and turpentine or benzine or some other liquid are the chief components of varnish, to which often a special drier is added. For ordinary uses, three classes of varnish are recognized: 1, oil varnishes; 2, spirit varnishes; 3, insulating varnishes. Ordinary varnishes are thin and glossy or flat, transparent, black, or colored according to design of the makers. Black japan is a type of varnish. Colored varnishes are made by adding some aniline dye or pigment. Good varnish dries easily to a smooth, hard, and firm finish, which never cracks, pits, turns white, wrinkles, bubbles or blisters. Varnish must not be polished or washed with any gritty, sticky, oily substance. Clean, cold water and a good soap free from too much alkali should be applied with a soft cloth or a light sponge. Likewise varnished floors should be treated only by some light dusting or polishing, and never must be pounded, scraped, or scrubbed.

Oil varnishes. Linseed oil, with some tung or Chinese oil in certain cases, may be used when free from all water or other liquids. The resin is of fossil origin, except asphaltum, and some natural or tree gums also, such as kauri from New Zealand, animi and copals from Africa, and manilla gums from the East Indies and Philippines. The turpentine is distilled from resinous trees. Lead, manganese, or some similar salts are used as driers. All these ingredients must be mixed with great care, first the gum parts, then the oil, and finally the drier. Turpentine is added when the whole has cooled somewhat. Though the proportions greatly vary, to every 50 pounds of gum, from 4 to 14 gallons of oil are used, and from 10 to 15 of thinner. Better grades have more oil, highest quality gum, and not so much thinner perhaps. White spirits from distilling turpentine, or coal tar naphtha, shale spirit, and other liquids are used sometimes as substitutes in poorer products.

Spirit varnishes. Soft gums are used for these, liquefied in alcohol, turpentine, ether or some other solvent. Shellac, sandrac, damar, and mastic are the chief gums or resins used. *Gum shellac* is made from the natural bark or stick-lac of Asiatic trees, and it is mixed with water or other liquids, to which are added coloring matter if the product is not to be clear or transparent varnish. The original colors of the product, however, are first removed. White shellac is the natural product bleached with chlorine, the original or yellowish substance being called orange shellac. Petroleum benzine is a cheap substitute. The name lacquer for certain quick-drying varnishes has become popular. *Pyroxylin* varnishes have cellulose as a base, acetate as a solvent, and benzol for quick drying. If the solvent evaporates quickly, the varnish will harden soon; and for this reason various quick driers are used to hasten the process. The old asphaltus varnish, once very famous, dries less quickly, but it is not likely to crack as are those which dry rather fast.

Insulating varnishes. These types resist wear, are used for insulation of fire, to protect surfaces from rust, to treat certain kinds of paper and fabrics. Collodion or "liquid court plaster" is used in making photographic films, cellulose or pyroxylin for floor fillings, spirit or copal varnish for cementing, pitch varnish for heavy insulations. Such may be used on leather, iron, electric wires, or in preservative paints.

Special purpose varnish. One large firm makes over 200 varieties of varnish for many different surfaces. Not the range in cost but more definitely the particular use or purpose determines what kind of varnish should be used. One gentleman bought piano varnish at $5.50 a gallon for exterior work on the supposition that this would necessarily be better than spar or marine varnish at $4. Not being for outside wear, the fine piano varnish went bad in a few months. Nor does thickness make the best varnish. Some excellent types take about 750 coats to build up one inch of surface, and they are suitable for particular purposes, probably not for outside wear. With suitable materials and woods, even the thinnest may often be the best. Furniture varnish, or coach as it was once called, is thin, hard, and highly decorative. Rubbing varnish or flatting is dull, tough, and durable. Baking varnish, often called japan, is for metal work, and some black types are for preserving only. Other varieties are linoleum, leather, piano (but sounding boards must have a different type), motor car, the last fine, thin, and unlikely to change color; and the list could be greatly multiplied. Japan goldsize contains only 4 gallons of oil to 50 pounds of gum and 12 gallons of thinner.

WASTE PRODUCTS. See under *By-products.*

WATCHES. Before 1400 portable timepieces were unknown. Earliest watches were like small clocks, carried at the belt and not in the pocket, and one popular kind was named Nuremberg egg, from the shape and from the town where it was made. Changes in temperature and differences due to slackening of the spring tension, as the watch begins to "run down," for three centuries made watches somewhat unreliable. Thomas Tampion about 1700 invented the "dead-beat escapement," and this helped to keep timepieces more regular, and yet the hairspring still varied as temperature changed, causing loss or gain in time. This was corrected late in that century by Pierre LeRoy, and perfected by Thomas Ernshaw, by using different metals in the rim of the wheel, to cause compensation enough to offset any changes due to weather variations. Today a recent alloy, called invar, fulfills the same purpose. Except for refinements and mass production, explained later, not many important changes have been made in a century. Refinements consist of more and better jewels, all sorts of sizes and varieties of case, wrist watches, striking watches, other special purpose ones. Watches for use on railroads must not vary more than one or two seconds a day. Recently, palladium has replaced steel in hairspring, for the latter often became magnetized when near a dynamo.

Special types of watches. Apart from the usual refinements, changes in models by different companies, and other style variations, a number of special purpose watches have been developed. The *chronometer*, first described in 1714, is a variety of large watch for marine purposes, much used for determining positions of ships at sea. This form differs from ordinary watches in that it is set so as to remain horizontal, no matter what angle the ship strikes, and in that it has a helical balance-spring, special escapement, and requires no oiling. Such instruments must not vary in any appreciable degree, and not enough even in a month to make more than 10 miles difference in the measure of the whole voyage. The *stop watch* is like others, except that it has an added hand, which indicates fractions of seconds in terms of fifths. The hand may be started in motion by pressing the top stem of the watch once, and may be returned to zero by pressing again, and finally set in motion a second time by pressing once more. Such watches are used in determining athletic records and scientific data.

Mass production. Once all parts were made tediously by hand. In 1828 Henry Pitkin at Hartford, Connecticut, began quantity and standardized production. Nowhere is the influence of modern machines better illustrated than in making watches. Ten or a dozen inventors have been kept occupied making the machines and tools that, in turn, produce the watch parts. Six chief United States factories now turn out a combined total of 8,000 timepieces a day, or nearly 3 millions in a single year. Mass production began at other Connecticut points before 1890, the result being both better and in some cases cheaper watches, even to "the watch that made the dollar famous." The New Haven Clock Company first made standardized parts on a great scale. The Waltham Watch, however, was the original American make, but now there are a score of companies producing in 30 different establishments, such as Hamilton and Elgin. Watches made in Switzerland, notably Neuchâtel, have long been famous. Sizes have been reduced two-thirds, and in most models still more in recent years. Nicholas Facio, in the eighteenth century, introduced jewels for the pinions to run in, and diamonds, rubies, and some artificial stones recently have been much used, while the number has increased from a few to a score in the best types. Frames are plated with chromium now, besides the different kinds of gold, silver, and other metals long used. Frame plates are stamped out at the rate of 30,000 a day; wheels, 50,000 or more; screws, 800 to 2,000; pinions, 2,000 or more; and dials, from 5,000 to 8,000. One make of watch requires 117 separate pieces, all or most of them made by automatic machinery; while the back plate, taking 17 operations, requires 25 men for this one part, and others in proportion. An entire watch is turned out every 36 seconds.

WEAVING. Before the dawn of authentic history weaving had reached a high state of perfection. Every age has contributed something, either in the way of material, style of weave, or coloring. Modern decades have found men ransacking the entire earth for vegetable, animal, and mineral raw materials. Rayon, other types of process silk, and other imitations have of late come upon the market.

Types of weaves. The art of weaving, no matter of what sort, consists in interlacing one lengthwise thread, called the warp, with another running crosswise, called the woof, or sometimes weft. In this respect at least weaving differs from plaiting, netting, felting, hose and lace making. Yet the varieties of threads and shades and tints have been varied in countless ways since mechanical looms came into usage. Four classes of weaves will now be explained and illustrated.

1. This type consists of one warp and one woof, each set being arranged in parallel lines. Simple illustrations include plain cloth, or the different checker-board kinds; alternating thick and thin threads, which give the washboard or hill and valley effects, such as in repps, poplins, and cords; and diagonals or twills. By varying and reversing the warp and the woof in diagonal patterns, various effects of lozenges, zigzags, and the like are formed. Satin has the bulk of the warp on the face of the pattern; sateen differs in having the bulk of the woof on the face, making it smooth and continuous. Brocades have floating sets of both kinds of threads on the surface.

2. This includes all backed or reversible fabrics, those decorated with extra stuff, and compound weaves. Either warp or woof may be on the backing, hidden by the face or main weave. Reversible patterns have the same pattern on both sides. Compound weaves excel the backed. Other variations include single thread effects, united texture patterns, variation of colors at intervals as in Kidderminster carpets, tapestries made by looms, and even repps with figures.

3. This includes the piled fabrics, in which some threads stand out, or at right angles to the rest. This effect is produced by cutting some of the threads after the cloth has left the loom, so that the severed ends stand up from the background. Chenille patterns are woven twice, first to make the warp threads rather far apart, with woof of several colors passed from side to side, and, second, to lay the colors, so that the pile projects on both sides of the cloth. Some variations occur. Colors are sometimes printed on the yarn, sometimes on the fabric after it leaves the loom. Tapestry carpets are of the first variation. In Wilton or Brussels carpets, at least one-fifth of the pile warp is hooked on a wire, removed successively from each loop.

4. Type four includes the crossed weaving, as in gauzes,

by intertwisting the threads. After two warp threads are twisted together, spaces are left, but the fabric is very strong. Alternating from left to right, one of the pair of threads in each set is made to cross the other. Lapped weaves add a pattern of some sort or a figure to the ordinary crossed gauze. All these patterns, no matter how intricate they seem, are easily made by machines in modern days, and many more too complicated to explain here.

WOOL. Ancient literatures, even before Biblical ages, refer frequently to tending and keeping sheep for food or for clothing. Until cotton goods came into use in England toward the close of the eighteenth century, wool was described as "the flower and strength and revenue and blood of England." Today it is still a basic article of commerce in many lands. Primitive and remote peoples are still in the pastoral stage, given much to tending herds and flocks. Some of the finest of modern wools are grown by the Indians of the southwestern states. Long and shiny staple wools have long come from certain districts in England, such as Lincoln, Leicester, Nottingham, and Devon. Most of the mountainous regions of the United States produce their own grades and kinds of wool. For centuries Spain has grown the finest merino or Moorish wools. Merino sheep were early imported into Australia, South America, and more recently into South Africa. Australasia for many years marketed huge quantities of native wool, but since 1890 the tendency has been to grow sheep for mutton, and to discard the lean and small merinos that are good for wool. In back or more infertile regions, the small, lean sheep still hold their own as producers of fleeces. Since 1895 Australia has doubled the weight of the fleece clipped from a single animal, the average now being about 7 pounds.

United States census of wool. Sheep were introduced at Jamestown, Virginia, as early as 1609. Massachusetts Bay Colony began to establish the industry at Rowley in 1643. Later and before 1870 the merino seems to have been the favorite kind, but more recently English animals have gradually gained in importance. Yet we still import, on the average, about 40% of the wool we use. Manufacturing centers for making up wool into garments shifted somewhat in the last generation, and still show this tendency, but not as much, of late, as the cotton industry has moved about. In the making of cloth (not in wool production), New England still leads, the Central Atlantic states account for about a third of the cloth, and the western states only about 5%. Thus about 90% of the suitings, overcoatings, and dress goods are still woven east of the Mississippi; and yet the chief centers of blankets, some yarns, and knit goods are moving westward, some important ones now being in Wisconsin, Minnesota, Tennessee, and Oregon. Boston, Chicago, and New York are trade centers for wool for carpets, and with Philadelphia are also trade centers for the raw wool. A recent report of the National Association of Woolen Manufacturers, an organization to standardize wool articles, reports that the clip of fleeces for the entire world in a single normal year is well over 3½ million pounds.

Cloths from wool. United States buyers of wool recognize mainly three grades of the raw product: fine, from 1 to 4 inches in length; medium, 2 to 5; and long, from 5 to 15. The fine or short is used largely for suitings, dress goods, and fine broadcloths, the amount being over 40% of the total production. Medium length is for blankets, tweeds, and flannels, the amount being over 54%. Long wool, less than 4% in the last census, is for lustrous yarns, braids, and goods for dresses. As to kinds of wool, however, many classifications exist. Australia recognizes over 800 varieties. The choicest wool comes from the breast, shoulders, and sides of sheep; underneath the animal it is worn short, dirty, and often of inferior grade otherwise. Sorting is the first step; cleaning, the second; blending, the third in getting wool ready for spinning. Potash soap or a naphtha solution in the first stage of cleaning, is the popular solvent; after which burrs and other vegetable matter are carbonized by sulfuric acid, followed by a neutralizing bath to take out any remaining acid. After blending, the fourth step is carding, and then the wool is ready for the spinners. Carding is the process of pressing the fibers in some manner or pulling them out and making them lie lengthwise, and somewhat flat, but the tendency for wool is to curl and to stick together, due to minute hooks of the product itself. This tendency is used to advantage in the final making. Usually, the wool is washed in olive oil to facilitate the carding, and sometimes it is run through rollers. Spinning machines or "mules" are extremely intricate, automatic, and nearly human in their skill and intelligence. Scores, sometimes hundreds of individual spindles make up a single unit or mill. Spinning is the process of drawing out the little threads and combining them into small units. The yarn often goes through other processes, before it is made into cloth, and some of these are sizing or coating with some liquid substance to stiffen the yarn, drawing it in, making it into warp, and winding it onto a loom beam.

Weaving and finishing. Though this process itself is simple, the machinery to accomplish it is very elaborate. Weaving is the process of making the threads mesh together vertically and horizontally, or up and down, and across from side to side. Wool, being much harder to weave than cotton, requires some other treatments. These are mainly scouring, dyeing in bulk or in separate pieces, shrinking, napping, and shearing. Shrinking leaves the surface solid or like felt, and so napping is employed to make the surface stand out or up by running over it a roller fitted with wires or a teasle. Shearing is accomplished much on the principle of a lawn mower cutting the grass. During these processes, often burls or other imperfections appear, and some mending, adjusting, or other special finishings are needed.

Types of yarns. In ordinary *woolen yarns* the fibers intercross; in *worsteds*, they are the longer kinds and run parallel. Woolen is easily felted or matted down; worsted is usually spun on a frame into compact thread. In worsted yarns most of the shorter fibers are combed out by a special process. Woolen cloths attain density by a shrinking, worsteds attain density by the original yarns. Finer lengths taken out in making worsteds are called *noils*, and they are used as fillers for inferior weaves of cloth. The name *shoddy* has been employed to short fibers, which are not necessarily poor ones. Another application of the name shoddy is for processed or remade wool from clothing already used and returned to the manufacturers. In making worsted yarns, the Bradford process requires longer yarns of greater strength and drawing power. The Continental process makes softer and finer yarns.

Some recent tendencies have greatly improved the making, finishing, and more especially the marketing of woolen products. Fluctuations in demand and price have been great draw-backs in past years. Direct selling to the trade, without the intervening medium of jobbers or middlemen, has stabilized the industry to some degree. Greater uniformity in machines and methods has also helped. Other elements are reduction in weight of men's clothing from about 20 ounces to 17 or even fewer, frequent changing of styles or types of fabrics, and steady stimulation of demand, which is about 20% higher than it was 25 years ago.

USEFUL NATIVE WOODS.

WOOD.	Weight. Pounds per Cubic Foot.	Pounds per Square Inch.		REPRESENTATIVE USES.
		Crushing Strength.	Breaking Strength.	
Alder	28-35	5,000	10,000	Manufacture of furniture.
Arbor Vitæ	20	4,400	7,300	Posts, railway ties, etc.
Ash, White	41	7,300	14,000	Wagon building, axe handles.
Ash, Hoop (Black Ash)	35	6,100	11,500	Agricultural implements, carriages, furniture, tool handles, and interior finish for houses.
Ash, Mountain	34-37	5,500	6,300	Flooring.
Ash, Oregon	36	7,500	9,500	Furniture, carriage frames, wagons, cooperage.
Ash, Prickly	31-37	6,500	10,000	
Basswood (Linden)	25-26	5,900	8,000	Cheap furniture, wooden ware, paper pulp, inner soles of shoes.
Bay, Loblolly	29	5,500	9,400	Cabinet making.
Bay, Red (Isabella Wood)	40	8,000	12,800	Cabinet making, interior finish for houses. Formerly shipbuilding.
Bay, Rose (Great Laurel)	39	6,300	9,300	Tool handles, engraving.
Beech, American	43	7,000	16,300	Shoe lasts, plane stocks, shipbuilding, handles, and fuel.
Birch, White	36	5,000	11,900	Spools, shoe pegs, hoops for barrels, and wood pulp.
Birch, Black	47	5,600	11,500	Furniture and occasionally shipbuilding.
Birch, Yellow	41	8,900	17,700	Furniture, boxes, and hubs for wheels.
Birch, Canoe	37	7,000	14,000	Spools, shoe lasts, turnery, wood pulp, and occasionally lumber.
Box Elder	27	6,400	11,300	Cheap furniture, interior finish for houses, paper pulp, etc.
Boxwood (Flowering Dogwood)	51	7,700	12,800	Cabinet making and turnery.
Buckeye	27-28	4,500	7,000	Artificial limbs, paper pulp, and occasionally lumber.
Buttonwood (Sycamore)	35	6,500	9,000	Tobacco boxes, butchers' blocks, manufacture of cheap furniture.
Cedar, Red	31	6,000	10,500	Interior finish for houses, linings for closets and chests, and manufacture of lead pencils.
Cherry	36	7,800	11,700	Cabinet making, and interior finish for houses.
Chestnut	28	5,500	9,800	Cheap furniture, interior finish for houses, railway ties, etc.
Chinquapin	37	6,200	10,400	Agricultural implements, railway ties, fence posts, and rails.
Coffee Tree	43	5,800	10,900	Cabinet making and fence posts.
Cypress, Bald	27	6,000	9,100	Lumber for construction, railway ties, and fence posts.
Elm, White	40	6,300	12,100	Hubs of wheels, saddle trees, flooring, cooperage, and boat and ship building.
Elm, Red (Slippery Elm)	43	7,700	12,300	Fence posts, railway ties, sills for buildings, hubs for wheels, and agricultural implements.
Elm, Cork (Rock Elm)	45	8,500	15,100	Agricultural implements, frames for chairs, hubs of wheels, sills for buildings, etc.
Elm, Winged (Wahoo)	47	6,300	10,200	Hubs for wheel and handles for tools.
Eucalyptus (Blue Gum)	61-65		13,000	Rollers, paving blocks, shipbuilding, and carriage making.
Fir, White	24	5,600	7,000	Interior finish for houses, packing cases, wooden ware.
Fir, Yellow (Oregon Pine) (Red Fir)	32	7,500	12,500	All kinds of construction, railway ties, piles, and fuel.
Gum, Cotton	29	5,200	9,300	Wooden ware, broom handles, and vegetable boxes.

WOOD.	Weight. Pounds per Cubic Foot.	Pounds per Square Inch. Crushing Strength.	Pounds per Square Inch. Breaking Strength.	REPRESENTATIVE USES.
Gum, Sour.....	40	6,700	12,000	Hubs of wheels, rollers in glass factories, wharf piles, and ox yokes.
Gum, Sweet..... (Red Gum)	37	6,700	11,100	Outside finish for houses, cabinet making, paving blocks, wooden dishes, fruit boxes.
Hackberry.....	46	7,000	12,200	Fencing and cheap furniture.
Hemlock.....	26	5,500	10,200	Outside finish for houses.
Hickory..... (Pig Nut)	51	8,300	15,400	Similar to those of Shell Bark Hickory.
Hickory..... (Shell Bark)	50-52	9,000	17,000	Agricultural implements, carriages, wagons, baskets, etc
Honey Locust.....	42	7,200	13,100	Fence posts and rails, hubs of wheels, and construction.
Hornbeam..... (Blue Beech)	45	7,200	16,300	Levers, handles for tools, etc.
Ironwood..... (Hop Hornbeam)	51	7,800	16,000	Fence posts, handles for tools, and other small articles.
Laurel, Cal.....	40		11,400	Shipbuilding, cabinet work, crosstrees, etc.
Laurel, Madroña..... (Madroña)	43		12,000	Gunpowder, charcoal, and furniture.
Magnolia, Mountain. (Cucumber Tree)	29	6,000	9,400	Cabinet making, cheap furniture, broom handles, pump logs, etc.
Maple, Hard..... (Sugar Maple)	43	8,000	13,600	Furniture, cabinet making, interior finish of houses, shipbuilding, turnery, flooring, saddle trees, etc.
Maple, Oregon..... (Broad-leaved)	30	5,500	9,700	Furniture, broom handles, etc.
Maple, Red.....	38	6,600	11,500	Chairs, cabinet making, turnery, gun stocks, etc.
Maple, Soft.....	32	6,900	14,500	Furniture and flooring.
Mesquite.....	47	8,500	6,800	Flooring, turnery, and largely for wooden pulp.
Mesquite, Screw-pod	47	9,600	12,700	Furniture, fellies of wheels, paving blocks, and charcoal.
Mulberry.....	37	6,000	10,900	Fencing, cooperage, shipbuilding.
Oak, Burr.....	46	7,000	13,900	Same as White Oak.
Oak, Live..... (Virginia)	59	7,800	14,400	Occasionally for shipbuilding.
Oak, Live..... (Western)	53	7,800	18,000	Agricultural implements, wagons, etc.; most valuable oak of Pacific coast.
Oak, Post.....	52	7,000	12,400	Fencing, railway ties, fuel; also for cooperage, construction, etc.
Oak, Red.....	41	8,600	16,900	Construction, interior finish for houses, and furniture.
Oak, White.....	46	7,400	12,800	Shipbuilding, construction, carriages, agricultural implements, cabinet making, cooperage, etc.
Osage Orange.....	48	11,600	16,000	Fence posts, railway ties, wheel stocks, and paving blocks.
Pecan.....	45	6,200	8,200	Fuel and occasionally for wagons and agricultural implements.
Persimmon.....	49		12,400	Plane stocks, shoe lasts, etc.
Pine, Red..... (Norway Pine)	30	6,400	11,300	Used for all purposes of construction.
Pine, White.....	24	4,100	7,000	Construction, cabinet making, matches, etc.
Pine, Yellow or Spruce (Eastern Short-leaved)	38	6,800	14,700	One of the most valuable timbers for lumber.
Pine, Yellow or Southern..... (Long-leaved)	44	9,000	13,600	Masts, bridges, railway cars, etc.
Pine, Yellow..... (Western)	29	5,400	10,200	Largely for lumber; one of most important lumber trees of the West.

WOOD.	Weight. Pounds per Cubic Foot.	Pounds per Square Inch. Crushing Strength.	Pounds per Square Inch. Breaking Strength.	REPRESENTATIVE USES.
Plane Tree (Sycamore)	35	6,500	9,000	Furniture, interior finish for houses, tobacco boxes, ox yokes, and butchers' blocks.
Poplar (Cottonwood) (Big Cottonwood)	24	5,300	10,800	Interior finish for houses.
Poplar, Yellow (Tulip Tree) (Whitewood)	26	5,000	9,300	Construction, interior finish for houses, boatbuilding, shingles, brooms, and wooden ware.
Quaking Aspen	25	4,700	9,600	Flooring, turnery, and largely for wood pulp.
Redwood	26	6,000	8,500	Lumber, fence posts, railway ties, etc. Most valuable building material of Pacific coast.
Sassafras (Ague Tree)	31	5,500	8,500	Fence posts and rails, construction of light boats, ox yokes, and in cooperage.
Spruce, Black	28	5,800	10,600	Construction of houses, sounding boards, and paper pulp.
Spruce, White	25	4,900	12,900	Construction of buildings.
Tamarack (Larch)	39	7,900	12,800	Upper knees of small vessels, fence posts, telegraph poles, and railway ties.
Walnut, Black	38	8,300	12,100	Interior finish for houses, cabinet making, shipbuilding, etc.
Walnut, White (Butternut)	25	5,700	8,500	Interior finish for houses and furniture.
Willow	27-31	3,800	7,800	Fence posts and fuel.

USEFUL FOREIGN WOODS

WOOD.	Weight. Pounds per Cubic Foot.	Pounds per Sq. Inch. Breaking Strength.	REPRESENTATIVE USES.
Bamboo	19-25	27,400	Posts, poles, utensils, troughs, pipes, roofing, and paper.
Boxwood	64.8		Engraving and mathematical instruments.
Cedar, Spanish			Cigar boxes.
Ebony	74.2		Inlaid work, piano keys, etc.
Eucalyptus, Jarrah (Mahogany Gum)	65	8,900	Marine work, exposed positions, shipbuilding, bridge timbers, street paving.
Eucalyptus, Karrie (White Gum)	63	8,000	Construction, railway ties, piles, marine work, pavements, masts, lumber.
Greenheart	72	10,000	Ship keels, frames, rollers, turnery, beams, planks, piles, tops of fishing rods, veneers.
Mahogany, Spanish (Mexican Mahogany)	45	14,000	Cabinet work, veneers; formerly shipbuilding.
Mahogany, White (Prima Vera)			Cabinet work, furniture, veneers.
Oak, English	51	10,000	Shipbuilding, beams, cabinet work; formerly carpentry.
Pine, Northern	34	7,000	Carpentry, construction, planks, beams, masts, heavy timbers.
Rosewood	64.2		Furniture, piano cases, burial caskets, piano work.
Sandalwood	58		Rich furniture, fine carvings for small objects, as jewel boxes and fan handles.
Satinwood	59.9		Cabinet work and odd sets of furniture.
Teak (Indian Oak)	50	15,000	Furniture, shipbuilding, timbers, backing for armor plates.
Yew	46.1-50.5		Chairs, canes, and whips.

THE MOST IMPORTANT DAMS

Date	Name and Location	Height	Capacity in Million Gallons
1912	Assuan, Egypt	144	1,322,955
1937	Bonneville, Oregon-Wash.	170	.....
1936	Boulder, Arizona-Nevada	726	10,000,000
1934	Cauvery-Mettur, Br. India	215	5,978,750
1930	Conowingo, Maryland	105	107,000
1930	Coolidge, Ariz.	250	400,000
1932	Dneiper River, Russia	200	300,000
1916	Elephant Butte, N. Mex.-Texas	305	860,000
1939	Fort Peck, Missouri	242	6,350,000
1914	Gatun, Panama	105	1,370,000
1941	Grand Coulee, Wash.	553	3,131,000
1925	Harrodsburg, Ky.	275	100,000
1923	Hartebeestpoort, S. Africa	193	410,000
1937	Hetch Hetchy, California	430	1,466,000
1936	Norris, Tennessee	265	1,108,000
1930	Osage, Bagnell, Mo.	148	500,000
1932	Owyhee, Oregon	405	233,000
1922	Pathfinder, Neb.-Wyo.	218	350,000
1911	Roosevelt, Arizona	280	533,000
1910	Shoshone, Wyoming	328	144,000
1938	Tygart River, West Va.	232	106,600

IMPORTANT TUNNELS

Date	Description	Length in Miles
1930	Appenine, Italy	11.3
1884	Arlburg. Innsbruck, Austria	6.36
1898	Boston Subway. Boston, Mass.	3.1
1928	Cascade, Washington	7.79
1916	Connaught. Rogers Pass, B. C.	5.00
1890	Croton. N. Y. City water supply	31.00
1909	Gunnison. Montrose, Colo.	5.8
1924	Holland. N. Y. to N. J.	1.61
1876	Hoosac. N. Adams, Mass.	4.73
1911	Loetschberg. Switzerland	9.04
1900	London Tube. First Lond. Subway	3.5
1928	Moffat. West of Denver, Colo.	6.1
1871	Mont Cenis. Italy to France	7.98
1913	Mont D'Or. France to Switz.	3.75
1907	N. Y. Subways. First in City	24.3
1903	Otiro. Arthur's Pass, N. Zel.	5.37
1940	Pennsylvania turnpike, 7 bores	6.7
1927	Rove, France	4.5

1928	Somport. France to Spain	4.1
1911	Transandine. Chile to Argentina	5.00

PRINCIPAL BRIDGES IN THE UNITED STATES.

Location	Date	Total Length or Channel Span	Details, Features
Albany, N. Y.	1890	360	First cantilever arch.
Arlington, D. C.	1932	216	Double leaf bascule, 4 concrete arches.
Bayonne, N. J.	1931	1,675	Exceeded Hell Gate, N. Y. and Sydney, Australia, as longest arch span.
Bear Mtn., N. Y.	1924	1,632	Suspension, six spans, highway.
Boone, Iowa	1882	2,685	Longest ry. viaduct when built; 185 feet above water line.
Boonville, Mo.	1901	408	6 span, with electric vertical lift, longest ry. lift in world; raises 30 feet in 70 sec.
Brooklyn—N. Y. City ("Brooklyn Bridge")	1882	1,596	3 spans, suspension, 135 feet clearance above water; total length, 5,189; cost $18,000,000.
Cabin John, D. C.	1864	220	For years longest masonry arch in world.
Cairo, Ills.	1889	523	Truss; 12 spans, 10,500 feet in all; once longest bridge in world.
Cairo, Ills.	1929	700	Steel truss cantilever on reenforced concrete piers; seven spans.
Carquinez, Calif.	1927	1,100	Cantilever, 5 span; steel viaduct approaches.
Castleton, N. Y.	1924	1,008	Ornamental spans, railway bridge.
Chicago, Ills. (16th Street)	1920	260	Modern bascule.
Cincinnati, Ohio	1867	1,057	Longest suspension, before Brooklyn Bridge; repaired 1898.
Delaware River, Pa.	1926	1,750	Suspension, Philadelphia to Camden, N. J., 2 spans, 6 lane roadway, 2 sidewalks; cost $36,000,000.
Detroit, Mich.	1930	1,850	Suspension span, longest in world, before George Washington Bridge, New York, 1932.
Dixville, Ky.	1910	864	Lune shaped, two hinged arch, 3 spans, double deck.
Eads, St. Louis, Mo.	1874	520	Cast steel tubing, 3 arches; built by J. B. Eads; cost $5,300,000.
Fort Snelling, Minn.	1927	304	Concrete arch, 13 two-rib spans, 5 trestle spans.
Geo. Washington, N. Y. C.	1932	3,500	Single span suspension to Fort Lee, N. J., 8,700 feet in all; cost $50,000,000.
Geo. Westinghouse, Pittsburgh, Pa.	1933	560	Longest concrete arch in America at time; 5 arches in all; 180 feet cut at one end.
Golden Gate, Cal. (San Francisco)	1937	4,500	Suspension, from city to main peninsula, 8,940 feet in all.
Hastings, Minn.	1895	375	Unusual spiral approach.
Hell Gate, N. Y. City	1915	977	Single arch span, reverse curve in top chord, like imperial Chinese bridge; 4 ry. tracks.
Jersey City, Newark, N. J.	1932	3 m.	Viaduct, most elaborate to date.
Kill von Kull, N. Y.	1932	1,675	Single span, high arch, longest of type; Staten Is. to N. J.
Kinzua, Pa.	1900	2,053	Ry. steel viaduct; replaced iron bridge of 1882.
Louisville, Ky.	1886	360	Suspension, central span, 2 cantilever arms, and 2 side spans.
Manhattan, N. Y. City	1909	1,470	Artistic suspension bridge, New York City to Long Island.
Memphis, Tenn.	1916	790	Cantilever, 5 span, highway and railway.
Metropolis, Ill.	1917	720	Simple truss, 7 spans, nickel-steel girders.
Mid-Hudson, N. Y.	1930	1,500	Suspension, across Hudson at Poughkeepsie, N. Y.
Mingo Junction, Ohio	1910	769	Cantilever, with two anchor arms.
Minneapolis, Minn. (Cappelen Memorial)	1923	400	Longest single concrete span in America to date.
Niagara, N. Y.	1898	840	Arch, 3 spans, elec. ry.
Oakland, Calif.	(1937)	1,700	Suspension, 22,720 feet in all; double deck, 6 lanes for fast, 4 for slow traffic; from San Francisco to Oakland Cost $70,000,000.
Pecos River, Tex.	1891	2,180	Central cantilever, 48 spans, 320 feet above water, for ry.; rebuilt, 1910.
Pittsburgh, Pa. (Smithfield St.)	1933	475	First use of aluminum, with asphalt floor; arch, saving 751 tons weight.

PRINCIPAL BRIDGES IN THE UNITED STATES—*Continued.*

Location	Date	Total Length or Channel Span	Details, Features
Portland, Ore. (St. John's)	1931	1,207	Suspension; over Willamette River; 2 side spans; longest twisted rope-strands in world.
Rockville, Pa.	1901	70	Early use of concrete fill for masonry; 48 spans, 70 ft. long each.
Poughkeepsie, N. Y.	1889	548	Fixed iron cantilever; 7 spans, for two-track railway; strengthened, 1906.
Royal Gorge, Col.	1930	400	Highest bridge above water, 1,050 feet.
San Antonio, Texas	1932	101	Longest one-span rigid frame bridge.
Sault Ste. Marie, Mich.	1913	330	Largest bascule to date; bell, twin type.
Sciotoville, O.	1918	775	Cantilever; two continuous spans of record length.
Tanana Ry., Alaska	1923	700	Single span of special steel.
Tunkhannock, Pa.	1915	180	Viaduct, 12 concrete arches, long held record for such types.
Wabasha, Wis.	1932	396	Unusual type of pontoon.
Wheeling, W. Va.	1862	1,010	Suspension; once longest span of any kind.
Williamsburg, N. Y. City	1904	1,600	First great suspension bridge to use steel instead of stone towers; 3 levels; 7,308 total length.

PRINCIPAL FOREIGN BRIDGES.

Location	Date	Length of Total or of Channel Span	Details, Features
Auckland, N. Z.	1910	3,203	Solid concrete; replaced light suspension.
Avignon, France	1188	108	Remarkably curved arches; 3,000 feet in all; ruined in 1680.
Ayr, Scotland ("Auld Brig o' Ayr")	1236	53	Four segmented arches, recently strengthened, and now used for passengers only. See "The Twa Brigs" by Robert Burns.
Benares, India	1889	356	Simple truss, 16 spans, lattice girders; total, 3,568 feet.
Berwick, Scotland	1928	361	Concrete, 3 main arches..
Blois, France	1724	68	Eleven eliptical arches.
Bonn, Germany	1895	614	Central braced arch, 4 smaller arches.
Bow, England	about 1110	66	Earliest recorded English stone bridge; replaced in 1838 by a stone arch.
Brest, France	1930	612	Concrete arch of novel design and construction; railway, and on upper deck a roadway.
Bridge of Sighs, Venice, Italy	1597	100	Arched, double passageway, between ducal palace and prison; hence name.
Broomielaw, Glasgow, Scotland	1836	58	Seven segmented stone arches; widened from 58 to 80 feet, 1899.
Budapesht, Hungary	1849	666	Chain suspension, 1 central and 2 side spans, 1,250 feet, connecting Buda and Pesht.
Chester, England	1833	200	Single stone arch, longest in England.
Coblenz, Germany	1864	348	First braced, wrought iron arch, with beautiful lattice ribs.
Cologne, Germany	1915	605	Suspension, replacing old pontoon.
Connel Ferry, Scotland	1903	524	Cantilever, with triangular anchor arms, and piers near shore.
Conway, Wales	1826	327	Suspension, harmonized with neighboring castle; improved, 1904.
Conway, Wales	1848	400	First tubular bridge finished.
Crumlin, Wales	1857	150	Tressle, 7 spans, in 2 parts, supported on hollow cast-iron columns, 210 feet high.
Curzon, India	1905	211	Double deck, 15 spans, 3,160 feet.
Dizful, Persia	about 350 B.C.	1,250	Pointed arches, early type; winding; recently repaired, and central span now modern suspension type.
Düsseldorf, Germany	1898	595	Arch, 6 spans, 2,094 feet.
Florence, Italy (Ponte Vecchio)	1362	105	Covered, wood, 3-span bridge, with jewelers shops on sides, and upper footwalk between.
Florence, Italy (Holy Trinity)	1570	96	Remarkable for beautiful curve and flat arch; made of white marble; total length, 322 feet.
Florianopolis, Brazil	1926	1,114	Chain suspension from isle to mainland.
Forth, Scotland	1890	1,710	Two continuous, equal spans and 2 shore arms; 5,330 in all.
Frankfort, Germany	1869	262	Chain suspension, part cantilever.
Fribourg, Switzerland	1834	870	Four iron wire cables, 2 added in 1880; for many years longest span in Europe.
Garabit, France	1885	541	Highest iron arch in world, 406 feet above water; 5 side spans.
Grand' Mere, Quebec	1929	948	Cable suspension.
Hagwilget, B. C.	1931	460	Longest government suspension to date in British Columbia.
Hawkesbury, Australia	1889	416	Seven equal, independent, fixed spans.
Hamburg, Germany	1909	678	Largest cantilever at time in Germany, over 2 canals, harbor basin, and Rhine, five spans, 2,085 feet.
Ironbridge, England (Coalbrookdale)	1779	100	Single arch, 5 cast-iron ribs, first of this material in England.
Kioto, Japan	very old	250	Two complete circles; vertical curved roadway.
Leithbridge, Canada	1909	5,327	Remarkable viaduct, 314 feet high.
Limerick, Ireland	1827	410	Unusual, 5 circles, segmented.
London Bridge (early)	1209	940	Covered gallery, lined with shops, 20 arches from 9 to 20 feet apart; replaced 1830.
London Bridge, "old."	1831	152	Five arches, 926 feet long; 130,000 people and 30,000 vehicles pass over it daily; widened from 53 to 65 feet in 1904.
London Bridge (new)	1894	200	Side spans suspended by braced chains; steel towers; opening span is in two leaves or bascules.
London, Blackfriars	1768	120	Nine elliptical arches, 995 feet in all; failed by scouring of foundations; replaced by cast iron bridge in 1865.
London, Waterloo	1817	120	Oldest of 14 London bridges now in service; 9 elliptical arches, piers on wooden piles.
London, Westminster	1862	120	Cast and wrought iron, 7 arches; replaced stone-arch bridge of 1750.
Lucerne, Switzerland (Spreuerbrücke)	1871	200	Picturesque, covered wood bridge.

PRINCIPAL FOREIGN BRIDGES—*Continued.*

Location	Date	Length of Total or of Channel Span	Details, Features
Luxemburg, France	1901	277	Largest stone arch when built.
Mannheim, Germany	1890	620	Artistic cantilever, replacing old suspension of 1845.
Menai Straits, Wales	1850	459	Called Britannia Bridge; 2 independent tubular-beam passageways, 4 spans.
Menai Straits, Wales	1826	580	Chain suspension bridge of central span, 2 side spans, and 7 stone arches at ends, 1,710 feet in all.
Miampimi, Mexico	1900	1,030	Cable suspension.
Montrose, Scotland	1931	216	Unusual cantilever of concrete, replacing older suspension bridge.
Narni, Italy	14 A.D.	142	One remaining arch from bridge built by Augustus Caesar; perhaps oldest Roman true bridge work; once 367 feet long.
Neuilly, France	1774	128	Five elliptical stone arches, 766 feet in all.
Newcastle-on-Tyne	1928	531	Largest arched bridge in England to date.
Nimes, France (Pont du Gard)	19 B.C.	885	Aqueduct, 3 stories with 6, 11, and 36 arches respectively; 160 feet high; in 1743 roadway added on one side, still used, but no water flows in top.
Oporto, Portugal (Luiz I)	1885	566	Unusual iron span construction; one roadway 160 feet above a second, which is 44 above water.
Paderno, Italy	1889	492	Single span, parabolic, open web type, 265 feet high, one of highest and longest in world.
Paris, France (Alexander III)	1900	353	Remarkable for width (131 feet), flat rise of arch, and decorations.
Paris, France (Pont Neuf)	1607	775	Oldest of bridges across the Seine; long arm, 7 spans; short arm, 5 spans.
Paris, France (Concord)	1791	102	Very slender piers, 10 feet thick; new section built in 1931 on each side.
Peiping, China	Unknown	100	Camel-back arch, said by some to be most beautiful stone bridge in world.
Peterboro, Ont.	1900	2,620	Pontoon bridge, fixed approach 913 feet; pontoon 2,620; draw 105.
Plauen, Germany	1903	295	Surpassed Luxemburg as longest stone arch in the world.
Prague, Czechoslovakia (Karlsbrucke)	1507	69	Ornamental, 16 arch spans; gate towers at ends; repaired 1895.
Quebec, Canada	1927	1,800	Cantilever; high tension steel used in suspended span; first forms wrecked, 1907 and 1916, during building.
Ratisbon, Germany	1135	53	Fifteen semi-circular arches, 994 feet.
Richmond, England	1774	.....	Most famous classical example of Georgian bridge architecture in England.
Rome, Italy (Pons Sublicius)	140	600	Wood, no nails or iron being used; on piles; ruins removed, 1879, for modern bridge.
Ronda, Spain	17th cent.	280	Viaduct, 460 feet high, with center opening 46 feet wide, and cross arch 230 feet above water.
Segovia, Spain	115	2,500	Aqueduct, 2 stories, 102 feet high; 109 arches built by Emperor Trajan of stone without mortar.
Shuster, Persia	350 B.C.	1,700	Brick, zig-zag bridge, with something like the Gothic arch; fairly well preserved, and said to be oldest bridge still used, next to Dizful.
Smyrna, Turkey	B.C.	40	Single span, pavement and parapets only two centuries old; rest very ancient; caravan bridge.
St. Esprit, France	1309	114	Twenty-six stone arches, 1,700 feet total.
Stockholm, Sweden	1934	585	Concrete arch.
Sukkur, India	1889	820	Cantilever, suspended part, 200 feet; side arms, 310 feet.
Sydney, Australia	1932	1,650	Steel arch, for heavy loads, similar to Kill von Kull bridge, N. Y. N. J. Cost $35,000,000.
Tempoalo, Mexico	1570	58	Small aqueduct, 68 semi-circular arches, 124 feet high.
Tokyo, Japan	1930	300	Suspension of unusual design, Japan-made.
Toulouse, France	1626	737	Foundations on bed rock; 7 arches; commenced in 1542.
Venice, Italy (Rialto)	1591	94	Ornamental bridge, with 24 shops on sides, and passage way between.
Verrugas, Peru	1872	575	First large wrought-iron viaduct over gorge, 256 feet high; once highest bridge in world; replaced by cantilever, 1889.
Villefranche, France	1904	220	Cantilever, with no usual suspended span; 520 feet total.
Viaur, France	1898	721	Steel arch cantilever; 2 side spans; total, 1,509 feet; once second longest in world of type.
Vienna, Austria	1828	334	First use of steel for bridging; replaced by 225-foot span, 1860; and this by iron arch, 1885. The 1860 bridge was first railway suspension in Europe.
Wandipore, Tibet	1650	112	Wood cantilever with wooden pegs and no iron; three roadways.
Wearmouth, England	1796	236	Single iron arch; strengthened, 1859.
Weston, Ont.	1860	650	Plate girders on high masonry piers.
Zambezi, Africa	1935		33 spans, 2 mi. in length. Longest railroad viaduct in world. Cost $10,000,000.

NATIONAL PARKS AND MONUMENTS OF THE UNITED STATES.

The United States possesses more scenery of natural beauty, more diversified and more inspiring than probably any other country. We have mountains of great height and beauty, lakes of vivid color and unknown depths, glaciers pouring out their streams and covering the scarred backs of the mountains with a kind of picturesqueness, canyons of dizzy depths, forests of height, age and verdure not to be found anywhere else in the world and waterfalls of such misty softness that they are not surpassed even by the beauty of the Rhine or the valleys of the Alps. All this and more can be found in the National Parks that have been set aside for public use as the playgrounds of America.

These parks will be given in chronological order of their creation by Congress. **Hot Springs Reservation.** This is located in Middle Arkansas, near the picturesque slopes of the Ozarks and created to preserve the areas of medicinal springs for public use at a nominal cost. It is a health and recreation center of 1½ miles square, set aside by Congress in 1832, and contains some 46 hot springs. Probably the most celebrated and best known of our Parks is the **Yellowstone** in northwestern Wyoming, with an area of 3,348 square miles, created in 1872. It is best known for the geysers (there are more here than in the rest of the world put together). In addition to the geysers there is also a great wild animal reservation and an unrivalled wilderness of scenic beauty.

In 1890 **Yosemite National Park** was created in middle-eastern California with an area of 1,125 square miles and known far and wide for its incomparable waterfalls,—the Yosemite Falls, with two drops of 1,430 feet and 320 feet respectively, Vernal Falls with a drop of 320 feet, Bridal Veil of 620 feet and Nevada Falls of 594 feet—, its huge rocks cut by the glacier, Cathedral rock rising 2,600 feet, El Capitan 3,600 or Half Dome 5,000 feet, and its small glaciers, crystal lakes and everlasting snows.

Sequoia and General Grant National Parks, were both acquired in 1890 for the purpose of preserving our big trees. These parks contain the biggest living thing and the oldest living thing alive in the so-called General Sherman and General Grant trees, the first with a height of 279.9 feet and the other of about the same height, but probably older. The General Grant tree is 3,500 years old, 1,500 years old when Christ was a youth and a sapling when the pyramids of Egypt were being built. The Sequoia Park contains some odd 1,156,000 trees of this kind only on a smaller scale. Four hours from Tacoma to the southeast, we find **Mount Rainier National Park** created in 1899, with an area of 324 square miles. The Park encloses Mount Rainier, an extinct volcano, that towers three miles above the level of the sea and carries on its back 38 glaciers. The glacial flowers that grow in the small valleys, left free by the melting snow and ice, are a sight that no tourist ever fails to thrill over. **Crater Lake,** the lake of mystery, formed by the complete falling into itself of the giant volcano, Mount Mazama, forming one of the most unique phenomena of the world, has been made into a national park, **Crater Lake National Park,** to perpetuate this natural monument for future generations. It was created in 1902, has an area of 249 square miles, and is located in southwest Oregon. In order to preserve the traces of our prehistoric ancestors the **Mesa Verde National Park** was set aside in 1906 in southwestern Colorado, with an area of 77 square miles. Here among the Mesas or isolated plateaus can be found the traces of the old cliff dwellers, their homes, temples, pottery and tools. This makes it a park of special educational and scientific value.

The famous curative springs of southern Oklahoma were preserved for public use with the creation of the **Platt National Park** in 1906 with an area of 1½ square miles. Bought originally from the Indians for the copper industry and then redesignated when no copper was found, this is the history of the **Glacier National Park,** in northwestern Montana close to the Canadian boundary line and known far and wide for its rugged scenery, massive precipices, glacial lakes and many glaciers. We have in one place a triple divide, waters flowing into Hudson Bay, the Gulf of Mexico and the Pacific Ocean. Within this area of 1,534 square miles can be found 60 glaciers advancing down the sides of the mountains.

The Rocky Mountain National Park, a short four hour run north of Denver, was set aside to preserve a part of the Rockies in all their natural beauty without any possible defacement by man. The area is about 358 square miles and is one of the most rugged parts of the mountains.

Mount McKinley National Park was created in 1917 enclosing the great Mount McKinley, the loftiest mountain in America, towering 20,300 feet above the tide, the very climax of the Alaskan range. This area is in the interior of Alaska, but the government is building railroads to make it accessible. It has an area of 2,200 square miles. Two recent creations, are the **Zion National Park** in southwest Utah, an area of 120 square miles, enclosing great colored cliffs and **The Grand Canyon National Park** in northern Arizona, probably the most impressive and awe-inspiring spectacle in this country. Due to the erosion, the Colorado has cut this great gorge—, "like a gigantic statement seemingly too great for even nature to make all in one mighty word." The colors of the rocks and cliffs probably will remain forever indelibly impressed upon the visitor's mind.

Certain parks of lesser importance are the **Hawaii National Park,** containing three volcanoes, Kilauea, Mauna Loa and Mauna Kea, **Lassen Park** in northern California housing the only active volcanoes in the United States, **Wind Cave Park** in the Black Hills of South Dakota, **Casa Granda Ruin** and **Sullys Hill Park** near Devil's Lake, South Dakota.

National monuments are parks on a smaller scale with no appropriation from Congress for maintenance. Among our better known ones are **The Mukutuweap,** canyons of a brilliant hue in southwest Utah, the **Muir Woods** of 300 acres of superb red-woods outside San Francisco,

the **Devil's Tower,** a mass of igneous rock, towering 1,200 feet above the Black Hills of eastern Wyoming, **National Bridges,** five of them in San Juan County, Utah, the **Chaco Canyon** in New Mexico, noted for its Indian relics, **Colorado Monument** of highly colored monoliths, **Lewis and Clark Caverns,** huge limestone caves in Montana, **Rainbow Bridge,** a natural bridge on the Navajo Indian Reservations in southern Utah, the **Papago Saquaro,** tropical desert flora east of Phoenix, the **El Morro Monument,** and an eroded sandstone rock in the shape of a castle, the **Petrified Forests** of Arizona, the **Sitka Monument** one mile from the steamboat dock at Sitka, Alaska, held for historical shrine. **Tumocacori** in Arizona and **Gran Quivira** in New Mexico, both to preserve old Spanish Mission Churches and the **Navajo National Monument,** enclosing three prehistoric puebloes or cliff dwellings. The **Dinosaur** National Monument in Utah containing deposits of fossil animal remains, **Katmai,** in Alaska, including "Valley of Ten Thousand Smokes," **Lehman Caves** in Nevada, **Walnut Canyon** in Arizona and **Wheeler** National Monument in Colorado all have much scientific worth as well as being highly interesting to tourists.

State Parks.

In addition to the national parks and monuments there are over 200 state parks with a total of nearly 180,000 acres. The states having the largest park acreage are as follows: New York leads with 26 parks, having an acreage of 35,500; Minnesota, 12 parks, 35,068 acres; Idaho, has but two parks, is third in amount of acreage with 19,814 acres. On the other hand Pennsylvania has the largest number of parks of any state, being 36 in number, but with an acreage of only 4,381. The other leading states may be mentioned as Michigan with 26 parks, 16,882 acres; Wisconsin with 8 parks, 15,000 acres; Massachusetts with 8 parks, 13,000 acres; and California with 2 parks and 11,400 acres. They are noted either for their historical associations or their scenic beauty.

National Forests.

The ruthless destruction of the forests of the United States with its resulting consequences in floods, and with the rising importance of electro-hydro power and Western irrigation which could only be successfully carried on by conservation of our national forests thereby preserving the source of water supply, led Congress, in 1891, to empower the President to create forest preserves. In accordance with the new law, President Harrison created the Yellowstone Park reserve, the first of our national forests.

The total number is now about one hundred and fifty, with approximately 157 million acres distributed over twenty-nine states. These are equal in area to the following states: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, and West Virginia. They are under control of the forest service of the department of agriculture. Forest conservation was given great publicity and impetus during the Ballinger-Pinchot affair of Taft's administration. The importance of retaining water for electro-hydro power and irrigation has not only stimulated the government to the importance of this question, but private individuals and corporations have taken great interest so that hundreds of thousands of seedlings are now being planted yearly by large corporations.

State Forests.

In addition to the National Forests, there are almost 6,000,000 acres set aside by the various states in forest reservation. New York State leads with a total of nearly two million acres in two reserves; Pennsylvania second, with twenty reserves and nearly one and a quarter million acres; New Hampshire with thirty-five reserves has only sixteen thousand acres; Massachusetts has nineteen reserves and forty-five thousand acres, while Michigan with the same number of reserves has an acreage of 341,611. Other states and their acreage are as follows: Arizona, 31,132; Connecticut, 6,529; Idaho, 685,000; Indiana, 2,700; Louisiana, 6,240; Maryland, 3,550; Montana, 566,000; Minnesota, 381,000; New Jersey, 16,504; New Mexico, 170,000; North Carolina, 300 acres; Ohio, 19,721; South Dakota, 61,440; Vermont, 30,000; Wisconsin, 300,000.

Pennsylvania was one of the original thirteen colonies and was part of the territory granted in the year 1681 to Wm Penn, who colonized it.
Philadelphia was the capitol of the federated colonies during the Revolutionary war, and was the scene of many of the events which made National history.
Area: 45,126 sq. miles.
Pennsylvania has extensive and diversified manufactures and is first in the production of coal and coke, building stone & other minerals.
The state stands high in agriculture, stock-raising and dairying.
Drawn by Selden Irwin

PENNSYLVANIA

WEST VIRGINIA & VIRGINIA

Total Area: 24,170 Sq. Mi. Admitted to U. 1863. Iron and steel mills, pottery, tile and glass ware. Bituminous coal mining, petroleum and natural gas. There are numerous manufacturing establishments throughout the state. Farming & sheep raising is carried on. Lumber, especially the hard woods, is produced.

Total Area 42,627 Sq. Miles. Ratified U.S. Constitution 1788. Coal, iron, copper, gypsum, zinc and manganese are the principal minerals. Agriculture is carried on in all parts of the state. Corn, wheat, tobacco and peanuts are grown and the cultivation of apples has become a large industry. Fish and oysters are marketed. Ship yards at Norfolk and Newport News.

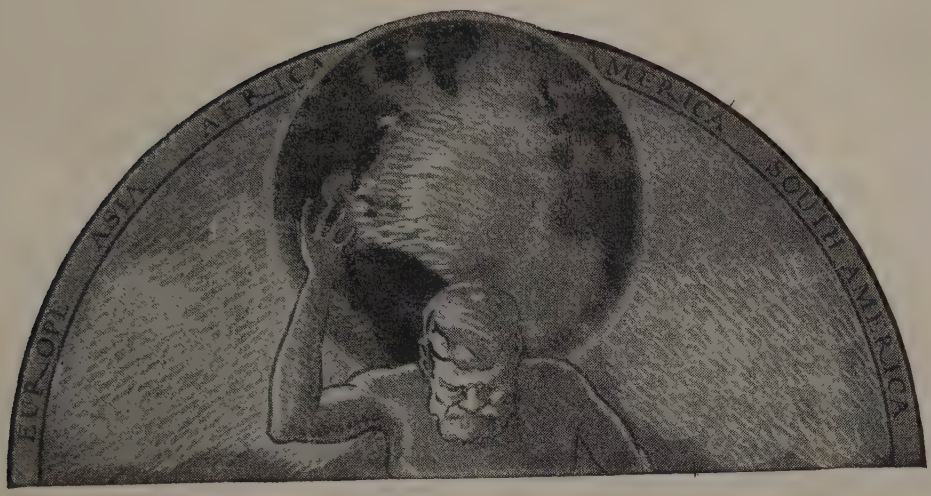
BOOK VI.

ATLAS.



Drawing by SELDEN IRWIN.

MAP OF WORLD, COUNTRIES OF EUROPE, ISLANDS OF NORTH SEA, BRITISH ISLES, AFRICA, ASIA, AUSTRALIA, NEW ZEALAND, SOUTH AMERICA, NORTH AMERICA, CENTRAL AMERICA, UNITED STATES, CANADA AND NORTHWEST TERRITORY, WEST INDIES, HAWAII, PHILIPPINES.

Atlas, a Greek mythological term. Homer represents him as "one who knows the depths of the whole sea, and keeps the tall pillars which hold heaven and earth asunder." Finally Atlas was explained as the name of a primitive astronomer, who was said to have made the first celestial globe. A figure of Atlas supporting the heavens, is often used as a frontispiece in map collections. It is said to have been first used in this way by Mercator. The name applies—first, to a volume of maps, secondly, to any volume containing a tabulated treatment of a subject.

Maps. A representation on a plane, and in reduced scale of a part, or whole of the earth's surface. If it is designed for use of seamen it is called a Chart. The words map and chart are derived from mappa and charta, the former being the Latin for a napkin or cloth, the latter a parchment or papyrus. Maps are frequently named after the material upon which they were drawn or painted. Today maps for military use are frequently printed on cloth.

A collection of maps, is called an Atlas, named after the mythological Atlas, supporting the heavens.

Maps may be divided in different classes according to their use. Physical, which include geological, hydrographical, etc. Political, showing boundaries of states. Ethnological, illustrating distribution of races of mankind. Statistical, illustrating commerce and statistics. Travel maps, highways, railroads, aviation, ocean routes. Historical maps, as showing growth of United States. Educational, designed for reference and general school purposes.

The most ancient known map is one sketched on a clay tablet discovered in Babylon, and is believed to date from the 8th century B. C. It shows the earth as flat, circular in form, surrounded by a river, which the Greeks believed to be an ocean.

The authors of "The New Century Book of Facts," realizing the vital importance of maps in the study of Geography have placed this department adjacent, in order that they may be used together. It is not sufficient merely to know that a certain city is located in the state of New York or Texas, or that a certain state is west of the Mississippi river, or a particular railroad connects two cities; it is important to know the exact geographical location, the exact country traversed by this railroad, and the reasons for the growth of these cities.

Modern mechanics has become so highly developed, that long hours of toil are gradually lessening. People have more time for study and travel. This together with the ever increasing speed of the transportation world, makes it pos-

sible that places and things which were only within the reach of the more wealthy are now at the door of every automobile owner. People have become educated to the value of travel not only through the motor, but also the increasing advertisements of cheap excursions by the railroads. All this means that to better appreciate their travel, these excursions, use must be made of an Atlas. The New Century Atlas, is most up to date, the best that is to be offered.

---

1. Aims of the Kindergarten. The Kindergarten through its various activities strives to aid in the development of the child from four to six years of age. The child has exhausted the unorganized activities of the home at the age of four, and is ready for the organized play of a group of his own age. And for this period, the Kindergarten was designed. It provides the child with a systematized plan of play and work which is based upon those experiences of the home with which he is most familiar. It provides more—as its functions carry him out beyond the home into the activities of the neighborhood and community of which he now becomes an important member.

At this age the child manifests an interest in all the activities about him, as is shown by his play. He imitates; he delights in little rhymes and Mother Goose jingles; he names everything and asks innumerable questions about the things he hears and sees; he is never quiet but is constantly exercising his own physical activities and is thus gaining control of his own body. This is the period when the interests of children can be more permanently formed and the Kindergarten provides them with the right sort of materials to work with and gives them organized exercises for their physical and mental development. It helps them to grow more kindly, unselfish, and courteous, and to gain right habits of work and play—all essentials in the development of *worth while* ladies and gentlemen.

2. Relation to First Grade. The Kindergarten provides the first step from the home and mother to the more formal program of the grades in school. Therefore it should combine a homelike atmosphere with the systematized and entertaining routine of school. Application and concentration should be put before the child in such ways that they become a part of his being —valuable assets to his later school career. Stress should be laid on fair play and consideration of others' rights. The many games and the various gift-materials provide the means to this end.

3. Method. When the child enters the Kindergarten, it is usually the first step away from Mother—the first step out into the world by himself. The Kindergarten aims to give him then as much of the home atmosphere as possible. The room should be made attractive with many

interesting pictures, a piano, a sand table, and upon the tables he should have for his enjoyment many things to play with.

After a play by himself, he will be glad to enter into play with others such as sitting upon the circle and rolling the balls back and forth. As he becomes better acquainted, he will pick out certain ones to whom he will roll the ball and this aids in mastering the different names. After the children have played with the balls, they have overcome much of their shyness and so other simple group games can be introduced. Avoid any game at the beginning in which a child must perform an act that would make him at all conspicuous as the self consciousness that comes over him will sometimes stay with him for several weeks.

Marching should be the first rhythm and with a good martial air played upon the piano, they soon fall into the spirit. At the beginning, care and patience will be needed to guide the little ones to follow in line. From the march they are shown how to carry their chairs back and forth from the tables.

It will take several days to learn to carry the chairs properly, to march fairly well, to sing the Greeting, or Good Morning song, and in general to feel at home. Then they are ready to gather together around the circle for a little talk, which will from now on form a part of the daily program. These talks are about some experience, a toy, a picture, or a story about some topic in which all are interested. The talks are followed by some related activities, such as building a bird's nest from clay about which some child has told.

The topics chosen must not only appeal to the child's interest but be instructive as well. They should be concerning the community life about him, the world of nature, geographical studies and people whose lives are so different from ours.

The songs and games make the day more happy and pleasant. These are sometimes related to the topics on hand and again they just appeal to the child's emotional nature. In the songs, the words should be learned before the melody is attempted. Care should be taken to choose songs that are simple and whose pitch is neither very high nor low. Soft and sweet tones should always be used—no child should be allowed to sing to the full capacity of his or her voice for fear of a strain which would impair the quality of the voice for singing in later years. "Quality and not quantity" should always be the motto to follow. Different songs and games should be put "on the shelf" every now and then and left for a month or so. Then the children delight in taking them down, blowing off the dust, and singing and playing them all over again.

The manual activities increase in difficulty as the time goes on and one should notice considerable progress after a few weeks' work. In the gift work, there is a good chance to instill unselfishness. The average child upon entering Kindergarten wants his material all to himself but later on with careful guidance, he will be glad to give from his portion if it will help another to complete his picture.

The rhythms and calisthenic exercises relax the muscles and should be put in often through the program. After steady work at the tables, to have the children stand and imitate riding a bicycle for a few seconds, etc., will cause them to return to their work with new energy. These exercises also follow the child's natural inclination to live in the land of "make believe." Besides these little exercises to relax the muscles, a make believe nap gives a rest to the eyes as well as the body. The teacher should croon a soft lullaby which can be followed by the representation of a "dream fairy," bringing a tiny dream to each one. Upon the sound of the bugle, every one awakes and has a turn to let their imagination play in telling the dream that was brought to them.

4. Games.

(a) BALL GAME, to teach direction, likewise co-operation with a large group. This is a circle game and is played by calling a name and rolling the ball to the person called. If he misses, he is out of the game.

(b) KNIGHT GAME, to teach civic ideals through play, and to introduce the physical exercise of galloping horses.

(c) SENSE GAMES, to increase the keenness of perception. These are many and varied —such as—*A table full* of objects is displayed and after a short survey, covered over and child is asked to tell all he observed. *The Lost Child* also aids in sight development. One child is sent from the room and another one is hidden. The rest change chairs and the child, returning, discovers the lost child. *The Hen and Chicks* game develops the sense of hearing. The hen is chosen to leave the room. In her absence several children are selected for the chicks. When the hen returns, all the children cover their mouths and when the hen clucks, the selected chicks answer "peep" and the correct ones are to be located. *Where's My Kitty?* is on this order. One child is sent out and one is chosen to be the kitty. The child returns and asks, "where's my kitty?" and the kitty answers, "Meow." *"Who Am I?"* develops the sense of touch. A child is blindfolded, another goes up to him and says, "Who am I?" The first child feels him all over and tries to tell who it is.

(d) MY LADY IS GOING ON A JOURNEY GAME, to develop the memory. One is chosen to stand in the center of the circle for the lady's maid. Each child is given the name of some article that a lady would take on a trip. As the maid names these various articles, the one bearing the name stands and turns about and sits down. Upon the mention of TRUNK, all get up and change chairs and endeavor to secure a chair and not be "it," there being one less chair than players.

(e) MUSICAL CHAIR, to teach alertness. Chairs are placed in a row, there being one less chair than players. As the music starts, all march around the chairs. When the music stops, each endeavors to get a chair. The child who does not, must take his chair out, and so on until there is but one remaining.

(f) FINDING THE CHALK, a sense of hearing game. One child is chosen to leave the room while a piece of chalk is hidden. Upon his return, he is to find this chalk with the aid of

music. Loud music tells him he is "hot" and soft music that he is "cold."

(g) THE FARMER AND THE CHICKENS, for a running exercise. A chicken house is built—a circle of chairs with space for a door. One is chosen for the farmer and one for the timekeeper. The rest are chickens who roam around about the chicken house as the time keeper calls different hours of the day. When "midnight" is called the chickens aim to get in the door before the farmer can catch them. Any caught are out of the game.

(h) PINNING THE COLORED PAPERS ON THE BACKS. Two children are chosen and upon each back is pinned a bright colored paper. Each one tries to see the other's paper and at the same time keep his own paper out of sight. This provides active exercise and teaches concentration.

(i) CHALK GAME, to develop the will. Several children are sent from the room while a piece of chalk is hidden. Upon their return they hunt the chalk and upon discovering it, they steal to their chairs and in no other way do they signify that they have found it and thus do not acquaint the others of its whereabouts.

A Kindergarten Class.

(j) WHEELBARROW RACE, an exercise game. Boys take hold of the feet of other boys and hold them as they would the handles of a wheelbarrow; the wheelbarrows then run on their hands to a line marked off on the floor and return to the starting point. See who wins the race.

(k) RUTH AND JACOB. One player is blindfolded, the rest dance in a circle round him till he points at one of them. This person then enters the ring, and when the blindman calls out "Ruth," answers "Jacob," and moves about within the circle so as to avoid being caught by the blindman, and continues to answer "Jacob" as often as the blindman calls out "Ruth." This continues until Ruth is caught. Jacob must then guess who it is that he has caught; if he guesses correctly, Ruth takes his place, and the game goes on; if he guesses wrongly, he continues to be Jacob.

(l) SIMON SAYS, a good concentration game. They seat themselves in a circle and choose one of the company to be Simon. His duty is to order all sorts of different things to be done, the funnier the better, which must be obeyed only when the order begins with "Simon says." As, for instance, "Simon says: 'Thumbs up!'" which, of course, all obey; then perhaps comes "Thumbs down!" which should not be obeyed, because the order did not commence with "Simon says." Each time this rule is forgotten, the child forgetting is out of the game.

(m) BRONCHO GAME, a very active exercise. Three people form the broncho, one the head, the second the body, and the third the tail. Several such bronchos are formed at different places in the room. One child is chosen as a rider and one as a chaser. In order not to be caught, the rider can "jump" on one of these bronchos and he thus becomes the tail and the head becomes the rider and the chaser pursues him. If caught, he becomes the chaser.

(n) FLY AWAY, another good concentration

game. The children are seated with their hands in their laps. When "It" says, at the same time raising his hands, "Fly away, mosquito," or "Fly away, bat," or "Fly away," followed by the name of any other animal that flies, the rest of the players are to fly their hands. When he says, "fly away," followed by the name of an animal that does not fly, the players are not to raise their hands, although the leader flies his. Any one making a miss either by not raising the hands at the right time or by flying the hands at the wrong time becomes "It." Or they can be out of the game and the winner is the one who remains after all the rest are out.

(o) SKIP TAG, a great favorite with little children. A circle is made and one chosen "It." He skips around the circle and tags one to chase him. When caught, the child tagged becomes "It" and repeats the performance until all have played.

(P) AUTOMOBILE GAME, an imagination game. The children sit around in a circle and one stands in the center and begins a make believe story of an automobile ride. All at once in the procedure of the story, he tells how the car ran over a piece of glass or a nail, etc., and a "tire burst" at which all get up and change chairs. The one who misses a chair makes up the next story of an auto ride.

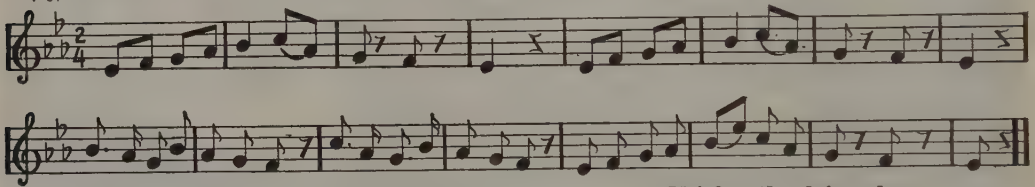
(Q) MODES OF TRAVEL, to increase inventiveness. The players are ranged at one end of the room and numbered from one up. When a player's number is called he crosses the room to the other goal in any way he may choose. No player can employ the same mode of travel as any preceding player. After all have crossed the floor the teacher decides which one travelled in the most unique or interesting way. A variation may be to choose a destination, such as Atlantic City or any place familiar to the children.

(R) FOLLOW THE LEADER, another game to develop the ingenuity of the child. A leader is chosen who takes his place at the head of a line of players. He walks about, at the same time going through various motions. The rest of the players must follow him and imitate all his actions.

Two lines may be formed and a contest take place as to which gives the better exhibition.

A. SINGING GAMES.

(A) RABBIT IN THE HOLLOW. One child crouches in the center of the ring while the hunter roams without. The children in the ring chant the song. When they come to "run, run, run," the hunter from without breaks through while the rabbit escapes and is pursued. If caught he becomes the hunter while another child is chosen for the rabbit.



(B) THE FARMER IN THE DELL. One player stands in the center, surrounded by children who, with hands joined, circle about and sing the verses below. At the conclusion of the second verse, the child within the circle chooses one of the circle players to stand beside him. At the end of each of the succeeding verses, the last one chosen, chooses another child to come within the circle. When the last verse has been sung, all the players jump up and down and clap their hands.

The verses:

1.
The farmer in the dell,
The farmer in the dell,
Heigh-o the dairy oh,
The farmer in the dell.

2.
The farmer takes a wife,
The farmer takes a wife,
Heigh-o the dairy oh,
The farmer takes a wife.

3.
The wife takes a child,
The wife takes a child,
Heigh-o the dairy oh,
The wife takes a child.

In like manner are sung:

4.
The child takes a nurse, etc.

5.
The nurse takes a dog, etc.

6.
The dog takes a cat, etc.

7.
The cat takes a rat, etc.

8.
The rat takes the cheese, etc.

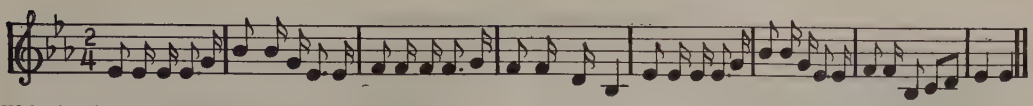
9.
The cheese stands alone, etc.

(C) THE MULBERRY BUSH.

Here we go round the mulberry bush,
The mulberry bush, the mulberry bush.
Here we go round the mulberry bush,
So early in the morning.

This is the way we wash our clothes,
We wash our clothes, we wash our clothes,
This is the way we wash our clothes,
So early in the morning.

Chorus—(Here we go round the, etc.)



This is the way we iron our clothes,
We iron our clothes, we iron our clothes,
This is the way we iron our clothes,
So early Tuesday morning.
Chorus—(Here we go round the, etc.)

This is the way we scrub the floor, etc.
(Wednesday morning.)
Chorus—

This is the way we mend our clothes, etc.
(Thursday morning.)
Chorus—

This is the way we sweep the house, etc.
(Friday morning.)
Chorus—

This is the way we bake our bread, etc.
(Saturday morning.)
Chorus—

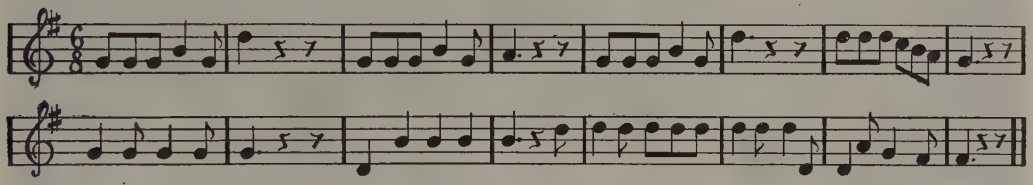
This is the way we go to church, etc.
(Sunday morning.)
Chorus—

(D) CHARLEY OVER THE WATER. One of the players, Charley, stands in the center, the others with hands joined, circle about him, singing—in a chant

Charley over the water,
Charley over the sea;
Charley caught a blackbird,
But he can't catch me.

The players stoop just as the last word is said and should Charley tag any player before he stoops they exchange places.

(E) LOOBY LOO. All join hands in a circle and dance one way as they sing, "Here we dance Looby Loo," and dance back as they sing, "Here we dance Looby Light." This is repeated and then the motions of the song are taken as sung.



Here we dance looby loo,
Here we dance looby light,
Here we dance looby loo,
All on a Saturday night.

Put your right hand in,
Put your right hand out,
Then give your right hand a shake, shake, shake,
And turn yourself about.
Chorus—
Here we dance looby loo, etc.

Put your left hand in,
Put your left hand out,
Then give your left hand a shake, shake, shake,
And turn yourself about.
Chorus—
Put your right foot in, etc.
Chorus—
Put your left foot in, etc.
Chorus—
Put your whole selves in, etc.
Chorus—

(G) ROUND AND ROUND THE VILLAGE.

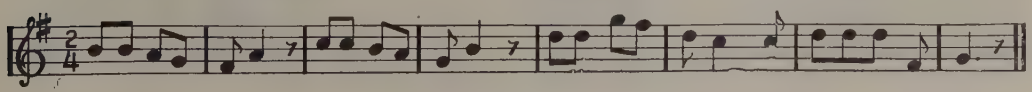
1.
Round and round the village,
Round and round the village,
Round and round the village,
As fast as we can go.

2.
In and out the windows,
In and out the windows,
In and out the windows,
As we have done before.

3.
Follow me to London,
Follow me to London,
Follow me to London,
As we have done before.

4.
Stand and face your partner,
Stand and face your partner,
Stand and face your partner,
And bow before we go.

Directions—The children form a circle with one player standing outside. For the first verse the child dances around the outside of the circle. At the second verse, the child passes in under one pair of arms and out under another and so winds in and out. For the third verse, he remains in the center and chooses one to follow him around the circle. For the last verse, they stand and face each other and bow and part.



B. SINGING EXERCISES.

(A) DUSTY BOB.
(B) ON OUR TIPTOES.
(C) FORMATION GAME.
(D) WE'LL ALL GO A-WALKING.
(E) RIDE A MILE.
(F) ALL SIZES.
(G) THE LAMPLIGHTER.
(H) SOLDIER BOY.
(I) THE TRAIN.
(J) THE STREET CAR RIDE.

These exercises are to be found in Old Tunes, New Rimes and Games by Mari Hofer and published by A. Flanagan Co., Chicago.

C. CONTEST GAMES.

(a) Ring Toss.
(b) White House Egg Rolling Game.
(c) Ten Pins.
(d) Putting the Ring on Sambo's Pipe.
(e) Rubber Horseshoe Game.

5. Stories.

The story is the beginning of literature and should be of such nature as to create a love for good reading. Good stories can be repeated many times. Fairy tales are great favorites but care should be exercised to choose the ones in which the gruesome element is lacking. The children love these repeated again and again. Reproduction by the children can be added and then dramatization of the more simple ones. The latter aids materially in giving the child poise as well as developing fluency of speech. In this work let the child use his own ideas as to what materials should be used and how. This helps the imagination of the child. Care should be taken to guide him in the use of correct grammar and at the same time try not to make him self conscious. When a grammatical error is made, it is well to repeat the correct form immediately after.

Longer stories should be read rather than told to the children so as to let them give their undivided attention to the story. Even simple books can be added to the list of which only a part is read each day. This is excellent work for the memory as the previous day's reading is reviewed in short. The Thornton Burgess Books are illustrations of good books to read as these are very instructive in the lives and habits of animals and are written in a very interesting manner. The Lucy Fitch Perkins' Twin Books also furnish good material for children of Kindergarten age. These books give geographical knowledge which is authentic. The Johnny Gruelle Books supply the aesthetic element.

The following are good for telling, reproducing, and dramatizing.

THE FOX AND THE GRAPES.

A fox was very fond of grapes. One day after he had been running all day and was exceedingly thirsty, he came to a garden where he saw bunches of beautiful, sweet, ripe grapes hanging from a vine which had grown high up over a trellis. His mouth began to water and he wanted those grapes. He tried to jump up to catch them with his mouth but they were too high. Again and again he jumped but with no better success. He simply could not reach them. At last he had to give up and as he turned away, disappointed, he tried to comfort himself by saying: "Well, those grapes are sour, anyway."

Aesop.

THE ELVES AND THE SHOEMAKER.

Once upon a time there was a shoemaker who was a good man and who worked very hard but still he was poor. One day he found that things had gone from bad to worse and that he had only one piece of leather and no money to buy more. He cut a pair of shoes out of the leather and laid them on the bench as it was late and time for him to go to bed.

"It is late, my wife," he said, "I will not do more to-night but will get up early in the morning and make the shoes."

But the next morning when the shoemaker went to his bench, there were the shoes all made. Every stitch was in the right place. "Who could have done the work?"

Soon a man came in to buy a pair of shoes. These pleased him so much that he gave the poor shoemaker a good price for them. This enabled the shoemaker to buy enough leather for two pairs of shoes. That night he cut them out and laid them on the bench and when the morning came again he found the two pairs all made.

Two men came in that day. "These are fine shoes," they said; and they paid a big price for them.

This time the shoemaker bought leather enough for four pairs of shoes. Once more he cut them out and laid them on the bench and once more the following morning he found the shoes completed.

So it went on. Each night he cut out the leather and each morning he found the shoes all made and made very well with every stitch in the right place. Each day he sold them for a good price and bought more leather. At last he became rich.

One night just before Christmas, he said to his wife, "Let us sit up to-night and see who has been so good to us." So they hid behind the door.

At midnight in came two little elves, skipping and jumping. They ran to the bench, hopped upon it, and set to work. How fast their needles and their hammers flew. They worked until all the shoes were made. Then they placed them on the bench and with a hop and a skip, away they ran.

The next morning the shoemaker's wife said, "These little elves have made us rich and now we must do something for them. Let us make them some new clothes as the ones that they were wearing looked pretty thin and old for this cold weather. I will make them warm coats and trousers and you can make them some shoes."

So the shoemaker made two little pairs of shoes and his good wife made two little red coats and two little blue trousers. That night they laid them on the bench and again hid behind the door to see what would happen.

At midnight, in came the two little elves with a skip and a jump. They got upon the bench and looked around for the leather but they saw none. In its place they saw the suits of clothes. They were delighted and could hardly wait to get into them. Then they danced for joy.

They jumped from the table and ran out the door. No one ever saw them again but the shoemaker and his wife were always happy at their work and were never poor again.

THE ELVES AND THE SHOEMAKER.

THE LITTLE SNOW-GIRL.

Once there was a little boy and a little girl who lived with their father and mother. These two little children had names just like flowers —the little girl being called Violet and the boy, Peony.

One winter day the snow began to fall and it snowed and snowed until the ground was covered. The children stood at the window and watched the snow awhile and then said, "Oh, Mother, may we go and play in the snow?" The mother was busy sewing but she looked up and said they could go but that they must wrap up warm. So the children put on their coats, hats, mittens and galoshes and out they ran to play in the snow. They had a fine time, throwing snow at one another and rolling the snow into balls for a snow-man. Then Violet said, "Oh, Peony, wouldn't it be fun to make a snow-girl?" So they did. They made such a pretty little girl with a snow coat, snow hat, snow mittens, and snow rubbers, and then Violet said to Peony, "Wouldn't it be fun, Peony, if this little girl could play with us?" And do you know that just as Violet finished speaking, this little snow-girl opened her eyes, stepped off the snow, and began to play with the children. My! what a good time they all had. They ran races and played tag. Soon they called to their mother, "See, Mother, what a nice snow-girl we made." Mother looked up from her sewing and smiled—she thought it was one of the neighbor children.

So they played all afternoon until the sun went down. Father came home for supper and he called for the children to come in. But the children answered that they could not go in without the little snow-girl. "Little snow-girl," said Father, "Nonsense, who ever heard of a snow-girl? Where is she?" "Oh," said Violet, "We did make one and she played with us all the afternoon. Then when you came home she ran away down behind the bushes in the garden." "I must go down and see her," said Father. Sure enough, there was the little snow-girl but Father thought it was a neighbor's child too. "Come in and get something warm to eat, little girl," said Father. "And then we will take you home." At first the little girl hung back as she knew what would happen when she got in by the fire but Father took her by the hand and led her into the house. In the living room there was a fine big fire blazing away in the grate, with Violet standing on one side and Peony on the other. Father placed the little snow-girl between them and then went out to get her something warm to eat. When he came back, there stood Violet and Peony as he had left them but between them was a little heap of melted snow on the carpet.

Hawthorne's Wonder Book (Adapted)

THE LITTLE RABBIT.

There was once a little rabbit who built himself a house. Pretty soon there was a knock at the door and a voice said, "Little Rabbit, let me come in. I am so cold." The little rabbit said, "Yes, do come in and get warm." And he opened the door and in came a fox. After he was seated, he said to the rabbit, "Little rabbit, this house is too small for two. You go out and I shall live here now."

Little rabbit felt very badly at being driven from his home and he began to cry as he roamed about. Soon he met a bear who said, "Little Rabbit, why do you cry?" "I cry because the fox came into my house and drove me out," replied the rabbit. "Well, we will see about that," said the bear and together they went to the rabbit's house. In a deep rough voice, the bear called out, "Come out of there, Mr. Fox." But Mr. Fox said, "If I do, I'll eat you up." This frightened the bear and he said he couldn't stay for that and away he ran.

Little rabbit continued on his way and soon he met a wolf. He said to the rabbit when he noticed the tears, "Why do you cry?" "I let the fox in to get warm and he drove me out of my house," said the rabbit. "We shall see about that," said the wolf and they went to the rabbit's house. In a loud voice the wolf shouted, "Come out of there, Fox." But the fox replied that if he did he would eat the wolf up and Mr. Wolf decided he would not stay for that and away he ran.

Next little rabbit met a white rooster who asked him why he cried. The rabbit said, "I cry because the fox has my house and will not let me stay in." "Well, we'll see about that," said the rooster and very bravely he walked back to the rabbit's house. When he reached there he called, "Come out of there, Fox." But the Fox said, "If I do, I'll eat you up." "I have a gun that shoots on the spot. The fox had better run or he'll get shot," said the rooster and out ran the fox and away as fast as he could go without once looking to see who had driven him out. The little rabbit was very grateful to the rooster and thanked him for getting his house back.

THE STORY OF PETER RABBIT.

Flopsy, Mopsy, Cottontail, and Peter lived with their mother in a sand bank at the foot of a fir tree.

One day Mrs. Rabbit called the children to her and said, "Children, I must go to the store and I will tell you what you can do while I am away. You may play in the field where the blackberries grow but you mustn't go near Mr. McGregor's garden. I shall bring you something pretty nice if you are good and do as you are told. Now run along."

"We will be good, mother," they cried and off they went.

Flopsy, Mopsy, and Cottontail were good little rabbits and did as they were told but naughty little Peter, What do you suppose he did? He ran straight to Mr. McGregor's garden and squeezed under the gate and was soon eating his fill of nice tender lettuce.

When he had eaten all the lettuce he wanted, he started for the parsleybed; but just as he rounded the corner, he had a great fright. There

was Mr. MacGregor planting cabbages. Peter was so frightened that he forgot where the gate was but he started to run.

Mr. MacGregor picked up his rake and ran after him, calling, "Stop, thief! Stop, thief!" This frightened Peter more than ever. His shoe came off but he did not have time to find it. And then! What do you think? He fell into a net and there he was, caught fast, and Mr. MacGregor very close to him. It was the button of his coat that had caught in the net and pretty soon a thought came to Peter. What do you think he did? He slipped out of his coat, left it in the net, and ran like the wind.

He made for the tool house and there he saw a watering can. In he jumped but Oh, Oh! Peter had jumped into a can of water. It was cold and wet, but there he had to stay as Mr. MacGregor had come into the tool house. I don't believe he would have ever thought of looking in the watering can if Peter had not sneezed. "Kerchoo!" went Peter. Mr. MacGregor was after him in a minute. Out of the window dashed Peter, upsetting three plants. The window was too small for Mr. MacGregor, and he was tired of running after Peter. He went back to his work.

Peter sat down to rest; he was out of breath and trembling with fright, and he had not the least idea which way to go. After a time he began to wander around, going lippity-lippity-not very fast, and looking all around.

He found a door in a wall but it was locked and there was no room for a fat little rabbit to squeeze underneath.

An old mouse was running in and out over the stone doorstep, carrying peas and beans to her family in the wood. Peter asked her the way to the gate but she had such a large pea in her mouth that she could not answer. She only shook her head at him. Peter began to cry.

Then he tried to find his way straight across the garden, but he became more and more puzzled. Presently he came to a pond where Mr. MacGregor filled his watering cans. A white cat was staring at some goldfish; she sat very, very still, but now and then the end of her tail would twitch as if it were alive. Peter thought it best to go away without speaking to her. He had heard about cats from his cousin, Little Benjamin Bunny.

He went back towards the tool shed but suddenly quite close to him, he heard the scritch-scr-r-atch of a hoe. Peter scampered under some bushes but presently, as nothing happened, he came out and climbed upon a wheelbarrow and looked around. The first thing that he saw was Mr. MacGregor, hoeing onions. His back was turned towards Peter and just beyond him was the gate.

Peter got down very quietly and started running as fast as he could go. Mr. MacGregor caught sight of him but Peter did not care. He kept on going and soon slipped under the gate and was safe at last in the wood outside the garden.

Mr. MacGregor hung up the little jacket and the shoes for a scarecrow to frighten the blackbirds.

Peter never stopped running until he reached the fir tree. He was so tired that he flopped down on the nice soft sand and closed his eyes. He was soon fast asleep.

His mother was busy cooking. She wondered what he had done with his clothes. It was the second little jacket and pair of shoes that Peter had lost in a fortnight.

I am sorry to say that Peter was not very well during the evening. His mother put him to bed without any supper and made him some camomile tea. But Flopsy, Mopsy, and Cotton-tail had bread and milk and blackberries for their supper.

Beatrix Potter.

THE PIED PIPER OF HAMELIN.

Many years ago in Germany in the town of Hamelin there were rats, rats, rats. The town was very pretty. There were trees along the streets and not far away was a beautiful river. But all the beauty of the town was spoiled by so many rats. They were in the streets and in the houses. They were into everything and the people had no peace. At last they went to the Mayor and told him that he must get rid of the rats. The Mayor did not know of any way to rid the town of the rats. He thought and thought but no plan suggested itself.

Just then there was a tap at the door and the Mayor called, "Come in." And in did come a stranger. He was a very queer looking fellow as half of his coat was yellow and half was red. He himself was tall and thin and each blue eye was sharp like a pin. Around his neck was hung a flute.

"Good Day," said the stranger. "I hear you are troubled with rats in this town. Would you like to be rid of them?"

"Indeed we would," replied the Mayor. "But who are you and how do I know that you can rid the town of rats?"

"I am the Pied Piper," said he. "I can play on my flute, music that will charm all things under the sun. In Italy the King's palace was overrun with mice and when I played on my flute, they all followed me away. Will you give me a thousand guilders to take all the rats away from here?"

"Agreed," said the Mayor.

The Piper went out into the street and put his flute up to his mouth. Up one street and down another he went, playing a weird tune. Soon a strange thing happened. Tiny squeaks began to be heard and they grew louder and louder and out of the houses the rats came tumbling; all kinds of rats—little rats, big rats, lean rats, fat rats, brown rats, black rats, white rats, gray rats. Every rat in the town followed him as he played his music. He led them on until he came to the river and in their effort to get nearer to the wonderful music they did not see where they were going and into the river they all went and every one was drowned.

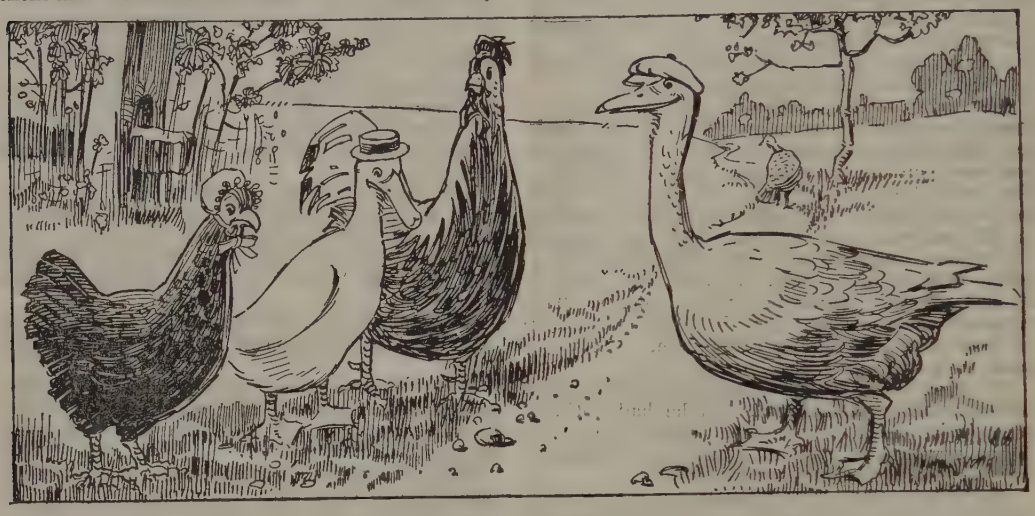
The Piper returned to the Mayor for the thousand guilders but the Mayor said, "Surely, you know that I was only joking."

"But I was not joking," said the Piper. "Will you give me the money or not?"

Still the Mayor refused and in parting the Piper said, "You'll be sorry for I have another

tune to play for people who do not keep their word."

He went into the street once more and began to play on the flute. This time the music was rollicking and soon out of the houses the children came running. They danced and sang and followed the Piper wherever he went. It seemed that they could not help themselves. He led them around the streets and then led them away from the town. The parents called and called but they heeded them not. The Piper led them to a mountain and when they reached it a door in the side of the mountain opened and in went the Piper and all the children and that was the last the people of Hamelin ever saw of the Piper or the children. And oh, how lonesome it was in the town with all the children gone.



HENNY PENNY.

Henny Penny was a little black hen that lived at Farmer Brown's. One day she was in the garden scratching around under an oak tree. Something fell out of the tree onto her head and she flew out of the garden in haste.

"I must tell the King that the world is coming to an end," said Henny Penny and that is what she thought for whatever had fallen from the oak tree, to her was a piece of the sky.

Soon she met a rooster who asked her where she was going.

"I am going to tell the King that the world is coming to an end as a piece of the sky fell on my head today," said Henny Penny.

"I will go with you," said Cocky Locky—for that was the rooster's name. So the two hurried on.

Soon they met a duck by the name of Ducky Lucky.

"Where are you going, Cocky Locky?" asked the duck.

"We are going to tell the King that the world is coming to an end," said the rooster.

"Who told you that?" said the duck.

"Henny Penny told me and she knows for a piece of the sky fell on her head today," replied the rooster.

"I'll go with you," said the duck and the three started off.

Soon they met a goose who asked them where they were going.

The duck said, "We are going to tell the King that the world is coming to an end."

"How do you know that?" asked the goose.

"Cocky Locky told me and Henny Penny told him. Henny Penny knows as a piece of the sky fell on her head this day," said the duck to Goosey Poosey, for that was the Goose's name.

"I'll go with you, if I may," said the goose and he joined the party of three and they set off together to the King's palace.

As they travelled on they met Turkey Lurkey, a nice fat turkey who said to them, "Where are you going?"

"We are going to tell the King that the world is coming to an end," said the goose.

"How do you know that?" asked the turkey.

"Ducky Lucky told me and Cocky Locky told him and Henny Penny told Cocky Locky. Henny Penny knows as a piece of the sky fell on her head today," said the goose.

"I'll go with you," said the turkey.

A little farther on they met a fox by the name of Foxy Loxy who asked them where they were going.

"We are going to tell the King that the world is coming to an end," said Turkey Lurkey.

"How do you come to know that?" asked the fox.

"Goosey Poosey told me, Ducky Lucky told her, Cocky Locky told Ducky Lucky and Henny Penny told Cocky Locky. Henny Penny knows as a piece of the sky fell on her head today," said Turkey Lurkey.

"Come with me to my house and I will give you a lunch and then we will all go to the King's palace," said the fox.

They were all glad to go as their long walk had made them hungry. The fox led them into his house but they never came out again. It was the fox who had the lunch, or rather it was a dinner as a hen, a rooster, a duck, a goose, and a turkey made a full sized meal.

THE THREE KITTENS.

There were three kittens, one gray, one black, and one white, who lived with their mother in a small house at the edge of town. One day their mother said, "Children, I am going to market to buy you some rolls. You must be good while I am away and do not answer the door if there should be a knock as it may be the wolf." "We will be good," said all the kittens. So off the mother started.

She had not been gone long when there was a knock at the door and a voice called, "Open the door, my children. Here is your mother and she has food for you." But the gray kitten said, "Oh, no, you are not our mother. Our mother's voice is soft and sweet and your voice is harsh, You are the wolf, so be off with you." The wolf ran to the grocery store and bought some fairy chalk which he ate to make his voice sweet. Then he ran back to the kittens' house and knocked on the door again. And in a sweet voice he called out, "Children, let me in. I am your mother and I have food for you." Yes the voice was sweet just like their mother's but little white kitten peeped through the keyhole and saw that the feet were black so he said, "Oh, no, you are not our mother as your feet are black and our mother's feet are white. You are the wolf, so be off with you."

The wolf ran to the baker's and ordered the man to wrap his feet in dough. This done, he ran back to the kitten's house and once again knocked at the door and in a sweet voice said, "Open the door, my children, for your mother. She has food for you." The voice was sweet as their mother's and white kitten looked through the keyhole and saw that the feet were white like their mother's so he opened the door and in bounced the wolf. The three kittens ran in all directions to hide. Gray kitten jumped upon a shelf; white kitten hid under the tub in the kitchen, and black kitten jumped into the clock case. The wolf found gray kitten and ate her up. Next he found white kitten under the tub and ate him up but try as he would, he could not get black kitten in the clock case. And at last he had to give up and go home.

What a sorry sight met the mother when she came into the house. Two of her kittens were gone, only the black one remaining. This one she helped out of the clock case and he told her all that had happened. They started off in search of the wolf. They found him down by the brook fast asleep. His big meal had made him sleepy. The mother sent the little kitten back to the house for a pair of scissors, a needle and thread. When he returned she cut open the wolf and freed the other two kittens and all three ran to the edge of the brook for three stones which the mother sewed in the wolf. Then they all hid to see what would happen. When the wolf awoke, he went down to the brook to get a drink, saying as he went, "My but these kittens are heavy." As he leaned over to drink, the stones were so heavy that they made him lose his balance and he fell over into the water and was drowned. The four cats were so happy that they danced around and sang—

The wolf is dead,
The wolf is dead,
The wolf is dead, hurrah!

LITTLE HALF CHICK.

Once there was a hen which had five chickens, All of them were fine little fellows but the fifth one and he was not at all like the others. He was only half a chicken with but one leg and one eye, so his mother called him Half Chick.

She was very sorry for him whenever she looked at him for she thought he would never be able to go out into the world like the others but would always have to stay with her. But she soon found that she was mistaken as little Half Chick was not satisfied to stay at home under her wing.

Half Chick was not like the others in his ways as well as his looks. They played around the coop but whenever their mother clucked to them, they would run to her but Half Chick would pretend that he did not hear and would roam on farther. And the older he became, the worse he got. He would not mind his mother at all.

One day he hopped up to her and cocked his one eye and said, "Mother, I am tired of staying here and I do not intend to do so any longer. I am going off to see the King."

"To see the King," said his mother. "That is a long ways off—too far for even me to go. You could not go half the distance. Stay at home with me until you are bigger and then we will take a trip together."

But Half Chick was determined to go and off he hopped while his mother called to him to be kind to all he met.

He hopped along through a field and then he came to a stream that was filled up with weeds and waterplants so that it could not flow. It cried out to Half Chick, "Do come and help me! Please pull these weeds out so I can run along my way."

"Take time to help you when I am on my way to the palace of the King! Indeed not!" And with an extra hop, off he went.

He had gone quite a ways when he came to a fire that had been left in a wood. It was just about out and so it cried to Half Chick to bring some dry leaves and sticks to replenish it. But Half Chick said very unkindly, "Get them yourself and don't trouble me. I am going to the palace to see the King and have no time to waste on you." And off he hopped.

The next day when he was not so very far from the palace, he passed a large tree which had caught the wind in its branches.

"Oh, Half Chick," cried the wind, "won't you stop a minute and free me from these branches? I cannot get away by myself."

But Half Chick replied, "Then you should not have gone there. I can't take my time to help you. You got yourself into this trouble and now you can get yourself out the best way you can. I am going to see the King." And away he went.

Soon he reached the palace and he thought he would take a look around. As he was hopping at the back of the palace, the King's cook happened to look out of the window and see

him. "Just the thing for the King's dinner," she said and with that she hurried out and caught Half Chick by his one little leg and took him back into the kitchen where she dropped him into a pot of water. This she put on the stove. Little Half Chick did not like this at all as the water came up into his one little eye. So he called out, "Water, water, do not come up on me like this. You are getting me all wet."

But the water replied, "Half Chick, you did not help me when I was a little stream so now how can you expect me to help you?"

The cook came and stirred up the fire so the chicken would cook faster. This made it very uncomfortable for little Half Chick and he hopped from one side of the pot to the other. Finally he could stand it no longer and he called out, "Oh, fire, have mercy on me and do not burn me so."

But the fire reminded him that he had not helped the fire in the wood when it needed fuel and so now in turn he could not help Half Chick.

The cook came to see how the chicken was cooking and found that he had cooked up so that there was not much of him left, not enough to put him upon the table. She grabbed him out of the pot and gave him a toss through the window. The wind caught him up and whirled him so swiftly through the air that he could hardly catch his breath.

"Oh, wind, do not carry me so fast. I can hardly breathe," said he but the wind replied, "Half Chick, when I was caught in the tree and asked you to help me, you would not do it, so now do not expect me to help you."

So the wind whirled him about and finally dropped him upon the spire of a tall church where he stuck. There he remained and now he tells which way the wind is blowing. Little Half Chick became a weather vane.

LITTLE HALF CHICK.

THE LITTLE FIR TREE.

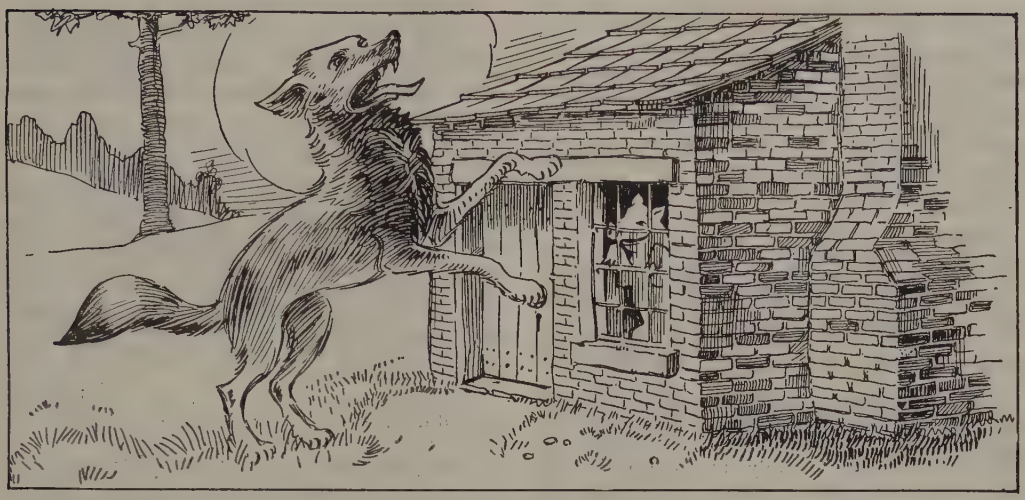
At the edge of a large forest there stood a little fir tree, the little green needles shining in the sun. The little tree was very well satisfied when it was winter time as it still had its green needles while the other trees were bare. But when summer came and all the trees had beautiful leaves and the wind played with them, rustling through them, the little fir tree began to wish that it had leaves instead of needles. It wished so very hard that a fairy heard it and lo! in the morning this little tree was covered with beautiful green leaves which made it feel proud indeed.

But that afternoon a goat and her seven kids came along by the little tree. "These little tender leaves will make us an excellent dinner and we can reach every one," said the mother goat. So they began to eat and it being a small tree, they soon stripped it of every leaf. This made the fir tree very sad and it decided that green leaves would never do as the goats would eat every one. So it wished and wished that it might have gold leaves. Again the fairy heard the wish and granted it. The next morning the little fir tree awoke to find itself covered with lovely golden leaves that sparkled in the sun. How proud the little tree was! But that night a robber came through the woods and as he came to the fir tree, the glitter of the gold caught his eye and he began to pick off the lovely leaves and put them in his bag. The tree being small, he soon had every leaf picked and once again the little tree stood bare.

"Well, green leaves will never do as the goats eat them and gold leaves will never do for the robbers take them. I believe I would like glass leaves," said the tree. The fairy heard the wish and came to the tree and said, "Are you sure you will be satisfied with glass leaves?" "Oh, yes, fairy. Please give me glass leaves." So in the morning the little fir tree was covered with glass leaves and it was indeed a beautiful sight and as the wind blew gently through the leaves it made sweet music. This pleased the wind so much that it began to blow harder and harder and the glass leaves knocking against each other, soon broke all to bits. And again the little tree stood bare.

"I can't have green leaves as the goats eat them and I can't have gold leaves for the robber takes them. And now I can't have glass leaves as the wind breaks them. I wish I had my own little pine needles back again," moaned the tree. The fairy appeared again and asked the tree what it wished now. "Kind fairy, do give me back my own dear needles and I will always be satisfied," said the tree. "All right," said the fairy. "This last wish I will grant." So in the morning the little tree awoke to find itself dressed in its own needles again and how good they looked to it. "Never again will I want any thing but my needles. They are best for a little tree like me for the goats do not eat them, the robber does not take them, and the wind does not break them," said the tree and so it grew at the edge of the forest and was happy and contented ever after.

German Fairy Tale.



THE THREE PIGS.

Long, long ago, when pigs could talk, an old mother pig lived all alone with her three little sons.

Their little house was right in the middle of a big oak forest where there were plenty of acorns and each little pig grew fat and round as an apple. All were as happy as could be until one year came when the heavy frosts killed all the acorns. Mrs. Piggy-Wig had a very hard time to find enough to feed her little ones. One day she had had worse luck than usual, so she called her three sons to her and told them that they would have to go out into the world to seek their fortune.

She kissed them all and started them on their travels, each down a different path.

The first little pig had not gone far when he met a man who was carrying a fine bundle of straw on his back.

"Please, Mr. Man, give me that straw so I can build me a house," said the first little pig.

The man, who was kind, gave the pig the straw and little Piggy-Wig built a cozy little house with it.

The little pig had just finished his house and was about to lie down and take a nap when a big wolf came along and knocked at the pig's door.

"Little pig, little pig, let me come in," said the wolf.

But the little pig said, "Oh, no. Not by the hair of my chinny-chin-chin."

Then the wolf in a very bass voice said, "I'll huff and I'll puff till I'll blow your house in."

So he huffed and he puffed and he blew the house in, because, you see, it was made only of straw and was very light. When the wolf had blown in the house, he ate up the little pig, even to the very tip of his curly little tail.

The second little pig had not gone far on his path when he met a man with a bundle of sticks on his back. When the little pig saw it, he bowed most politely and said, "Please, Mr. Man, will you give me those sticks to build me a house with?"

The man was generous and gave the sticks to the pig, who built a pretty little house with them.

No more was it finished than the wolf came to this house and said, "Little pig, little pig, let me come in." But the pig answered, "NO, no. Not by the hair of my chinny-chin-chin."

"Then I'll huff and I'll puff till I blow your house in," roared the wolf in his heavy bass voice.

So he huffed and he puffed, and he puffed and he huffed, and at last he blew the house in and gobbled up the second little pig.

But the third little pig met a man carrying on his back a load of bricks and mortar, and he said, "Please, Mr. Man, will you give me those bricks and mortar to build me a house with?"

The man gave them to him and the little pig set to work to build himself a house. It took him one whole day and night but when it was done it was a nice, strong little house.

When it was finished along came the wolf, just as he had come to the other little pigs.

"Little pig, little pig, let me come in," said the wolf. But the little pig smiled to himself as he said, "No, no. Not by the hair of my chinny-chin-chin. I'll not let you come in."

"Then I'll huff and I'll puff till I'll blow your house in!" said the wolf.

Well, he huffed and he puffed, and he puffed and he huffed, and he huffed and he puffed, but no matter how hard he huffed and puffed, he could not blow the little brick house in.

At last he could blow no more so he sat down to think it over. Pretty soon he called out, "Little pig, I know where there is a nice field of turnips."

"Where?" said the little pig.

"Behind Farmer Brown's house; and if you will be ready tomorrow morning at six o'clock I will call for you and we will go together and get some."

"Very well," said the pig; "I will be ready at that time."

Well the wise little pig got up at five o'clock, scuttled over to the turnip field and brought home a fine load of turnips before the wolf came. At six o'clock the wolf came to the

little pig's house and said, "Little pig, are you ready?"

"Ready!" cried the little pig. "Why, I have been to the field and back again and now I have a pot full of turnips on to boil for breakfast."

This made the wolf very angry and he said to himself, "I'll get that little pig someway or other." So he called out again in a very friendly voice, "Little pig, I know where there is a nice apple tree."

"Where?" said the little pig.

"Just over the hill in the big orchard," said the wolf. "If you will be ready to go tomorrow morning at five o'clock, I'll call for you and we will go together."

But the next morning the pig got up at four o'clock and was off and away long before the wolf came.

The orchard was farther off than the little pig had expected, so before he had filled his sack with apples, he saw the wolf coming over the hill. He was terribly frightened, but he tried to look very brave when the wolf came up.

"Little pig, why are you here before me?" said the wolf. "Are the apples nice?"

"Yes, very nice," answered the pig. "I'll throw one down for you to taste." So he picked an apple and threw it as far as he could and while the wolf was racing after the apple the little pig climbed down from the tree and ran home as fast as his little legs would carry him.

The next morning the wolf was on hand again, more determined than ever to get the pig. "There is going to be a fair in town this afternoon. Will you go with me to see it?"

"Yes, I shall be glad to go," said the pig. "What time shall we start?"

"At three-thirty," said the wolf.

Of course the wise little pig started long before that and went to the fair alone. After he had seen all he wanted to, he bought a large butter churn and started for home. He had not gone far when he saw the wolf coming up the hill. This frightened the little pig so that he did not know what to do, but he crawled into the churn to hide. This started the churn to rolling and down the hill it went, right toward the wolf. The wolf could not think what the strange thing was, coming straight down the hill toward him; so he turned and ran away home in a fright and he never went to the fair at all.

The next morning he went to the pig's house and told him all about the fright he had had and all about the big round thing that had come rolling down the hill at him.

"Ha, ha," laughed the pig. "So I frightened you, did I? That was a churn I bought at the fair, and I was inside it."

This made the wolf so angry that he vowed that he would eat the pig and that nothing would stop him. So he climbed upon the roof and jumped down the chimney.

But the wise little pig was ready for him, for he had built a big fire and hung a great kettle of water over it, right under the chimney. When the pig heard the wolf coming he took off the cover and splash! right into the kettle of boiling water fell the wolf. Before he could crawl out, the little pig popped the lid back on again and soon all was over for the wolf.

That night the little pig had boiled wolf for supper. So he lived in the little brick house very happily ever after and was never troubled with a wolf again.

LITTLE PETER OF HOLLAND.

At the edge of a little town in Holland there lived a woman and her boy. This woman used to bake cakes and pies to sell and the little boy delivered them.

One day the mother called to the little boy whose name was Peter, to come in and get a basket of cakes to take to the doctor who lived on the other side of the town. It was still afternoon and he would have time to go there and back before supper time. Peter took the basket on his arm and started on his way, whistling as he went. He followed the dike for that was the road.

Peter enjoyed the walk, there was so much to see. He would stop and watch the big sails on the windmills as they turned slowly around like huge white birds sailing through the air. Bright flowers grew on the banks and Peter stopped to pick some of these to take to the doctor.

At last he reached his house and after giving him the basket of cakes and flowers, he started on his way back home. Not wishing to be late, he hurried as already the sun had set and he knew his mother would be watching for him. After he had gone about half way he heard the trickling of water. What child is Holland who does not know the danger that that means! Looking over the side of the dike, on the land side, he saw a tiny stream running in from the sea. Something must be done at once. Peter dropped his basket and putting his hand up to his mouth he shouted as hard as he could, "Help, help! There is a leak in the dike. Come and help!" But no one was near to hear. No time could be lost so Peter ran down the side of the dike and put his little hand into the hole. "There is a leak in the dike! There's a leak in the dike!" he shouted again and again. Still no one came.

Stars came out in the sky and the night was dark. Peter was cold and hungry and frightened too, as he had never been out alone at night before. Still, he did not think of going home as he knew that leak meant danger and there was no one there but himself to keep out the sea. From holding his little arm in the one position so long, it soon began to ache but never once did he think of pulling it out. Tears fell from his blue eyes as he was cold and sleepy. He called again and again but no one heard.

When it grew dark, the mother came to the door to see if Peter was coming but no Peter did she see. She called but no one answered.

"Maybe he is staying with the doctor tonight although he has never done that before," mused the mother. "Still the man may be ill and has kept Peter to help him with his work. I shall wait until morning and then go over to the doctor's house to see."

Early the next morning the mother was up and was soon ready to start to the doctor's house. As she started from the house, she saw a crowd of people coming. Peter was carried by the big man in front and as they neared the mother they all raised their hats and shouted, "Peter is a hero! Peter is a hero! He kept out the

sea with his little hand and has saved us from a flood. He is a brave boy!"

Tears of joy ran down the mother's face when she saw her boy was safe and how proud she was of the little hero. Nothing was too good for Peter that day, nor for many days after as he had done the bravest thing a boy could do. And ever after he was pointed out as the boy who had saved the town from being flooded by keeping his hand in the hole in the dike.

THE BOY AND THE GOATS.

There was once a boy who had three goats, named Willie, Nannie, and Winkie. Each day he took them out to the meadow to graze and he would sit down by the gate and read a book. One morning he took the goats out but instead of them going into the meadow, they jumped the fence into a turnip field. Try as he would, the little boy could not get the goats out. Every time they came to the gate they would run right past it.

Finally the boy gave it up and sat down and cried. Soon a rabbit came hopping by. He stopped when he saw the boy crying and said, "Why do you cry, little boy?"

"My goats are in the turnip field and I can not get them out," said the boy.

"Don't cry any more," replied the rabbit. "I'll get them out for you."

So in he hopped and began to chase the goats. But every time they came to the gate, they would run right past it. So the rabbit gave it up and came out and sat down beside the boy and cried.

A fox came running by. When he saw the boy and rabbit crying, he stopped and said, "Why do you cry, rabbit?"

"I cry because the boy cries and the boy cries because he can not get his goats out of the turnip field," said the rabbit.

"Don't worry about that," said the fox. "I will get them out for you." So in he ran after the goats. But as with the rabbit, every time the goats came to the gate they ran right past it. So the fox sat down beside the other two and cried.

Next a wolf came along. He saw the three crying and so stopped to inquire. "Why do you cry, fox?"

"I cry because the rabbit cries, the rabbit cries because the boy cries and the boy cries because he can not get his goats out of the turnip field," said the fox.

"Never mind that," said the wolf. "I'll get them out for you as they will be afraid of me." So he gave the goats a chase but with the same result. He came out of the field very dejected and said, "I can not get the goats out." And he sat down and cried.

"Buzz, buzz! Buzz, buzz!" came flying a small bee. "Why do you cry, wolf?" he said.

"I cry because the fox cries. The fox cries because the rabbit cries. The rabbit cries because the boy cries and the boy cries because he can not get his goats out of the turnip field," cried the wolf.

"I'll get them out for you," buzzed the little bee.

"What! A bee do what a wolf can not!" said the wolf.

"What! A bee do what a fox can not!" laughed the fox.

"What! A bee do what a rabbit can not!" cried the rabbit.

"What! A bee do what a boy can not! Ha, Ha!" laughed the boy.

"Don't laugh," said the bee. "Wait and see what a bee can do." And in he flew and landed right on the back of Nannie. Buzz! Nannie gave a jump and ran out of the turnip field. Next the bee sat on Willie's back and buzz! he, too, ran out of the field. And last the bee sat on Winkie's back and he ran out of the field. Can you guess what made them run?

The bee flew back to the four friends and said, "Now see what a small bee can do."

"Thank you," they all cried. And the boy drove the goats home again.

Emilie Poulsson (Adapted).

THE LITTLE YELLOW BIRD.

It was a beautiful morning in the spring. The sun was shining so brightly that it put song in every one's heart. A little yellow bird felt it and said to himself, "I shall fly to the King's house and sing him a song this beautiful sunshiny morning." So off he flew.

Pretty soon he passed Gray Pussy's house. Gray Pussy called, "Where are you going, little Yellow Bird?" "I am going to the King's house to sing him a song this fine morning," replied the bird. "Come here and I will show you the pretty ring around my neck," said the cat. "Oh, no, Gray Pussy, you would only eat me up," said the bird and away he flew.

Next he passed Mr. Fox's house. He called to the bird, "Where are you going, little Yellow Bird?" "I am going to the King's house to sing him a song this fine morning," said the bird. "Do come here and I will show you the white tip on the end of my tail." "Oh, no, Mr. Fox. You would only eat me up," said the bird and on he flew.

As he flew along he came to the home of the Black Snake. Black Snake called, "Where are you going, little Yellow Bird?" "I am going to sing a song for the King this sunshiny morning," called the bird. "Come here instead and I will show you the rings on my tail." "Not me, Black Snake, for you would only eat me up." And on flew the bird.

Soon he came to the house where the Boy lived. When the little boy saw the Yellow Bird he called to it and said, "Where are you going, little Yellow Bird?" "I am going to the King's house to sing him a song. This is such a beautiful morning," said the bird. "Come here and I will give you some corn to eat," begged the boy. "Oh, no, little Boy. You would only put me in a cage. No, I shall not stop for the corn," said the bird and on he flew.

At last he reached the King's house and perched in a cherry tree just outside the window. Then he began to sing his beautiful song. The King heard him and said to the Queen, "Hear that beautiful song. Let us give the bird a bag of feathers for his nest." This they did. The bird thanked them and flew back to Mrs. Yellow Bird and they soon had a fine nest built, all lined with soft feathers.

THE THREE PIGGY-WIGS.

Once there were three piggy-wigs living together in a meadow. One was Great Big Piggy-Wig, one was Middle-sized Piggy-Wig, and one was Little Piggy-Wig. One day Great Big Piggy-Wig said to the other pigs, "Let us go across the bridge and eat those little red apples and make ourselves fat. You go first, Little Pig." Now under this bridge lived an old Troll whose eyes were as big as saucers and whose nose was as long as a broom stick. But Little Piggy-Wig started bravely across the bridge, his feet making a trip, trip sound as he went along. As he reached the middle of the bridge, the old Troll spoke up, "Who goes trip, trip over my bridge?" "It is I, Little Piggy-Wig. I am going over to the apple tree to eat red apples to make myself fat." "Don't you go any farther for I am coming up to eat you up," replied the Troll. "Oh, don't eat me up," said the pig, "Wait for Middle-sized Piggy-Wig. He is much fatter than I am." "All right—go on," said the Troll, "As I am pretty hungry today, I shall wait for your brother." So Little Piggy Wig went on over the bridge and was soon eating the red apples. Next came the Middle-sized Piggy-Wig. He was fatter than the first and his feet went trip, trap on the bridge. When he reached the middle of the bridge, the Troll said, "Who goes trip, trap over my bridge?" "It is I, Middle-sized Piggy-Wig. I am going over the bridge to the apple tree to eat red apples and make myself fat." "Don't you go any farther," said the Troll, "for I am coming up to eat you up." "Please do not eat me up. Wait for Great Big Piggy-Wig. He is much fatter than I am," said Middle-sized Piggy-Wig. "Very well," said the Troll. "I am pretty hungry today so I shall wait." So Middle-sized Piggy-Wig went on across the bridge and was soon eating red apples with his brother.

Now Great Big Piggy-Wig started across the bridge. He was so fat and heavy that his feet went TRIP, TROP on the bridge. Pretty soon the Troll called out, "Who goes TRIP, TROP over my bridge?" "It is I, Great Big Piggy-Wig. I am going across the bridge to the apple tree to eat little red apples and make myself fat." "Don't you go any farther," said the Troll, "for I am coming up to eat you up." "All right!" said Great Big Piggy-Wig. "Come on." So the Troll came upon the bridge but as he did so, Great Big Piggy-Wig ran at him and bumped him and thumped him and knocked him down into the river. And that was the last that was ever seen or heard of the Troll. Big Piggy-Wig stood upon the bridge and said, "Now who owns this bridge?" Then he went on across the bridge and joined his brothers. They all ate red apples and grew so fat that they never cared to go back to the meadow.

WHITE RABBIT.

Once there was a little white rabbit which lived near an oak tree. One day he was over under the oak tree looking for something to eat. All of a sudden something fell on his head and in fright he ran over to Brown Rabbit's house which was in a sand bank across the field. When he reached there he was too frightened to even say "Good Day" but instead he gasped, "Oh, Brown Rabbit, I am so frightened. Something fell from the oak tree and it fell upon my head."

"Did it hurt?" said Brown Rabbit.

"Hurt? I should say it did and I wish to know what it was," he replied.

"I am sure that I do not know what it was. Let us go and tell Gray Squirrel as he may know what it was," said Brown Rabbit

So away they ran to the home of Gray Squirrel which was in a tree.

"How do you do?" said Gray Squirrel to the two friends but White Rabbit said, "Oh, Gray Squirrel, I am so frightened. While I was under the oak tree near my house, something fell on my head."

"Did it hurt?" asked Gray Squirrel.

"Well, I should say that it hurt and I wish to know what it was," said White Rabbit.

"I do not know what it was," answered Gray Squirrel, "but perhaps Wise Owl could tell you what it was. He is very wise and knows most everything."

So the three hurried over to his home which was in a hole in a tree. Wise Owl was out on his front porch and when he saw the three, he said to them, "Good Day, my friends. What brings you here?"

"Oh, Wise Owl, I am so frightened. As I was under the oak tree, something fell upon my head."

Wise Owl sat and winked and blinked and then he said very slowly, "Did it hurt you?"

"Hurt me! Well, I should say it did and I would like to find out what it was," replied the White Rabbit.

There was silence again as Wise Owl winked and blinked. Then he said, "Did you look to see what it was?"

"Oh, no. I did not take time to do that as I was too frightened," said the rabbit.

"Then we must go back and see what it was," replied Wise Owl. So all of them went back to the oak tree. And here is what they found—a big brown acorn. White Rabbit laughed when he saw what had fallen on his head.

"Just think! I ran away from that," he said.

"How very wise Mr. Owl is," said the Brown Rabbit and the Gray Squirrel. But Wise Owl just winked and blinked.

THE THREE BEARS.

There once lived in a little cottage at the edge of a great, dark forest a little girl and her father and mother. This little girl had such lovely golden curls that her parents called her Goldilocks. Goldilocks loved to go out in the open and play but sometimes time flew fast and it would grow dark before she would realize.

She loved the deep, dark woods and had many friends with the little wild creatures. The birds sang to her and the little squirrels would play hide and seek with her. But she had been warned by her mother to not go far into the woods as there might be wild beasts that would do her harm.

One day it was a particularly nice day, the sun was shining brightly and the birds were singing so sweetly and seeming to invite her farther into the woods. Goldilocks forgot what her mother had told her and she soon found herself far, far into the woods. Still she was not frightened. She saw some lovely flowers and ran to pick them; then a playful squirrel invited her to give chase. But when she grew tired, she stopped and looked around her and discovered that the place was all new to her. How frightened she became! She remembered all that her mother had told her but alas! it was too late now. There she was in the woods all alone, lost, and very hungry after her run. Goldilocks sat down and cried.

When she had stopped crying, she looked about her and saw in the distance a little house. She knew it was not her house but she thought that maybe some one lived there who could show her the way home. She reached the little house after a short run and knocked at the door. There was no answer. She knocked again and still there was no answer. So she gently lifted the latch and walked in. No one seemed to be around but in the middle of the floor stood a table upon which were three bowls of soup and around the table were three chairs. The bowls and the chairs were of different sizes, one being large, one middle-sized, and one small. Goldilocks was very hungry and she though no one would care if she ate a bit. So she took a taste of the soup in the big bowl but that was too hot and it burned her tongue. She next tasted the soup in the middle-sized bowl, but that was too cold to suit her. So she tried the little bowl and found that was just to her liking and before she realized it, she had eaten every drop.

She was tired from her walk and she decided to sit down for a while. She tried the great big chair but that was much too hard for her. So she sat down in the middle-sized chair and found that too soft. She sank down in it so far that her feet would not touch the floor. She then tried the wee, small chair and that seemed just made for her. But the little chair was not made for as much weight and it broke right in two and the pieces fell on the floor.

Goldilocks decided to see what else the house contained and she went into the next room. There she saw a staircase that led up to the next floor where the bedrooms were. She walked up the stairs and there in the first room she saw three beds, all nice and clean with white, soft pillows on each. One was a very large bed, one was a medium-sized bed, and one was a tiny, wee bed.

After the good soup, and seeing the beds, Goldilocks realized that she was sleepy and so she thought a little nap would do no harm. First she tried the biggest bed but that was too high at the head. Then she tried the second bed but that was too high at the foot. She went over to the tiny, wee bed and climbed in. It was so comfortable that it was no time until she was sound asleep.

Meanwhile three bears—the father bear, the mother bear, and the baby bear, who lived in the house, came back from their walk. The father bear was a great, big bear; the mother bear was middle-sized, and the baby bear was wee, little.

When they came into the house they saw at once that someone had been in the house and for all they knew, might be there still.

The father bear in a great big voice said, "WHO HAS BEEN TASTING OF MY SOUP?" The mother bear in a middle-sized voice said, "*Who has been tasting of my soup?*" And the

wee bear said in a wee voice, "Who has been tasting of my soup and, oh, they have eaten it all up?"

When they went to sit down, the great big bear said in a great big voice, "WHO HAS BEEN SITTING IN MY CHAIR?" And the middle-sized bear in a middle-sized voice said, *"Who has been sitting in my chair?"* And the tiny wee bear said in a tiny wee voice, "Who has been sitting in my chair and, oh, they have broken it down."

They decided to make a hunt for the one who had eaten their soup and who had sat in their chairs. So up the stairs they went. When they came in the bedroom the great big bear said in a great big voice, "WHO HAS BEEN LYING IN MY BED?" And the middle-sized bear said, *"Who has been lying in my bed?"* And the little baby bear said, "Who is this lying in my bed?"

Their voices awoke Goldilocks and you can imagine her surprise when she saw the three bears standing by her bed. She jumped up and ran to the window, threw up the sash, and leaped out and ran for her home as fast as she could run. The bears were slow to realize what was happening and when they got to the window, GoldiLocks was out of sight.

She never stopped running until she reached her own home at the edge of the wood and after she had told her mother of her adventure, she promised never again to run so far away from home.

Robert Southy—Adapted.

HANSEL AND GRETEL.

Once upon a time there was a poor woodman who lived in a little hut near a woods. With him lived his wife and two children, a boy by the name of Hansel and a girl named Gretel. The father and mother worked hard to earn money to provide the children with food that they might grow strong and big. The father cut wood in the forest and sold it to the people in the village.

After one winter the father was poorer than ever as the heavy snows had kept him from going far into the forest to cut wood. It was so cold that they had to use most of what he did cut to keep themselves warm and so they had very little money coming in. At last he did not have enough to buy food for the family.

One night after the children had gone to bed, he and his wife sat up talking and trying to think of some way to provide for them. Finally the father said, "The good Father in Heaven may take pity on them if I cannot give them food. Let us take them into the woods and leave them there and the Good God will find shelter and food for them." The mother tearfully consented and they decided that the next morning they would take them into the woods and leave them to the care of God.

The children had not gone to sleep and they heard what the father and mother planned. Gretel cried and said, "What will become of us?" But Hansel told her not to cry as he would find a way out. As soon as the parents had gone to bed, Hansel got up, slipped on his clothes, and stole out into the moonlight. The little white pebbles which lay before the door, shone like silver and he stooped down and picked up enough to fill his pockets. Then he went back to Gretel and said, "Do not be afraid, dear sister. Go to sleep and rest as God will not forsake us." And then he, too, went to bed again.

The next morning, before the sun was up, the mother went and called the children. "Come, children, we are going into the woods to cut some wood." She gave them each a piece of dried bread and told them that it was for their dinner but that they must not eat it until it was that time as it was all they could have.

All four started on their way and every little while Hansel would stop and look back at the house and every time he stopped he would drop a little pebble out of his pocket upon the path.

When they came to the middle of the woods, the father told the children to gather some wood and he would make them a fire so that they would not be cold. So Hansel and Gretel gathered quite a pile of dry wood and the father set fire to it. "Now, children, lie down near the fire and rest yourselves while we go farther into the forest to cut wood. When we are ready we shall call for you," said the mother.

The children first ate their bit of bread and then, because they were tired, they lay down and soon dropped off to sleep. When they awoke it was quite dark and this made Gretel cry. "Don't cry, sister," said Hansel. "Wait until the moon rises and we will find our way home. Soon the moon shone forth and the little pebbles that Hansel had dropped, looked like bits of silver in the path and Hansel, taking Gretel by the hand, started on their way. All night they traveled and then just as day was breaking, they reached their father's house. When the mother saw them, she broke out crying and hugged and kissed them and the father did likewise, for both had felt very badly over the loss of their children.

All went well for a while, but once again hunger came upon them and the parents realized that the children would starve to death if something was not done. So one night the children overheard the father say to their mother, "Everything is again eaten up; we have only one half of a loaf of bread left and when that is gone, the children will surely die. We must put them in the care of God again." With many sobs, the mother said, "Yes. We will take them farther into the woods so that they cannot find their way out."

When all was quiet and the house was wrapped in sleep, Hansel got up and went after more pebbles. But when he got outside no moon was shining and he could not see one. He went back to bed and comforted Gretel again by saying that the Good God would not forsake them.

The next morning the mother came to them and told them to dress to go to the woods. As before she gave them a piece of bread for their dinner. On the way Hansel broke his piece of bread in his pocket and every little while he would drop a crumb on the path.

This time the parents led then far into the woods where they had never been before and,

making a fire, they said to them, "Now lie down and rest and sleep. When we have chopped all the wood we need, we shall come to you."

When dinner time came Gretel shared her piece of bread with Hansel as he had scattered his along the path. It was not enough and from weakness, the children soon fell asleep. When they awoke in the dark night, Gretel again cried but Hansel told her to wait till the moon came out and then they would find their way home. But when the moon did shine, they could not see a single crumb for the birds had picked them all up. Hansel did not give up and would say, "We will soon find the way;" but they did not although they walked all that night and the next day. Still they could not find the way out of the woods. Soon they were so tired that they could not drag themselves another step and so they lay down under a tree and fell asleep.

It was now the third day since their parents had left them in the woods. They had had nothing to eat except berries that they found along their way and they began to realize that if they did not reach the edge of the woods soon that they would perish. All of a sudden they saw a light and they hastened to reach it. When they got there, they found a dear little cottage and imagine their delight when they saw that it was made of gingerbread and cookies with doughnuts for the windows and a roof of sugar.

"Now we shall eat our fill," said Hansel. "I shall take a bite of the roof first and you can eat a window." Hansel reached up and broke a piece off of the roof and was eating when a voice called, "Nibble, nibble, mousekin, who nibbles at my housekin?" "It is but the wind," said Hansel and the children went on eating. Soon the door opened and a homely old woman on crutches hobbled out. The children were frightened when they saw her and they dropped their food and started to run. But the old woman called to them and said, "Ah, dear children, what has brought you here?" When the children had told her their story she took them by the hands and led them into the house where she gave them a good supper. And then she put them to bed in nice little beds where they soon went to sleep.

But the old woman was not good as it would seem. She was really a bad witch and she wanted to lure children to her house where she made them serve her. The next morning the old witch awoke the children with a voice as rough as it had been sweet the night before. "Wake up, you lazy ones. Do you think you have nothing to do but eat and sleep?" and with that she dragged them out of their beds and put them to work—Hansel to gather wood and Gretel to sweeping and dusting. Neither child had been used to hard work and was soon exhausted. But the old witch kept them at it until night. They were so tired by then that they went right to sleep when they went to bed and had no time for fear. The next morning the old witch put Hansel in a cage to fatten to eat and she made Gretel cook things for him to eat. The time came at last when the old witch though he was fat enough to eat and so she called Gretel to come and see if the oven was hot. It was a queer old oven and Gretel said she did not know how to peep into it. The witch said, "Stand up on tiptoe and look it." But Gretel saw that she meant to shove her in when she opened the door, so she said, "You will have to show me how." The old witch stood up on her tiptoes and peeped into the oven and while doing so, Gretel gave her a push and in she went. Gretel hurriedly closed the door and there was the old witch caught in her own trap. Gretel went and unlocked the cage that contained Hansel and both children were once more free.

They ate all they could and then started off to find their way home. A little white bird was flying overhead and Hansel said, "Let us follow the bird and perhaps it will show us the way." Sure enough! When they had crossed a little stream not far from the witch's house, they found they were in a part of the woods that was familiar to them. They traveled on and it was not long until they reached home. How good it looked to them. And how glad the father and mother were to see their dear children back again.

Hansel was able now to help his father and so the father could cut more wood and have more to sell. Gretel helped her mother in the house. Soon they were able to have some hens and they sold the eggs; and then a cow and they sold butter. They were very happy now and had plenty to eat. The children always helped and all went well for the rest of their days.

Adapted from Wilhelm and Jacob Grimm's Hansel and Gretel

BILLY BOB TAIL.

Once there was a little boy by the name of Billy Bob Tail. He had no home and he had no friends. He decided he would go out into the world and seek his fortune. As he walked along, he met a cat.

"Mew, mew! Where are you going, Billy Bob Tail?" said the cat.

"I am going to seek my fortune," replied Billy.

The cat asked if he could go with him but Billy said that he did not want him to go.

"I have no home and I have no friends Please let me go with you," begged the cat.

Billy felt sorry for the poor cat and so he told him to come but warned him to not scratch him.

The two friends walked along together and soon they met a dog.

"Bow, wow!" said he. "Where are you going, Billy Bob Tail?"

Billy told the dog that he was going out into the world to seek his fortune. The dog wanted to go along but Billy said that he didn't want to be seen with a dog and a cat. But the dog begged and begged as he had no home. He was getting old and his master had said he would kill him. Billy felt sorry for the poor dog and said he could go but he didn't want him to bite him.

The three friends walked on down the road and soon met a cow.

"Moo, moo!" said the cow. "Where are you going, Billy Bob Tail?"

Billy told her the same that he had told the others and she too asked to go along. But Billy did not want to be seen with a cat, a dog, and a cow and he said so. But the cow told him that her master was going to kill her and eat her as she had heard him say so and she didn't want to stay for that. Billy didn't want the cow killed either and so he told her to come along but told her that she must not hook him.

Now the party of four journeyed on until they met a goat who said, "Baa, Baa! Where are you going, Billy Bob Tail?"

"I am going out to seek my fortune and you may go with us if you will be careful not to butt me," said Billy.

On and on the friends went until they came to a dark forest. They decided that they would go into the woods as the fortune they were looking for might be in there.

Billy told the friends to not be frightened as he could whistle and throw stones. The cat said it could mew and scratch; the dog could bark and bite; the cow could moo and hook, and the goat could bleat and butt. So the five thought there was nothing to frighten them since each could do so much and in they started. They had not gone far when they saw a house and from the house was issuing a deep growl. What could it be? Billy thought it was a bear and he told the friends to make all the noise they could and that would frighten him away. So all together they went—a whistle; mew, mew; bow, wow; moo, moo; baa, baa! The bear was very much frightened at the dreadful noise and he ran out of the house and never went back again. The five friends lived there and were very happy in their new home and in the thought that their fortune was found.

Folk Tale.

THE GINGERBREAD BOY.

There was once an old woman who lived with her husband in a very old house. They had but one son.

One day while she was making a cake, she said to the boy that she would make him a little gingerbread boy for him to play with. So she rolled out the dough and cut a little boy. Then with red sugar she covered his hat. With yellow sugar she fixed the coat, and she put brown sugar on his shoes. She put him in a pan and stuck him in the oven. Then she told the little boy that he must stay there and watch to see that the little gingerbread boy did not burn. She said that she would leave the oven open and then he could see. That was just what the little gingerbread boy wanted. The little boy nodded and fell asleep and out jumped the gingerbread boy. As he ran out of the house he called, "I can run away from you, I can." The old woman called to her husband to come and help her catch the gingerbread boy.

The gingerbread boy ran on and on until he came to a barn where some men were threshing wheat and as he came by the door, he called,

"I am a little gingerbread boy.
I've run away from a little old woman,
A little old man,
A little boy,
And I can run away from you,
I can, I can."

The men all ran out of the barn and began to chase the gingerbread boy but he could run very fast and soon he was out of sight and the men gave it up and returned to their work.

Next the little gingerbread boy came to a field of mowers. He called to them,

"I am a little gingerbread boy.
I've run away from a little old woman,
A little old man,
A little boy,
A barn full of threshers,
And I can run away from you too,
I can."

The men started after him but he ran so fast that they, too, had to give up the chase.

On, on he ran until he met a cow. To it, he called,

"I am a little gingerbread boy,
I've run away from a little old woman,
A little old man,
A little boy,
A barn full of threshers,
A field full of mowers,
And I can run away from you, too,
I can."

But the cow did not stop chewing her cud. She didn't appear to hear him. So he ran on until he met a fox to whom he called,

"I am a little gingerbread boy.
I've run away from a little old woman,
A little old man,
A little boy,
A barn full of threshers,
A field full of mowers,
A cow,
And I can run away from you too,
I can."

A fox can run very fast and he gave the gingerbread boy a lively chase. At last they came to a river that was very wide. There both had to stop.

"Would you like to get across?" said the fox, very politely.

"Indeed I should," replied the gingerbread boy.

So the fox told him to jump on his tail and then into the water he swam. The water came higher and the fox told him to climb upon his back for fear he might drown. This the gingerbread boy hastened to do. The fox swam a little farther and the water got deeper so he called, "Jump up on my nose as I am afraid you will drown on my back as the water is getting real deep." The gingerbread boy jumped on his nose where he stayed until they reached the shore and then SNAP! The fox opened his mouth and in went the little gingerbread boy!

THE TRACKS TO THE DEN.

A lion and his mate lived in their den in a large forest. They were getting old and food was scarce. One day the mate came to the lion who was lying in front of his den and said, "We must have food. It has been three days since we have eaten."

"What can we do? We are both too old to hunt now and the animals will not come here to be killed," said the lion.

"We must think of some way to bring them here," said the mate. "Let us say we are sick. Then they will come to visit us."

"A very good plan, mate! A very good plan, indeed!" said the lion.

A crow flew to a tree near by and the mate told her that they were sick and lonesome and would like to have some company. The crow is a great talker and at once she flew away with the news.

"You shall have the first one, dear. I'll wait outside and send him in," said the lion to his mate. So the mate went inside of the den.

Soon the wolf came and said, "I hear that you are sick, sir."

"Yes, so sick, friend wolf, and so lonesome!" said the lion.

"Why then, I'll sit and talk with you," said the wolf.

The lion bade him enter the den and he would follow but instead he remained outside. Soon the mate came out and said, "The plan works fine! That wolf was nice and tender."

Soon two lambs came to call on the lions. "We hear you are very sick," they said. "Your voices are as weak as ours."

"Alas, we are both like little lambs, now. Won't you come into our house and sit with us for a little while. We get so very lonesome," said the lions.

So the lambs entered the den and the lions followed. All was quiet for a while and then the lions reappeared at the door.

"I like spring lamb," said the mate and the lion said he too, was very fond of it.

Soon a fox came along but he stayed at a safe distance. "Good morning, friends! I hear you are very sick," he said.

"Oh very, very, very sick," said the lion and his mate. "Why do you stand so far away? Come near and talk with us, my dear."

But the fox said he had to go. "Go! Did you not come to visit us?" said the lions in unison.

"Yes, but I cannot stay," said the fox. "I see many tracks going into your den but not a single track comes out! Not even a footprint. It is strange, isn't it, friends? I think I shall be on my way." And with that off ran the fox.

"That fox is very clever," said the mate. "Yes, much too clever," replied the lion.

THE HONEST WOODMAN.

There was once a woodman cutting down a tree on a river bank. All at once the ax flew off the handle and fell into the river. "Dear me," said the woodman. "What shall I do now? My ax has fallen into the river and I can cut down no more trees and I can not get food for my children."

"I will get your ax, good sir," said a fairy.

"You must not dive, kind fairy, as the river is too swift here," said the woodman.

"No river is too swift for me," replied the fairy. And she dived in and soon came up with a gold ax. "Is this your ax, woodman?"

"Oh, no! That ax is gold. That is not my ax."

"Then I will dive again," said the fairy. This she did and soon she came up with a silver ax.

"Is this your ax, woodman?" she asked.

"Oh, no! That ax is silver. That is not my ax," again said the woodman.

So the fairy dived the third time and came up with the woodman's ax.

"That is my ax! That is my ax!" shouted the woodman.

"You are an honest man, sir, and I am pleased with you. You shall have all three of the axes as a gift from me," said the fairy.

"Thank you, good fairy. I thank you," replied the man and he went joyfully home to show his wife and children the fairy's gift.

A second woodman had been cutting trees near the place where the first one lost his ax and he had seen all. "Why should not I have a gold ax too? I will! Indeed I will!" said he. So he threw his ax into the river and then sat down and began to weep.

The fairy came to him and asked him why he was weeping. "Alas! Alas! My ax fell into the river," cried he.

"Weep no more," said the fairy. "I will bring it up for you." And she dived down into the river and brought up a gold ax. "Is this your ax, woodman?" said she.

"Yes, yes! That is my ax. Why do you hold it away from me?" he said.

"I am not pleased with you, sir. Your ax was not of gold! Your ax lies in the river and there it shall lie forever, forever!" said the fairy and then she went away.

"I wish I had not done it! Oh, I wish I had not done it!" cried the woodman but it was too late.

THE STORK.

Hans and Katrina lived with their mother and father in a city of Holland. Their house was made of brick, painted blue with snowy white door and window frames. On the roof a stork had built her nest and there she lived with her babies. How the children liked to watch the storks and many pleasant minutes were spent in watching the mother stork fly down to the ground for food and then up again where several hungry mouths stood open ready to receive. The children got so they would put out grain for the mother and she did not have to go far to obtain enough to feed her babies.

One day the house next to Hans' and Katrina's home took fire and soon smoke was rolling from the roof and sparks were flying high into the air. Everywhere was confusion and in the excitement no one thought of the danger the storks were in. The mother stork flew upon the nest and with her wings tried to fan away the smoke that came in clouds over the house. As the fire grew worse, the sparks settled down and mother

stork had no time to fan the smoke away. All she could do was to keep the sparks away from her babies by spreading her wings over them, never once thinking of the danger to herself.

At last the firemen got the fire out. Hans's father looked upon the roof of their house and there saw the poor stork. He hurriedly got a ladder and climbed to the top and carried the stork to the ground. Upon examination, it was discovered that the sparks had burned the wings so badly that she could never fly again. But she had saved her babies by her heroic act. The mother and the little storks were taken care of by the children and their father and mother until the little ones grew big.

The market house was not far from their home and it was no uncommon sight to see the mother stork walking around in there, picking up the bits of food that were dropped on the floor and in that way she was a great help in keeping the market clean and she soon became the friend of everyone.

ANDROCLES AND THE LION

In the city of Rome, there lived a man by the name of Androcles. He was a slave and his master was hard and cruel. When he was angry, he would beat Androcles very severely. The slave stood it as long as he could and then one night he ran away. He hid in the dark woods for many days, only going forth at night to get his food for fear some one would recognize him and take him to his master.

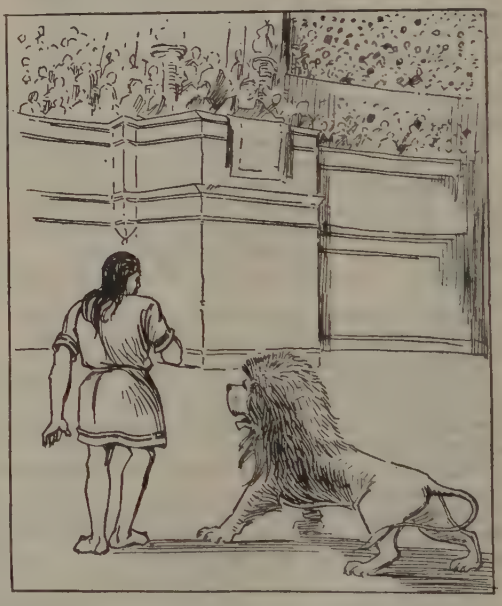
One day in the early evening Androcles was forced to look for food as he was about starved. As he wandered about in search of something he came unexpectedly upon a lion. It was lying down, moaning and groaning. At first, Androcles turned to flee but he noticed that the lion did not pursue him and so he returned to see what was the matter. He went up to the lion and there he saw a large thorn in one of his front paws. He pulled out the thorn and bound up the paw. The lion thanked him just as a dog would do. He jumped about him and licked his hands and feet.

Androcles was no longer afraid and that night the two slept side by side. The next day the lion took the slave to a cave which was his home and every day the lion would go forth and bring food to Androcles. The two became very good friends.

But alas! One day as they were out for a walk in the woods some soldiers came marching by. They saw Androcles and recognized him as they had often seen him with his master. So they took him back to Rome. Now the master was more cruel than before. He beat him and had iron chains fastened to his legs so he could not run away again.

Finally he was taken to a large place that looked like a circus ground. A large stone wall ran around this and against this wall were hundreds and hundreds of seats. People would come to this place to see men fight wild beasts. Androcles was led into the center of the ring and the chains loosened. From another door came a roaring lion. Androcles must fight that lion. How frightened he was! He stood and waited for the lion to come and kill him as he was sure that would happen. The lion came on roaring and exposing the large teeth. One more spring and the lion and man were side by side. Then a queer thing happened. Androcles gave a cry of joy and threw his arms around the lion's neck. The lion licked his hands and feet. The two friends had found each other again.

The people who had come to see the fight could not understand and they shouted and waved their hands. The Emperor called Androcles to him and asked him to explain and when Androcles told him the story, he set the man free and the lion was freed, too. The two went out of the ring together. The lion was given to the slave and they lived together in Rome for many years.



ANDROCLES AND THE LION.

THE LITTLE RED HEN.

In a barnyard there lived a very thrifty and hard working red hen. One day as she was scratching around for food she came upon a few grains of wheat. She called to the dog, the pig, the cat, and the rat and said, "Who will help me plant this wheat?"

But the dog said, "I will not."

And the pig said, "I will not."

And the cat said, "I will not."

And the rat in his squeaky voice said, "I will not."

"Then I will have to do it," said the little red hen, and she started to work. She dug up the ground with her sharp little feet and soon the few grains of wheat were resting in the soft earth. Days followed in which there was a

little rain and plenty of sun and soon the wheat grew up straight and tall and it was ready to cut.

"Who will cut this wheat," said the little hen but the dog and the pig said, "Not I." And the cat and rat said, "Not I." The little red hen said, "I will then." And with her little bill she cut every blade.

The wheat was ready to thresh and again the little red hen called for help but each again said that they would not help and the little hen had to thresh the wheat all by herself. So she fanned it until she had every grain threshed out.

"This wheat will make nice flour," she said. But who will help me grind it?"

"Not I," said the dog.

"Not I," said the pig.

"Not I," said the cat.

"Not I," said the rat.

"Then I shall do it myself," said she and with two small stones she rubbed the wheat together until she had nice flour.

Now the flour was ready to make into bread but upon being asked to help, the dog and the pig and the cat and the rat said, "Not we. We shall not help make the bread."

"I shall do it then," said the hen and she kneaded and kneaded the dough until she had three loaves of bread ready for the oven. She put them in and soon there was the tempting smell of fresh baked bread coming from the oven. How good it smelled! It made one feel hungry. At last it was done and the little red hen took it out of the oven and then she said, "Now, who will help me eat this bread?"

"Oh, I will," said the dog and the pig.

"And I will," said the cat and the rat.

But the little red hen replied, "No! Not you. I shall call my little chicks and they and I shall eat the bread. You did not help to make it and you shall not help to eat it."

"Bow-wow," said the dog.

"Squeak, squeak," said the pig.

"Meow, meow," said the cat.

"Dear me!" said the rat

THE FOUR FRIENDS.

Once there was a poor donkey that had grown too old to work. He heard his master say one day that he was useless and should be killed.

"I shall not stay here and be killed," said the donkey. "I shall go to town and play in the band." And off he started down the road.

Soon he met a dog, lying by the road. He seemed unhappy and the donkey felt sorry for him. "Why are you here, Dog?" said the donkey.

"I used to hunt for my master but now I have grown too old. My eyes are not like they were when I was young and I cannot see the game. And now my master intends to have me killed for I heard him say so," said the dog.

"Do not stay here to be killed," said the donkey. "Come with me and we will go to the town and play in the band. You can play the flute and I can beat the drum."

So the donkey and the dog started on down the road. Pretty soon they saw a cat. The cat, when she saw the two friends, called out, "Where are you going?" "We are going to the town to play in the band," said the two.

"Let me go with you?" asked the Cat. "I am too old to catch mice any more and my mistress said that I would have to be drowned and I do not want to die yet."

"Surely you can go with us as you can sing while we play the flute and the drum," they said. So the cat joined them and the three continued on their way toward town. In taking a short cut through a farmyard they saw a rooster standing on a fence. He was crowing as loudly as he could. The friends stopped to listen and when he had finished, they said to him, "Why do you crow so loudly?"

"How happy I have been living here at this farm. I had plenty to eat and plenty to drink and now that I am nice and fat, the cook intends to cook me for dinner tomorrow. So I shall crow while I can for my time is short," said the rooster.

"Why don't you come with us and not stay here to be cooked," said the donkey. "We are all going to the town and play in the band. I shall play the drum, the dog the flute, and the cat will sing. You can sing, too, since you have such a beautiful voice."

The rooster was only too glad to go and so he flew off the fence immediately.

It was getting late and the four friends realized that they could not get to the town that night and that they must find a good place to sleep. They came to a woods and they decided to stop there. The rooster flew up into a tree, clear up to the tip-top. The cat climbed up to the first branch and there settled herself for the night. The dog and the donkey lay down on the ground under the tree and soon all were asleep but the rooster. He could not go to sleep for thinking of the narrow escape he had had. He was so happy that he was saved and he perched there and looked all around in a very satisfied way. All at once in the distance he saw a light. He called his new friends and said, "Wake up, friends. I see a light and there must be a house close by. How good supper would taste, so let us go and ask them for something to eat."

"I would like a juicy bone," said the dog as he awoke.

"And I, a fat mouse," said the cat.

"I'll take some corn for mine," said the donkey.

They started off at once to the place where they saw the light, and sure enough, it was coming from the window of a little brick house. The window was too high for any but the donkey to see in so he walked over to it very quietly and looked in.

"I see a table laden with many good things to eat and around the table are four robbers. Let us think of a way to frighten them away so we can have the good things to eat," said the donkey.

They got their heads together and thought and thought. Finally the dog said, "Let us all make our loudest noise and it will be so terrible when we do it all together that we will frighten the robbers away and we can have the food and the house in which to spend our old age. What say, my friends? The donkey can stand with his

fore feet upon the window sill and I can climb upon his back. Then the cat can get on my back and the rooster on the cat's back. I shall count three and we shall make the loudest noise we can."

At three the donkey brayed, the dog barked, the cat meowed, and the rooster crowed. Such a noise they made! The robbers were so frightened that they ran out of the house as fast as they could go. The four friends went on into the house and sat down to a good feast. After they had eaten all they could eat, they felt sleepy and each began to look for their beds. The donkey went outside to sleep. The cat curled up in front of the fireplace. The dog went to sleep by the door and the rooster went outside and flew up into a tree. Soon all were fast asleep.

The robbers had run a safe distance from the house when they heard the dreadful noise and then had stopped to see if they were followed. They waited several hours and then as all was quiet they decided to creep back. One went on ahead and, meeting no one, he opened the door of the house and walked in. He went to strike a light at the fireplace and that woke the cat who flew at him and scratched him with her claws. He turned to run and as he passed the door the dog bit him in the leg. In panic, he rushed out of the house and passed the donkey who woke in time to give him a good kick. He went back to the other three robbers and told them of his sad experience and they decided to never go back to the little house again and it was left to the four friends who lived happily ever afterwards.

Adapted—Grimm.

KING MIDAS.

Adapted from the story by
Nathaniel Hawthorne.

Once upon a time there lived a very rich king by the name of Midas. He loved gold almost more than anything in the whole world. There was just one thing that he loved more and that was his only child, a little girl whom he called Marigold because of her lovely golden curls.

Midas kept his gold in an underground room of the palace and his greatest pleasure was to go down to this room, lock the doors securely, and then take out the bags of gold and spread it all out on a table. He would fondle it and let the sunshine shine in on it to make it glisten all the more. But the more that he had, the more that he wanted. When he looked at the gold tinted clouds of the sunset, he wished that they were real gold that he could pack them into his bags.

Before he became so fond of gold, Midas had admired flowers very much and had planted a garden in which grew the largest and most fragrant roses any one ever saw or smelled. Midas would spend hours in the garden admiring them and inhaling their wonderful perfume. But now, if he looked at them at all, it was to figure what the garden would be worth if every petal of the roses was a thin plate of gold. He got so greedy for more gold that all he wanted to see was gold and all he wanted to hear was the chink of one coin against another.

One day as usual, Midas was enjoying himself down in the underground room, when he noticed a shadow fall across the heaps of gold and, looking up, he saw a stranger. As Midas knew that he had turned the key in the lock very carefully when he came into his treasure room, he felt sure that the stranger he looked upon was no mortal man but a fairy instead.

The stranger gazed about the room and then turned to Midas and said, "Midas, you are a very wealthy man. I doubt if there is a room in all the world that contains so much gold. You must be very happy and entirely satisfied."

"Yes, I have done pretty well. But after all it is but a mere trifle when you think that it has taken my whole life to get it together. If one could live to be a thousand years old then he might have enough wealth to be proud of," answered Midas.

"Oh, you are not satisfied?" exclaimed the stranger. "Pray what would satisfy you?"

Midas paused and thought. At last a bright idea came to him and he said to the fairy, "It has been a hard task to gather this gold together and it has taken me too long a time. I wish that everything I touch would turn to gold."

"The Golden Touch!" exclaimed the stranger. "But are you sure that this will satisfy you?"

Midas said that it was all he wished and that he would never regret the wish and so the fairy told him that at sunrise he would find himself gifted with the Golden Touch. With this the fairy seemed to fade away into the air and was gone.

Midas could hardly sleep that night for thinking of the wonderful fortune that had come to him. When the first light of day peeped over the hills Midas was awake and was stretching his arms out to touch the objects that were within his reach. He was anxious to see if the Golden Touch was a reality or not. He touched a chair and it became gold. The bed clothes were no longer linen but were changed to a woven texture of the purest gold. Midas was delighted and he jumped from the bed and rushed to the window to let the sun in to shine on the golden objects. As he pulled the tassel of the shade, it, too, turned to a mass of gold. He hurriedly put on his clothes and was overjoyed to see himself arrayed in a suit of gold.

Midas was so enraptured that the room seemed too small for him and so he went downstairs and the bannister of the stairs turned to a bar of shining gold as his hand passed over it in his descent. He lifted the door-latch (it was gold now) to look out upon the world and he noticed the lovely roses growing in the garden and he thought of how often he had wished that each petal was gold. So he went out and touched every rose and they were changed to gold.

Breakfast was called and as the morning air had given him a good appetite, he hastened back to the palace and sat down to the table. He picked up a glass of water and it turned to gold. He tried a cup of coffee, and that turned to gold. Dear, dear! This was not so funny for he had nothing to drink.

Next he took up an egg and that turned to gold. He tried some bread and butter and they met the same fate. No, indeed! This was not so funny as he had nothing to eat.

As Midas was wondering what to do, in came Marigold, crying as if her heart would break and in her hand was clasped a golden rose. Her father said to her, "Why do you cry, my Marigold?"

She held up the rose that her father had so recently changed.

"Well, what is in this magnificent rose to make you cry? Is it not beautiful?"

"No, dear father, it is the ugliest flower that ever grew and its lovely fragrance is all gone. Something dreadful has happened to all the flowers as they have all turned yellow and no longer smell sweetly." And Marigold burst forth into tears again.

To comfort her, Midas got up from the table and walked around to the child. He put his arms around her and, behold! what had he done! The moment he put his arms about her, a change had taken place. Her rosy face had assumed a yellow color, with yellow tear drops upon the cheeks. Her hair was of the same tint. Her little soft, flexible body grew hard and rigid. No longer did Midas have a human child but in her stead, a golden statue. Midas was beside himself with grief as you remember he loved his little girl even more than gold and now here she was lost to him. He wrung his hands and wished that he was the poorest man in the world if he could just have Marigold back again.

While he was in the depths of despair, he suddenly beheld the stranger before him.

"Well, King Midas," said the stranger, "how do you succeed with the Golden Touch?"

"I am most miserable," replied Midas.

"How does that happen? Did I not keep my promise to you? And do you not have everything that your heart desires?" said the stranger.

"Gold is not everything," wailed Midas. "I have lost my most precious possession, Marigold, who was more to me than anything else in the world. Oh, my child, my dear child! I would not have given her one little finger for the power of changing this whole world into a solid lump of gold." And Midas bowed his head in grief.

"You are wiser than you were, King Midas," said the stranger. "Tell me now, do you wish to rid yourself of the Golden Touch?"

Midas replied that it was most hateful to him and so the stranger told him to go to the river and plunge into it. He told him to take a pitcher and fill it with the water and then bring it back to the palace and sprinkle it over any of the objects that he wished changed back again into its former substance.

King Midas lost no time in rushing to the river. Upon reaching the shore, he plunged headlong in, without even waiting to remove his clothes. As his head emerged from the water, he was conscious of a change in himself. It seemed that a heavy weight had been lifted off his heart. He hurriedly dipped in the pitcher which had turned golden with his touch and he was overjoyed to see it turn back to glass. He filled it with the river's water and then hastened back to the palace. The first thing that he did was to sprinkle some on the golden figure of Marigold.

No sooner did it fall on her than the rosy color began to come back into her face and once more she was the dear little girl whom Midas loved.

Midas had grown so much wiser and had found that there are many things that are more valuable than gold. He did not care to have constant reminders of the time when he had been so foolish as to think that gold was all that counted in life, that he sprinkled the precious water on everything that he had changed when he had the Golden Touch and now Midas was a happy and contented king.

THE ANT AND THE GRASSHOPPER.

In a field one summer's day a grasshopper was dancing about to her heart's content. Wearying of playing by herself, she hopped over to the home of Mrs. Bushytail and invited her to join her in a dance. The squirrel told her that she was too busy storing away food for her winter's use to waste her time dancing and hopping about. She told the grasshopper that she, too, should be getting ready for the winter as summer could not last forever.

"Bah," said the grasshopper, "why work when the day is sunny? You may do so if you wish but I shall enjoy myself." And she hopped on. She soon saw Mrs. Bee gathering nectar for honey. She called to her and said, "Come and dance with me. Let us have a merry time. The sun is too bright to waste your time working."

"Dancing may be a very pleasant thing but summer is short and then comes the winter and we should all be prepared. Buzz, buzz, buzz! I can not idle here talking to you for I must away and gather pollen for my bread." And again the grasshopper was left alone.

She shook her head and laughed. "I don't

believe there is any such thing as winter. They can all work if they want to but I shall have my fun. I shall go and see if Mrs. Ant will dance with me." But Mrs. Ant was busy carrying along a kernel of corn. She was taking it to her home. Grasshopper called to her to come and dance with her but the busy ant said she had too much work to do, enough to keep her busy all the summer as she had a great many children to feed and they got hungry in winter as well as in summer. "You had better work, too," and with that the ant picked up the corn and started on her way.

But the winter did come, much to the surprise of Mrs. Grasshopper. The days grew very cold and food became scarce and often she was hungry. Then came the snow and the grasshopper could not find one thing to eat. Something had to be done! She hopped over to Mrs. Squirrel's house and knocked at the door but all were asleep and did not hear her. Then she went to the home of Mrs. Bee but there, too, they were fast asleep and did not hear the knock. Only one place was left, Mrs. Ant's home. Her strength was fast leaving her as she was not used to the cold and she had had nothing to eat for several days. By the time she reached the ant's house she could only whisper, "Please give me something to eat—just a little bit and then I'll pay you back next summer." Mrs. Ant heard the grasshopper and went outside and helped her into her nice warm house. She fed her but the aid had come too late and Mrs. Grasshopper died but not before she realized that it is best to work as well as play.

THE SUN AND THE WIND.

One day the Sun and the Wind were arguing as to which was the stronger.

"I am the stronger," said the Wind. "I can do many things. I cover the ground with snow and freeze the water."

"I am stronger than you," said the Sun. "I warm the ground and make the plants grow. I melt the snow and the ice."

"I see a way to decide who is the stronger," said the Wind. "Here comes a man up the hill. He has on a heavy coat. The one who can make him take off the coat will be considered the stronger."

"Agreed," said the Sun. "You begin."

So the Sun went behind a cloud and the Wind began to blow as hard as he could upon the man.

"How cold it is," said the man. "That wind is so strong, I must hold my coat close or it will blow it off of me." And he fastened his coat up tight and the Wind, try as he would, could not make him take it off.

Then the sun came out and began to shine. He shone so warmly that the man said, "How warm it has gotten! This is a queer day. First it is cold, and then it is warm. This coat feels too heavy. I must take it off." And with that, he pulled off his coat and carried it on his arm on up the hill.

And so the argument was settled. Which was the stronger?

Aesop.

THE GOOSE THAT LAID THE GOLDEN EGG.

There was once a man who owned a very fine goose. Every day she laid an egg of gold and soon the man became rich.

As he grew rich, he grew greedy too. He said to himself, "The goose must be gold inside. I shall kill her and get all the gold at once and not have to wait for just one golden egg a day."

So he killed the goose but he found no gold. The man was very sad and wished that he had been content with the golden eggs.

A little is better than none at all.

Aesop.

THE HARE AND THE TORTOISE.

A hare was out in a field boasting that he could run faster than any one else. "I was never beaten in a race in my life," said he.

A tortoise was near by and he heard the hare. "I will run a race with you," he said.

This made the hare laugh as everyone knows that the tortoise is about the slowest thing there is.

"That is a good joke," said the hare. "I could dance around you all the way and then win."

But the tortoise was not to be daunted and so a goal was fixed. The hare was off with a bound and was soon out of sight. He looked around and not seeing the tortoise, he said, "That tortoise is so slow that I can take a nap and still get up and beat him."

This he did. The tortoise plodded along and soon passed where the hare was sleeping. But he did not stop. He kept right on going until he reached the goal.

By and by the hare awoke. He jumped up and ran as fast as he could. When he reached the goal, imagine his surprise when he saw the tortoise there before him.

Aesop.

THE RABBITS AND THE FROGS.

Some rabbits lived in the woods where there were many wild beasts. The rabbits were so bothered by them and so afraid of them that they did not know what to do. One day they were dreadfully frightened by some lions and one rabbit said to the rest, "We are so afraid of these large animals, let us jump into the river. It is better that we drown than to live in this continual state of fear. We shall be killed by them anyway, I am sure."

So the timid little rabbits ran as fast as they could to the river. As they approached it, a group of frogs who were sitting on the bank of the river, became frightened and jumped into the water.

The one rabbit again spoke, "The frogs are afraid of us. We are all afraid of anything bigger than we are." And they all ran back to the woods.

Aesop.

THE STAG IN THE LAKE.

One very hot day a stag came to quench his thirst at a lake. After he had taken his drink, he lingered to view himself from head to toe in the clear pool. The thing that he admired the most was his pair of beautiful antlers. "If only the rest of my body displayed the strength that is in these horns, how proud I would be," said he. "But, ah me! how slender are these poor legs of mine. I would almost rather have none."

Just then some men and their dogs who were hunting deer, came to the lake where the stag stood. Like a flash, he was off at full speed; and those legs, at which he had complained so much, soon took him far out of reach of the men and hounds. But the horns, of which he was so proud, caught in the branches of a low tree and held him there till the hounds came to pull him down.

Aesop.

THE CAT, THE MOUSE, AND THE COCK.

A young mouse who had taken his first trip away from home, came back in great haste and said, "Oh, Mother, I have had such a fright! While I was away to-day, I saw a horrible thing. It had such a fierce look and it strutted first here and then there and always on two feet. He wore a small red flag upon his head and another one at his throat and he would flap his arms up and down as if he would fly. But instead of flying, he would stretch out his head and scream at me with his sharp mouth and I thought he was going to eat me up. It made me shake from head to foot and I was very glad to run home as fast as my four legs would carry me. If he hadn't frightened me so, I should like to have stayed and made the acquaintance of the sweetest little soul. She had soft fur like ours but hers was a glossy black. She had four legs and a fine long tail that she would wave from side to side. She looked very meek and when she fixed her two bright eyes on me, I thought she wished to speak. But that terrible creature roared just then and I ran home."

"My dear child, it is well that you ran—not from the one you spoke of as he was only a rooster and would do you no harm but from the one you thought so sweet as she was a cat and cats eat all the mice they can catch. From now on do not be too hasty to judge by the looks."

Aesop.

THE BIRDS, THE BEASTS, AND THE BAT.

Once upon a time the birds and the beasts went to war. The bat—which could hardly be called a bird or a beast—stayed out of the way of both until he thought the beasts were winning the fight. Then he joined their ranks and to prove his right to be there, he said, "Look! Can you find a bird that has two rows of teeth in his head as I have?"

The war went on and the tide changed—the birds seemed to be the winning side. Then the bat joined their ranks. To them he said, "What else can I be but a bird since I have wings?"

This was not thought honorable by either the birds or the beasts and neither would own him and to this day he hides and skulks in caves and trunks of trees, coming out only at night after the birds of the air have gone to their nests and the beasts of the field are sound asleep.

One must always play the game fairly.

Aesop.

THE BOY AND THE NUTS.

A little boy once put his hand into a jar where his mother kept nuts and figs. He took all that his hand would hold but when he went to pull it out, he found that the neck of the jar was too small for him to do so. The little boy began to cry when he could not get the figs and nuts out. A friend standing near, said, "Grasp at but half, my child, and you will get it; but if you grasp at all, you are liable to lose all."

Aesop.

THE HORSE, THE WOLF, AND THE FOX.

It was a cold, snowy night and food was hard to find. A fox had searched everywhere but with no success. As he roamed around, he met a wolf who also was looking for food. To him, he said, "Do you see the horse in that field? I think if you would help me, I could kill him and we would both have a good meal." To this the wolf agreed. When they came up to the horse, the fox was surprised to see how much smaller he was than the horse.

"May I ask you your name and that of the man who owns you?" politely asked the fox. "My name is Prince but if you would know the name of my master you will have to see the stamp on the bottom of my shoe," replied the horse. The fox guessed what this would mean and said, "Oh, but I do not know how to read, but my friend here is smarter than I am and I am sure he can read it," and he bowed low to the wolf. The wolf was made quite vain by this flattering speech. He walked up close to the horse and bent his head low to read, but, alas! Prince gave a kick and that was the end of the wolf.

Do not ask of others what you would not do yourself.

Aesop.

THE FOX AND THE STORK.

One day as Mr. Fox was out for a walk, he met Mrs. Stork. He invited her to take dinner with him the following day. This she gladly agreed to do.

The fox thought he would have some fun and so he prepared some soup which he would serve in a flat plate.

The next day Mrs. Stork came all ready for a good dinner. There on the floor were two plates of soup. The fox lapped up his with his tongue but the stork could not get a drop with her bill. So the fox ate her soup, too.

"I am sorry you do not like your soup, Mrs. Stork," said the fox.

"Oh, that is all right, Mr. Fox. You must come to my house to dinner tomorrow."

When the fox came to the stork's house the next day, he found the dinner was meat served in long necked vases. The stork could get the meat with her long bill but the fox could but smell his. So Mrs. Stork ate hers and then the fox's meat, too.

"I am sorry you do not like the meat," said the stork. And the fox had to go home hungry as the stork had done the day before. A joke is never so much fun when played on yourself.

Aesop.

THE BOY AND THE WOLF.

A shepherd boy was watching some sheep in a pasture near the village. He had been told that there were wolves in the woods close by and that if any appeared, he was to call to the men to come. This day seemed particularly long and in an idle mood, he decided to see if the men would really come if he called.

He rushed toward the village and called as loudly as he could, "Wolf, wolf! The wolf has come!"

Quickly the men came, armed with guns and sticks to drive the wolf away. When they reached the field, they saw no wolf, so asked, "Where is the wolf?"

"There is no wolf," said the boy. "I only called out for fun." The men went back to the village.

The boy thought that he had had so much fun that he would try the trick again the next day. He called out, "The wolf! The wolf! Come quick for the wolf is here."

Again the men came running from the village and when they saw no wolf, they were angry with the boy for having fooled them again.

Then one day the wolf really did come and the boy called and called, "Oh, come quick! The wolf has really come!" But the men thinking that they would not be fooled again, heeded not. The boy tried to drive the wolf out but he was not able to and before long he had killed every sheep. The boy walked slowly back to the village. He had to tell the men that the wolf did come and had killed the sheep. The men were very angry and said, "How were we to know that you were not fooling us?" And the boy was never entrusted with sheep again.

Aesop.

THE FOX AND THE CROW.

A big black crow sat in a tree. She sniffed and said, "I smell cheese. It must be over in Farmer Brown's window. I shall fly over and see."

So spreading her wings, she went over to the pantry window, cawing as she flew. Sure enough! There was some cheese. She broke off a piece with her bill and flew back to the tree.

A fox came along, saw the crow and wanted the cheese she had. He sat down at the foot of the tree and said, "How handsome you are, Mrs. Crow! Your coat is such a glossy black and your feathers are so smooth."

The crow was pleased with what the fox said and she preened around that her feathers might shine all the more in the sun.

"I am sure that one with so much beauty must have a beautiful voice, too," went on the fox. "Will you not sing for me?"

Thinking that she must please the fox whom she looked upon now as her friend, the crow opened her mouth to say, "Caw" but as she did so she dropped the cheese. This is just what the fox wanted and he grabbed it up and ran off. As he went, he called back to the crow "Thank you for my dinner, Mrs. Crow."

Aesop.

THE CROW AND THE PITCHER.

One day a crow was thirsty. He looked around for some water but all he could find was in a pitcher. But it was down in the pitcher so far that he could not reach it with his bill. He tried to break the pitcher but he could not. Then he tried to turn it over so the water would run out but this, too, he was unable to do.

Finally he saw some pebbles on the ground close by. He picked up one and dropped it into the pitcher. He noticed that the water rose a little. Then he dropped in another pebble and the water rose still higher. So he dropped in another and another until the water came up where he could reach it and he drank all the water he wanted. So where there is a will, there is a way

5. MANUAL ACTIVITIES.

First there are the shells, scoops, and tin dishes for the sand table with which the children begin their play. Balls of various sizes and kinds, bean bags, some toys such as found in the home, and picture books supply the needs of the beginners and with these they have the first step in getting acquainted and learning to play in a group.

Pegs of the six colors of the rainbow—red, orange, yellow, green, blue, and violet—to put in peg boards. These boards are square with round holes in them. Sticks, natural or in the

six colors, ranging in length from one to five inches. Balls covered with worsted covers of the six shades.

Wooden beads for stringing on shoe laces. These beads come in the half inch and inch size, six colors, and shaped like cubes, balls, and cylinders.

Two inch wooden cubes, cylinders, and balls for rolling and building.

Wooden and paper parquetry in the six colors for design work. These are shaped in the diamond, the triangle, the square, and the circle.

Cardboard kaleidoscopes in the straight sticks, one to four inches long, and the half circle.

Mosaic cubes and round tiles for building.

Plasticine and clay flour for modeling.

Colored papers of the six standard colors for chain making.

Metal rings, circle, half circle, and quarter circle, for design work.

Inch straws and paper parquetry for stringing.

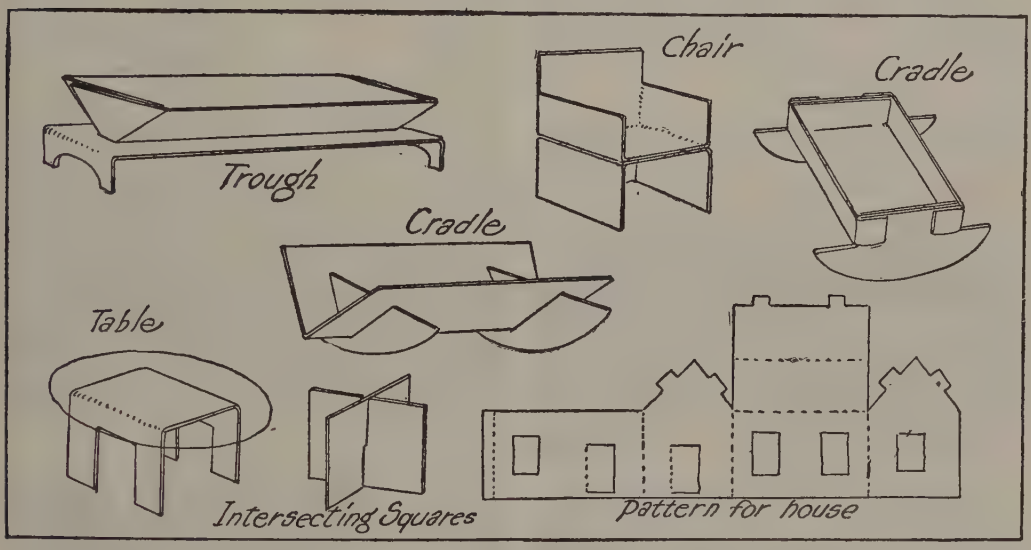
Mats and fringes of heavy paper for weaving.

Four by four and five by five inch square and round colored papers for folding boats, soldier hats, drinking cups, pin wheels, etc.

Drawing paper and colored crayons for free hand drawing as well as pattern work.

Watercolor paper, which is white and of a firmer grade, paint brushes, and watercolors for painting.

Thin white paper for free hand cutting and blunt pointed scissors.



Colored construction paper for making wheel barrows, baskets, wagons, boxes, furniture, etc. This grade is used for mounts also for the other papers.

Prick cards and sewing cards, yarn and heavy needles.

Stencil cards.

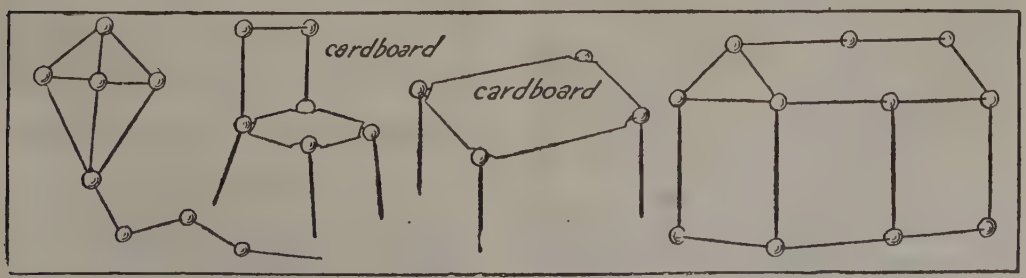
Puzzle pictures of birds and animals to put together.

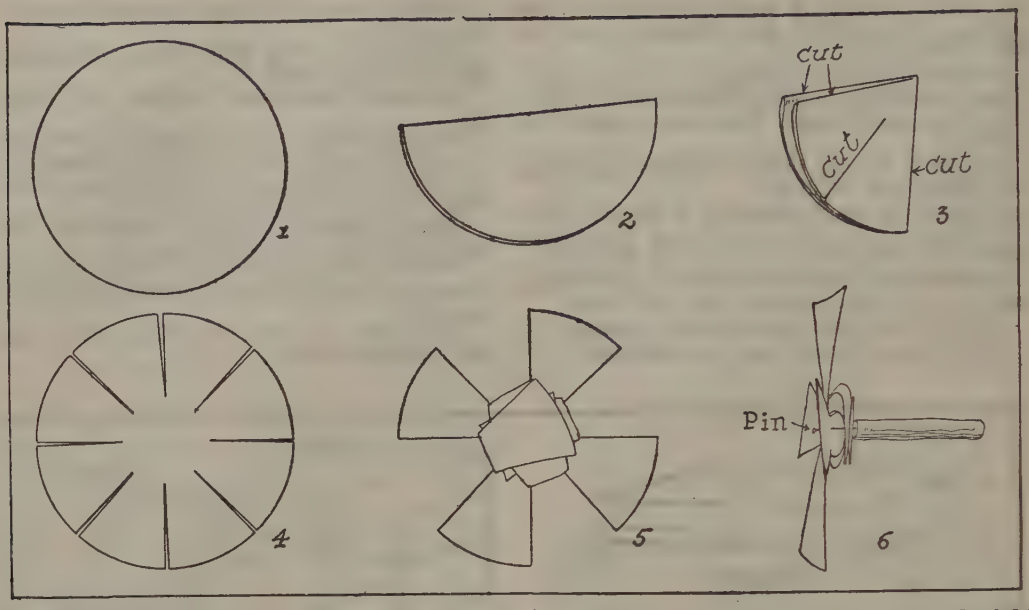
Magic Dot Cards and Dots. These cards contain pictures and are filled with little holes into which the colored dots are placed. These come in large and small sizes.

Paste, paste brushes, and individual paste jars for pasting the various pictures and the chains.

Square and round lentils in the six colors for design laying.

Seed peas and toothpicks for construction work. These peas must be soaked over night before using.





Pin Wheel—involving the following processes; drawing around a circle, folding, cutting, and pinning every other one to a round stick.

Gummed rings and strips for reproducing on mounting sheets the designs laid with sticks and rings.

Bradley's Straight Line cut-outs—these furnish pleasing material for first steps in paper cutting and construction, besides forming attractive borders for the room.

Boxes of blocks, the third gift, containing eight two-inch cubes; the fourth gift boxes with eight oblong blocks, one by two inch and two by four inch sizes; the fifth gift boxes containing more cubes and some that are divided diagonally into halves; the sixth gift boxes with oblong blocks and some that are divided crosswise and lengthwise, and the curvilinear gift boxes containing the divided cylinder and thus gives half rings and quarter rings of sufficient depth to produce the effect of arches.

6. Method of Using the Materials.

The first use of the materials should be experimental with no suggestions from the outside. The child likes to feel them and to try his own ideas even though this be little more than laying the blocks, etc., out in a row in front of him or letting the sand sift through his fingers.

After he has become acquainted with the materials, some phase of a story that has been read or some of the talks will suggest to his mind something to construct. Be sure to let him carry out his own ideas rather than to copy from the idea of an adult. By questions and suggestions these ideas can be further developed and the result more satisfactory. In an amazingly short time one will be surprised to see the improvement and the really complicated construction that they are able to carry out.

In the Indian project, many of the materials will lend themselves to the construction of the wigwams, the canoes, and the Pilgrims' log houses. Group building will enlarge the structures and the talking over of the thing to be built will develop new angles and bring it nearer perfection. So with other projects.

The sand table furnishes the best group work and each strives to add something to the project being worked out. They know that only the best will be used in it and this stirs them on to develop fineness in their work.

Rings, sticks, and tablets may be used for flat pictures. Many artistic designs are developed which aid the idea of symmetry. With the rings and sticks, life forms are constructed which can be used as patterns from which to draw and color.

The prick cards and stencils are not aids to creative self activity but they help to train the child in the sense of direction and by the connection of points or lines to form a picture.

The plasticine and clay as well as the cut-out pictures furnish the material for the child to take home. The thought of making a picture or present for Mother always appeals to the child and brings forth his best efforts.

The pegs and the sticks give the first step for little number stories which is an aid toward the First Grade.

The folding lessons should be by dictation which serves as a great help in gaining attention and in developing the ability to construct by direction rather than from a pattern.

7. Outline of the Year's Work by the Month.

SEPTEMBER.

Great big trunks packed to the brims;
Worn-out shoes; hats without brims;
Faces brown with sun and weather;
Clothes grown small—scarce hook together.

Journeys home 'mid lots of fun;
Thoughts of school that's just begun;
Lots of lessons to remember
Cooler days—and that's September.

Youth's Companion.

TOPICS.

THE HOME-HARVEST-FRUIT-VEGETABLES.

The child has just left the home and naturally that and all it implies holds first importance in his mind. So the first talks should be on Home—what the home is like—the family with its various members—the pets—the playthings—the occupation of the father—the neighborhood.

What the home is like—In this talk the child is led to tell what the house is like, how arranged inside, etc. The color of the house is brought out here. Great interest is manifested in where the child plays and each one tells what they play at home.

The members of the family—Mother is foremost here and many talks are developed as to her different tasks. "Here We Go Round the Mulberry Bush," is a good game to illustrate some of her duties. The baby comes next—what does mother do for him; what can the child do? He can sing the baby to sleep—Bye Baby Bunting being a good lullaby song and a new one can be taught. Then the rest of the family come in for their share.

The pets—Many conversations can be had about the various pets, their habits, their care, and their plays. Maybe some child has a pony and Dusty Bob makes an interesting singing game.

The playthings or toys at home—Have the children bring their favorite toy and demonstrate how the various ones work. The many colored balls will be one of the most popular and a test for color distinction can be made.

The occupation of the father—Perhaps one father will prove to be a carpenter and the talk can be on how he builds the house. Building blocks and other gift material afford an unlimited scope for the child's imagination here and the work of their little hands is often a work of art.

The neighborhood—Here the child tells of his playmates. He also makes many comparisons. The formation game is a neighborly game.

The harvest—Talk about the effect of the sun and rain on the corn and wheat that grows on the farm. The children have taken rides into the country and have noticed how the grains look at this season and how they differ from the same kind during the spring and summer. Kernels of corn and wheat should be shown to them and then a full grown ear of corn and a bunch of wheat. Then tell them that the farmer cuts down the grains and gets it ready for winter use. The various activities of threshing time come in here and are highly interesting to the child. Flour and cornmeal can be shown and this leads to the introduction of where the grains are ground and the life of the miller is developed. The dramatization of The Little Red Hen is good to show the different steps of the growth and development of the grain of wheat.

The fruits and vegetables—Have fruits and vegetables on hand and let the children distinguish between them. Call attention to the way the fruit tree looked in the spring and the way it looks at this season of the year. Develop the fruit from the blossom to the mature fruit and in this development call attention to the trees' friends, such as certain birds that destroy the harmful insects that blight the trees. With the vegetables observe that in some kinds, the part we eat grows under the ground and let the children name the kinds they know.

STORIES.

Familiar stories should be used a great deal this month. The Three Bears is popular and should be dramatized, allowing the children to choose the materials to be used and how. Care must be taken to have correct expression and lead the child from its own vernacular without causing self consciousness.

The Little Red Hen, as stated before, furnishes a good example of how the wheat is raised and cared for.

The Little White Rabbit and The Fox and the Grapes are good fall stories as acorns and grapes are ripe at this season.

GAMES.

The Farmer in the Dell.

Ring Around the Rosy or London Bridge Is Falling Down for old familiar ones which, like the stories, must be used to lead the child from the known to the unknown.

Here We Go Round the Mulberry Bush.

The circle ball game as given in the games, acquaints the children with each other's names.

Where's My Kitty, for a sense game.

Adam's Sons, for imitation.

SONGS.

Good Morning to You.
The Farmyard.
Piggy Wig.
Here's a Ball for Baby.

Jack and Jill and some other Mother Goose songs as the words are already familiar to the child.

MANUAL ACTIVITIES.

Various balls—the large water balls for the Ball Game mentioned before; the spectrum colored balls for the teaching of the colors (having the children name the color whether the balls are distributed or collected).

The small wooden balls may be used to roll at targets such as the ten pins or buildings made of blocks.

The colored wooden beads are strung on shoe laces and are arranged according to color at first and then when the colors are learned the child may arrange in any rhythmic order, and many times very interesting strings are designed.

With crayons and scissors, balls are cut and colored, using the six primary colors. From the round ball the apple grows, also the peach. Then the pear follows with the round base. Fruit baskets can be arranged—some free hand and others done by cutting a pattern. The various vegetables are cut and colored and arranged in various kinds of pictures in which pasting is another activity.

Pegs are used a great deal, with and without the peg boards. Color arrangement is carried out here again.

The sand table affords free play for the child. The construction of hills and houses is the main theme followed.

Plasticine is used to make the balls, fruits, and vegetables or the many things as suggested by the stories. For the Three Bears the chairs, beds, and bowls are made—crude, of course, in the beginning but improving with practice.

Blocks are used to construct the *home* after a certain amount of free play with them in which skill in handling has been acquired.

Free hand drawing of the fall flowers develops the art instinct. A sense of proportion is developed in this. The salvia, goldenrod, and wire grass are good subjects. These drawings should be developed from the flowers themselves and done with the colored crayons.

OCTOBER.

"Come, little leaves," said the wind one day.
"Come o'er the meadows with me and play;
Put on your dresses of red and gold,—
Summer is gone and the days grow cold."

George Cooper

TOPICS.

THE LEAVES—NUTS—THE PREPARATION OF BIRDS, ANIMALS, AND TREES FOR WINTER.

The Leaves.

Draw the children's attention to the new month. The leaves are now changing color and each little leaf puts on its Autumn dress. Some have red dresses, some yellow, some brown, and others have golden ones. Then the wind comes along and invites them to leave Mother Tree and to go with him for a play and he sends them whirling over the fields. They have work to do too. The little flowers that have been blooming all summer, have gone but their little roots stay in the ground and must be kept warm. So the little leaves cover them over with a bright blanket and when Jack Frost comes he is not able to harm them. Then when winter comes, the snow falls over all and makes another cover for the sleeping flowers.

The Nuts.

Not only have the leaves left Mother Tree but various nuts have fallen to the ground. Show if possible, the different kinds of nuts and the houses that they lived in until Jack Frost tapped at the door. It is very interesting to the child to see the many ways Mother Nature has provided for the little nuts in the way of houses. For instance—the prickly chestnut burr is lined with *velvet* and has rooms for three nuts. Some of these nuts will be gathered by children, others by squirrels for their winter storehouse and some will be left on the ground and like the leaves, they sleep through the long winter under the blanket of snow and when spring comes they burst their little coats and send their roots down into the ground which later shoot up into trees.

Preparation for Winter.

It is at this season of the year that the birds must think of going to a warmer home. The leaves have fallen from the trees and they no longer offer shelter from the wind. The flower seeds have scattered and food is getting scarce. So in October one sees many flocks of birds starting south. There are some, however, who brave the rigors of winter and it is for these that we should be ever mindful and throw bread crumbs and other food where they can get it.

The caterpillar has provided for himself and has built himself a home. Cocoons should be gathered and explained to the children and kept in the room to watch developments and see the lovely butterflies as they emerge from them in the early summer. The study of the silkworm is taken up here too as it is so closely related.

All the furry animals are provided by Mother Nature with an extra heavy coat. Then they in turn must provide their winter store. Many gather nuts and store them away, as in the case of the squirrel. The bear goes into a cave and sleeps the winter through.

The trees have been busy all summer and now comes their time to rest. The leaves have been taking care of very tiny buds but now they have flown away to cover the flower seed and nuts and the baby buds must put on a heavy winter dress, a varnish, under which they will sleep until the warm sun awakes them and it is time for them to grow into leaves.

Hallowe'en preparations occupy the last week and much interest is manifested in the first party of the year.

STORIES.

The North Wind at Play—in Miss Poulsson's Book.

The Thrifty Squirrel—in In the Child's World.

The Baby Buds' Winter Clothes—in In the Child's World.

The Little Rabbit—in this volume.

The Squirrels' Harvest—in Half a Hundred Stories.

Mother West Wind Stories by Thornton Burgess.

GAMES.

The Leaves Are Green.
The Little Gray Squirrel.
The Lost Child—sense game for hearing.
Fly Away.
Finding the Chalk by Music.

SONGS.

Milkweed Babies.
Autumn Leaves.
Numbering the Fingers—in Frobel's "Mother Play."

Wee Willie Winkie
The Crooked Man
Little Tommy Twig
} Actions given suitable to the words as given in the poem section of this volume.

RHYTHMS.

Rhymatic exercises are introduced this month and are added to each month as they appeal greatly to the child and help him on expressing himself by means of physical action. The march is the first rhythm taught from which is developed the soldier march. The skip follows

this. Then the flying birds which signify the migration of the birds south. For dramatized action we have for this month the bending trees; the falling leaves which are twirled about by the wind and then fall softly to the ground for their long winter nap; the squirrels gathering nuts and storing them away, and bicycle riding.

MANUAL ACTIVITIES.

Colored leaves should be collected and pressed. Then a thin varnish is applied and the leaves are ready to paste in designs. Or a leaf is marked on paper and then colored the autumn colors.

Purple circles are arranged in clusters for grapes.

Many colored circles are used for balloons that one sees at the fair. A man is cut and colored and these circles arranged on lines (strings) and fastened to the man's hand.

Beads have been popular and now one can add the stringing of beans, peas, or pumpkin seeds which the children delight in bringing from home.

Seed peas put to soak can be utilized with toothpicks to make kites and furniture.

For Hallowe'en, pumpkins may be cut out and colored with eyes, nose, and mouth. Witches, owls, and cats can be cut from black paper and posted around the room for decoration.

Pumpkins and Jack-O-Lanterns are made from the plasticine.

Paper lanterns are made by cutting a folded paper (6 by 9) in strips one half inch wide and leaving them joined at the open sides. Then the paper is opened out and the strips colored in the different colors. This completed, the lantern is rolled around and joined by pasting and then a handle is added.

Paper chains make a very good pasting lesson and form decoration for the usual Hallowe'en party.

NOVEMBER.

It is cold and still,
The wind is away,
And Little Jack Frost
Is busy at play.
He nips my cheeks—
He nips my nose,
But before I can catch him
Away he goes.
Jack Frost! Jack Frost!
You queer little elf!
Where do you go when you hide yourself?

Alys E. Bentley,
A. S. Barnes Co.

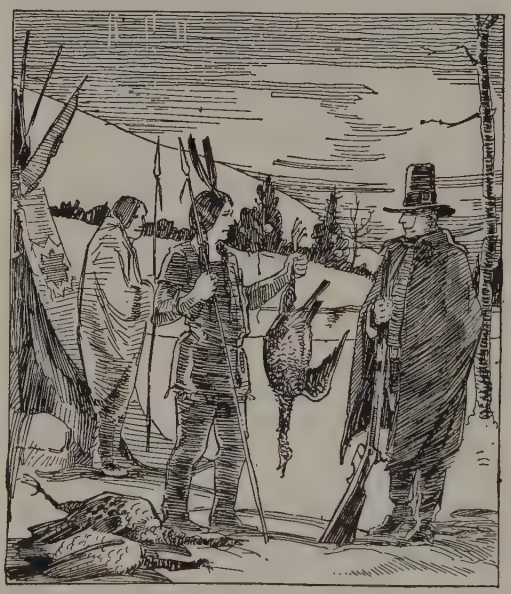
TOPICS.

The Indians.

No subject proves more interesting than the first men of our land. The personal appearance of the Indian is taken up first—the red skin, high cheekbones, black eyes, and coarse straight black hair. Then the dress—suits were made by the squaws out of deerskin and sewed together with small strips of skin in a bone needle. The shoes, or moccasins, were made of deerskin too and ornamented with shells. The boys and girls dressed very much the same. The father wore feathers in his hair and strings of shells around his neck. The children love to bring their modern day moccasins for display and will like to wear their Indian suits.

The home of the Indian is talked of next. Small trees were cut down by the squaws and put in the ground in a circle. These were brought together at the top and bound with a strip of skin. Around this, large buffalo skins were placed with just a small opening for the door. Over this door was fastened a small skin to shut out the cold. In the center of the wigwam, as the tent is called, a hole was hollowed out for the fire. This furnished the heat and the light for the home as well as being used for cooking when the weather did not permit of cooking outdoors.

While the woman built the wigwam and cooked the food, the man or warrior, hunted game—such as buffalo, deer, and small game with his bow and arrows. He was also the fighter. He made the canoes out of birch bark and the large boats out of a large log which he hollowed out by means of first burning and then scraping.



INDIANS—THANKSGIVING.

Several families of Indians lived in a group and belonged to a tribe. When game and food became scarce, the tribe packed their belongings and fastened them on the ponies and all sought a new place where there was running water and plenty of food for both the Indians and the ponies. The women did all of the packing of the wigwams and things and then when the new home was reached, they again set everything to rights.

Long, long ago there were no white men in this country and the Indian reigned supreme—no houses—no stores. Everywhere were woods and prairies. This now leads to the introduction of the white man.

Thanksgiving.

In England the King wished all the people to pray to God as he did and if they did not they

were punished. There were some people who did not like this and so decided to leave England and go to Holland and live with the Dutch people and there they could attend whatever church they wished. This they did and were very well satisfied for a time. But as their children grew up they had adopted Dutch ways and this was not to the liking of the English people. They had heard of the new country called America and they decided they would brave the ocean and go there to make their home. They got two boats, the Mayflower and the Speedwell, and all started for what is now our land. They had not gone far until the Speedwell broke down and they returned to England for repairs. It could not be fixed, so all that could crowded into the Mayflower and once more started on their way. These people were called Pilgrims which means Wanderers.

The trip in the sail boat was a long and tiresome one and all grew very restless. A baby was born on the trip and was called Oceanus and he helped to pass the time for the little children. At last a day came when land was sighted and there was great rejoicing. But there were no comfortable homes waiting for them—nothing but a bleak coast with woods beyond in which many perils lurked. The men landed first and had to build crude log houses before the women and children could go ashore. And among the first buildings to be constructed was a church.

The first winter for these Puritans was a very hard one and with so many privations, many sickened and died and when spring came only about half of the number were living. They had met some friendly Indians and they showed the white man how to plant corn. In the fall, with God's help, the Puritans had a plenteous harvest. They had better homes and more people had joined them from England. So the white people decided to set a day aside to thank God for his blessings and this was the first Thanksgiving. The friendly Indians were invited to the feast and their contribution to it was fluffy white popcorn—the first the white people had ever tasted. But before partaking of the feast, these people assembled at the church and prayed to God and thanked him for all. This first Thanksgiving lasted three whole days.

STORIES.

The Elves and the Shoemaker—a thanksgiving story.
Billy Bob-Tail.
Peter Pan.
Thanksgiving story in Miss Wiltse's "Kindergarten Morning Talks and Stories."
The Little Snow-Girl adapted from Hawthorne's Wonder Book.

GAMES.

The Hen and the Chicks.
Simon Says.
The Farmer and the Chickens.
Sense game as given in (c) of Games.
Skip Tag.

SONGS.

Jack Frost.
Thanksgiving.
Mother Goose Songs.
Winter Song.
The Disappointed Snowflakes.

RHYTHMS.

Jack in the Box.
Galloping Horses.
Brownies.
Indian Dance.

MANUAL ACTIVITIES.

The sand table has been used for free play up to this time but now the children will be interested in developing an Indian display. Canoes, wigwams, Indians, and ponies can be made of stiff paper and made to stand in the sand. One end can be reserved for the Puritans and their log houses.

Cutting and coloring of the turkey.
Clay modeling of the canoe and the wigwam.
Building of forts with blocks.
Stringing of straws and paper parquetry.

DECEMBER.

"A little fir grew in the midst of the wood,
Oh, there in his evergreen dress he stood.
His branches were sweet with the balsam smell,
His needles were green where the snow fell,
And always contented and happy was he—
The very best kind of a Christmas tree."

Henry Van Dyke.

TOPICS.

Preparation for Christmas.

Review of why we have a Thanksgiving day—yes; it is to thank the Heavenly Father for all the blessings we enjoy. What month does Thanksgiving come in? Yes; November. And now we are in another month, a month that should be the happiest of all the months. This month gives us the day that the Heavenly Father sent us that which we thank Him most for. This day is the birthday of Christ. Tell the story of the first Christmas, and why it is called "Christmas Day." Show pictures of the Christ-child in the manger, also of the wise men and the shepherds.

The true spirit of giving should be presented to the children. We give because we love those for whom we are working and we want to make them happy. So we give to each other on Christmas Day because it was on that day that the Heavenly Father gave us the Christ-child. The children want to make gifts for their father and mother as they are the ones they love best and preparations are made for an entertainment on the last day of school before the holidays.

Many talks are had upon Santa Claus and the thought of his love for the children is the motive for his lavish giving. Toylands are visited and much free talk is given on the toys seen there—how they work, etc. The children imitate the mechanical action of the various toys

STORIES.

The Night Before Christmas.
Christmas at the Lighthouse.
The Little Fir Tree.
The Bird's Christmas—In the Child's World.
Santa Claus and the Mouse.
The Story of the Christ Child.
Little Piccola.

GAMES.

Pinning candles on a Christmas Tree and seeing who can pin one at the top. Eyes blindfolded.

Santa Claus and His Bells—played the same as the Hen and Chicks with "Merry Christmas" substituted for "Cluck" and "Tinkle, tinkle" for "Peep, peep."

Musical Chair.

SONGS.

Round and Round the Christmas Tree.
Little Jack Horner.
Kris Kringle.
Holy Night, Silent Night.
Away in a Manger.
Santa Claus So Jolly.
Jingle, Jingle, Tiny Bells.

RHYTHMS.

For dramatization of action use the various toys as—beating drums, blowing horns, sliding on sleds, etc.

The long stride of the giants.
Rocking Dolly to sleep.
Riding a Rocking Horse.

MANUAL ACTIVITIES.

For the room and tree decorations,. make chains of holly leaves fastened together, these to be cut and colored by the children. Also make Christmas bells out of red cardboard. Chains can be made of small pieces of spaghetti and cranberries.

For the gifts—calendars can be made by coloring anything appropriate to Christmas and mounting on a red or green mount with a little calendar pad pasted just below; blotters can be had by making a fancy cover and fastening it to a piece of blotting paper with a ribbon, 4 by 6 is a convenient size; candle shades with the design on each of the four sides cut out and a tissue paper mounted underneath for a facing; needle books; pen wipers, a colored design combined with red flannel; a telephone list with a Christmas design at the top; a memorandum book, and many other simple useful things that little hands can make.

The sand table is fixed up for Santa Claus Land using sheet wadding for the snow. His house can be constructed of blocks and the work of making a sleigh, reindeers, and toys will make fine occupation for the children.

Out of parquetry and rings many toys are constructed. Plasticine is used in a free construction, too.

Considerable time is used in the learning of little songs and verses for the first *real* entertainment when *Santa Claus* will come and the tree will have many surprises for them.

JANUARY.

"Late lies the wintry sun abed,
A frosty, fiery sleepy head,
Blinks but an hour or two and then,
A blood-red orange, sets again."

R. L. Stevenson.

TOPICS.

The New Year—The Eskimos.

The New Year—Always the New Year brings with it new resolutions and each child will be glad to tell of one thing in which he or she intends to do differently. Some may resolve to keep their hands and face clean, some to come to school every day and to be on time, others to obey when spoken to either at home or at school, and some one else to not be rude and talk when others are talking. In this New Year talk, a survey is made of the different things that the children have learned up to date.

The Eskimos—The children are very interested in the study of the people that live up in the cold north—which means almost Santa land to them. First the appearance of the Eskimo is considered—coarse black hair, black eyes set in a round, yellow face, and they are of short, heavy-set stature. The dress, made by the mothers, consists of two suits of fur, one with the fur turned inside and one with the fur turned outside. The hoods and leggings, likewise, are made of fur and the shoes (kamiks) are made of skins. All dress much the same and one would have difficulty in telling which were the boys and which the girls. Their winter home is made of stone since there are no trees that far north and consequently no wood except driftwood that is washed ashore from some wrecked ship. The house has three parts to it—a large round room where the Eskimos sit, eat, and sleep. The next part is a long low tunnel and at the other end of this is a small round room which is built to keep out the cold. In this is the doorway which is a small round hole which necessitates the Eskimos dropping down on their hands and knees to enter. The stones of the igloo, as the house is called, are put together with moss and covered over with snow that is patted down by means of their snow shovels. In contrast to the Indian, the Eskimo men build these houses. In the room where the Eskimos live there is a bench at one side, often of ice, and this is used as the bed at night and to sit on during the day. A stone lamp filled with whale oil and moss as a wick is used for lighting and heating the igloo as well as for cooking the meat that they do not eat raw. In the summer the Eskimos leave this stone house after opening up the top to let the sun clean house for them in their absence and they journey to a new spot and pitch tents made of skins of the musk ox. The women set up the summer home.

It being so cold in this far away land, the Eskimos have no vegetables and so live on meat and fish. When a bear or a whale is caught by one man of the Eskimo village, the women cut it up and it is passed around to all the families. One sweet morsel to the children, such as candy to our children, is the layer of fat that comes under the skin of the whale which is called blubber. They like to eat this raw. Fishes' eyes are another choice tidbit.

The Eskimos have no horses but dogs carry them about. The fathers usually have a sled made from driftwood and to this are hitched from ten to twenty dogs and it is remarkable to know how rapidly they can travel over the snow. Driftwood is too scarce for the children's

sleds so they are made from blocks of ice. At an early age the little boys learn to drive dogs, to hunt with bow and arrow, and to fish. The Eskimos know that without constant hunting for food, the extreme cold would soon make an end to them. In the summer they catch many fish and dry for winter use and walruses, seals, bears, and deer, caught through the summers, are cut up and placed in storage to guard against the time when it might be impossible to secure food. The big snow storms of the winter often shut them in for many days at a time.

The Eskimo men have each a small boat similar to the canoe of the Indian. In this, the man pulls a skin coat over him and then even if he turns clear over in the water, he can not get water in the boat. Such a boat is called a kyak. For changing their abode in the summer, large "Women Boats" are used.

The dark day of the winter and the light night of the summer is an interesting study. Half of the year it is night most of the time and the other part it is day. The Eskimos have no clocks and so they reckon time by *"sleeps."*

These people are great believers in signs. They believe the Northern Lights to be the spirits of children dancing in the sky. If they are not industrious and thrifty, they think the giants who live at the edge of the world will come and get them. If a bear is killed, his head is kept for five days and their belief is that then the spirit of the bear goes to the land where the relatives of the Eskimos' live who have passed away.

Bean Bag Relay Race.

SONGS.

New Year Greeting.
Eskimo Song.
The Clocks.
Dolly's Lying in the Closet.
Day and Night.

RHYTHMS.

Snowflakes.
The Bears.

MANUAL ACTIVITIES.

The presents that the children received for Christmas are still very important and they love to tell about them. They should be allowed to bring some of them to school and show others how they work. Then pictures can be made of the more simple ones, such as the horns, drums, etc.

Snow pictures should be made. The sky is colored blue if for daylight and gray if for night. The snow is made by tearing a piece of white paper to represent an uneven horizon line and then pasted on the mount. A snow man can be built up of various sized circles and the eyes, nose, mouth, buttons, and stick hands being added by means of black crayolas. Skeleton trees, colored black, and a yellow moon make good night pictures. Rabbits jumping in the moonlight on the snow is another suggestion. Boys rolling up large snow-balls can be cut from a pattern, colored and pasted on a snow mount.

Plasticine makes wonderful snow men.

Many pictures of the Eskimos are made. The children delight in making the little Eskimos of construction paper and covering all but his face with sheet wadding to represent fur. The igloo is also covered with the cotton for snow. These pictures can be made very artistic and are of great value in impressing the study of the Eskimo upon their minds.. An iceberg or two should be shown as well as some of the animals that live in that region.

The sand table furnishes good material for working out Eskimo land. Cotton and the artificial snow that one gets at Christmas time add much in making realistic effect.

Stick laying—making simple things as snow shovels, sleds, etc.

FEBRUARY.

"There are many flags of many lands,
There are flags of every hue;
But there is no flag, however grand,
Like our own Red, White, and Blue."

TOPICS.

LINCOLN—VALENTINE'S DAY—THE POSTMAN—WASHINGTON.

Lincoln—A story of his life in a simple way should be told to the children and various pictures of him shown so as to impress on their minds the type of man he was. The story of his great desire for learning and the many handicaps that he had to overcome to attain his ambition—the meagerness of their home and circumstances—the rise from a rail-splitter to clerk in a grocery store, then to being a lawyer, and thence to President of our United States—the Civil War and its cause which happened during his term of office—and his untimely death are all topics of interest if told in a child's vocabulary.

Valentine's Day—A little talk on the subject of sending valentines to one another—to show our love.

The Postman—At Valentine time we are very interested in the Postman that delivers the missives or the clerks in the Post Office who hand them out if the town is not large enough to have city delivery. No matter the weather, the postman is always on hand. From him, we go back to a brief study of the Office and of how the mail reaches there and is taken care of. An excursion to the Post Office proves of great value in seeing how much attends the delivering of one Valentine to your door or the sending of one.

Washington—Here again as with Lincoln,

simple story is given of his life and a comparison can be made of the two homes and environment by means of many pictures. Washington's people had the very thing that Lincoln opposed—slaves—but at that time it was thought nothing of. The rise of Washington was more rapid, going from surveyor to the leader of the army during the Revolutionary War and then to the Presidency of the United States.

"First in War,
First in Peace,
And first in the hearts of his Countrymen."

STORIES.

Stories about Lincoln and Washington.
Philip's Valentine—in "In the Child's World."
The Three Pigs.
Androcles.
The Lion and the Mouse.

GAMES.

Soldier Boy.
Chalk game as given in (i) of this volume.
Automobile Game.

SONGS.

America.
George Washington.
Abraham Lincoln.
A Pretty Way.
Flag Of Our Country.
A Valentine.
The Star Spangled Banner.
Soldier Boys.

RHYTHMS.

A Soldier's March—Soldier hats and flags should figure in this. At the conclusion of the march, the flag salute should be given.

"I give my hand,
I give my head,
I give my heart to my countrymen.
One God, one country, and one flag."

An orchestra can be added in which some play their horns and drums and one is chosen to carry the baton and to lead them. The teacher should play a soldier march and while the children will not add to the musical side they will develop a rhythmic sense.

MANUAL ACTIVITIES.

A log cabin can be built of sticks for Lincoln's home.

Then one can be drawn upon paper and colored. A silhouette of Lincoln's face should be made and pasted upon a shield of red, white, and blue.

Valentines for the fourteenth take considerable time as the envelopes are to be made as well. Then a mail box must be covered for the collection of valentines for each other which are given out on that day. Postmen are selected to deliver the valentines to their make believe house (chairs arranged in rows as though they were houses on different streets). So for this, mail bags must be made for the postmen. These can be made by sewing two large pieces of paper together.

For Washington's birthday we will want to make a flag. The first results will be rather discouraging but with repeated attempts, the children will be better able to keep their red coloring within the right lines. Soldier hats should be made by folding. As for Lincoln, a silhouette of Washington should be made. Pictures of Washington as a little soldier boy and as a boy cutting down the cherry tree (a story that every child is familiar with) can be constructed by a cutting, coloring and pasting lesson.

The sand table can be brought into use again for a soldier picture. Tents can be folded, soldiers cut out and fastened on sticks to stand in the sand as on parade. Flags should be colored to adorn the forts.

MARCH.

"Weather-cock, what makes you go
Round and round the whole day so?"
"'Tis the wind whirls me!
'Tis the wind twirls me!
So to all the world I show
How the merry wind doth go."

(From the German).

TOPICS.

THE DUTCH PEOPLE—THE MILLER—THE CIRCULATION OF SAP IN THE MAPLE TREES—THE PUSSY WILLOW.

The Dutch People—March is our windy month and it makes one think of the country where the wind is put to a great deal of use—Holland. Here the wind is needed to make the myriads of windmills go around that are so necessary to keep the land from being flooded.

The people of Holland are fair skinned, with yellow hair and blue eyes. The little girl wears her hair in two long braids down her back while the boy wears his in a bob. Like us, the Dutch boys and girls dress differently. The girl wears a spotless white blouse with a broad girdle of velvet which laces up the front. Her skirt is very full and comes down to the ankles. It is usually made of some bright woolen material. The Dutch people are fond of bright colors. Then the girl wears a lace or a starched linen cap that has points out at each side. The boys wear velveteen jackets that are short and are fastened together with large brass buttons and in the case the father is very rich these buttons are of gold. His trousers are long and baggy, being brought into a band at the ankles. His cap is a little round cloth affair. On the children's feet are woolen stockings that the mother knits and then wooden shoes. They would seem most awkward to us but these Dutch boys and girls can klump along very fast over the cobble stone

The homes are made of brick and are very tall, running to a high gable. Sometimes the houses are six stories high but the top stories are very narrow. The houses are painted bright colors with white door and window casings. The roofs are of red tile. The floor inside is likewise of tile which is kept spotless. The children before entering the house remove their shoes and go around in their heavy woolen stockings. The housewife in Holland is a very industrious type and every thing in the house is kept as neat as a pin. Dutch Cleanser that your mother uses to clean with was so called because it is characteristic of the Dutch to chase away dirt.

The country of Holland is lower than the ocean and so huge walls have to be built to keep the sea from flooding the land. These walls, called dikes, are made of crushed rock and dirt and are wide enough at the top to make a road. Along the dikes are stationed little houses in which men live who watch the dike that no leak comes in it. If one is discovered, a bell is rung as we ring a bell for fire and the men rush to that place to repair it before the water sweeps over the land. Because of the lowness of the land windmills are constantly kept at work to pump water off the land into canals which carry it into the sea through the sluices. These canals are made by digging wide ditches and are used as streets in many places, the people going back and forth to their work or school by means of boats in the summer and skates in the winter when the canals are frozen over.

The windmills have other duties to perform too. They crush the rock for the dikes and grind the wheat and corn for food. They, like the houses, are painted bright colors with snowy white sails and must add much to the picturesqueness of the scenery.

The Dutch are great lovers of flowers and their two favorites are the tulip and the hyacinth. They raise large fields of these and have worked and worked until they have some types that are seen nowhere else. For instance, they have succeeded in raising a black tulip.

In winter skating is a great pastime, grandma and grandpa as well as the children enjoying the sport. The women skate to market with their basket on their heads. In the evening they often have skating festivals. At this time all kinds of fancy sleds and ice boats are displayed. Lights are attached to many and it is quite a beautiful sight.

As in Greenland where the Eskimos live, the dog is used as a horse. In Holland they are made to pull the milk wagons and to carry back and forth to market. One does not see so many horses. But in the meadows cows graze and from their milk, butter and cheese are made.

The stork is a native of Holland and it is no uncommon sight to see their crude nests built upon the tops of the houses. The Dutch like it so. The storks are often seen about the market house picking up the refuse which helps to keep the market clean.

The Miller—From the study of the Dutch people we have found out how their flour is made and that leads us to discover how ours is made. Here the farmer takes his wheat and corn to a mill whose big wheel is turned by the river close by or to a mill that has a great deal of machinery which cleans the grain and grinds it into flour. Show the children the bran that comes from the wheat as well as the flour. An excursion to a mill and its dusty miller is very educative.

The Circulation of Sap in the Maple—We know that spring is on her way by the moist appearance of the maple tree. Explain the process of sugar-making to the children. Suggestions for this talk can be found in "In the Child's World."

The Pussy Willow.—Find if the children have seen anything that would make them think that Mistress Spring was on her way back after her winter down south. The snow melting will be one answer and they have just learned that the moist appearance of the trees shows that spring is near. Yes, maybe some child will bring a sprig of pussy willow. Call their attention to the nice warm dress that pussy has and so she will not mind the cold March winds. While March is one of our spring months, still Jack Frost returns now and then for a visit but unlike in the winter, he does not stay long at a time now.

STORIES.

Little Peter of Holland.
The Mother Stork.
The Maple Tree's Surprise—"In the Child's World."
Charlotte and the Ten Dwarfs.
The Wind—a poem to learn.

GAMES.

Rabbit in the Hollow.
Modes of Travel.
Dutch Dance—Mari Hofer's Folk Dance Book.

SONGS.

The Wind.
The Children of Holland.
The Song of the Trades—with "miller" supplied.
The Pigeons.
Pussy Willow.
The Windmill—by Inez Gordon Brown in The Kindergarten and First Grade Magazine, published by Milton Bradley & Co.

MANUAL ACTIVITIES.

For the Dutch many pictures can be attractively arranged, showing blue sky and blue water, brown strips pasted so as to represent the dikes, the bright colored windmill by the water, and the Dutch boy or girl. Others can show the Dutch house and the stork at the top by the chimney. A boy or girl with tulips which are an easy flower for children to make, a girl with her geese, and any other arrangement that one may desire.

With sticks the Dutch house can be constructed and also the windmill.

The sand table lends itself beautifully for making a Dutch picture.

Free hand drawings of maple trees with a pail catching the sap as it runs out of the improvised spout.

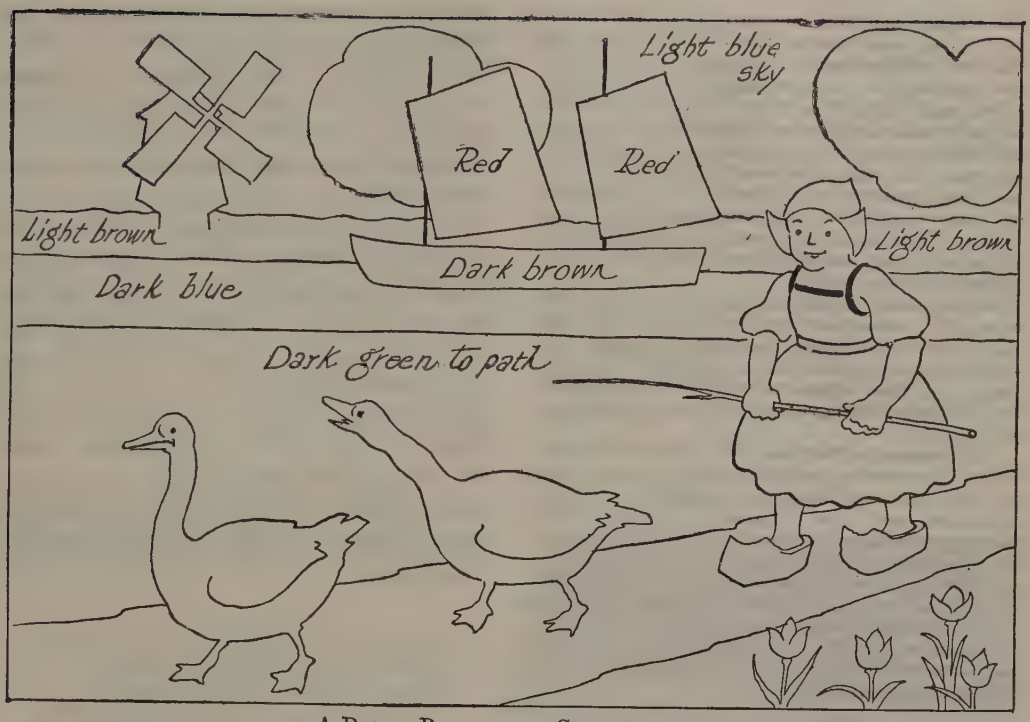
The wind suggests the making of kites—real kites and pictures of kites. Pin wheels are good for this time of year.

Out of the pussy willows that are brought in, pussies can be made sitting on a fence, the head with its ears and the tail are supplied with a black crayola. The soft fur of the pussy willows give them a realistic appearance.

APRIL.

"The rain is raining all around,
It falls on field and tree
It rains on the umbrellas here
And on the ships at sea."

R. L. Stevenson.



A Dutch Picture for Construction.

TOPICS.

Easter—The Farmer's Spring Work—The Barnyard—The Change in Clothing.

Easter—Last month the children's attention was drawn to the waking trees and now some of the early flowers, such as the crocus, are waking up and more will follow. There is also something in the school room that has been sleeping the whole winter through in the nice little house that it spun. It is the caterpillar and when it wakes up it will come out of the little house as a beautiful butterfly. It will stay in one position for quite some time as it has never been out in the world before, its wings are weak and it can not fly. It will later move them slowly up and down and as they grow stronger, it will finally fly.

The grass is now beginning to grow and the trees and bushes are budding out. Baby chicks are hatching and in the midst of growing things, we are not unmindful of who it is that makes things grow. The children will recall the wee babe that they talked of at Christmas time. In brief, tell of how He grew to be a man and became a carpenter. He told the people about the Heavenly Father and after a while He went to live with the Heavenly Father. And the day that He arose is called Easter. The real significance of the day can not be understood by the children of this age and they should be led to think of this season as a season of life rather than a season of death.

After Easter the children will want to tell all about the day and what they did. There are often vivid tales of finding colored Easter eggs and about Easter baskets that they received and where they were hidden.

The Farmer's Spring Work—It is at this time of the year that the farmer gets the ground ready for the seeds. He plows the ground first and then goes over it with a harrow to smooth the clods of earth that the plow has turned up. The seed is planted mainly by machinery in the large fields but in the garden by hand. A talk can be had as to how the different seeds are planted and what the plant is like when it matures, showing again that in some plants, the eatable part grows above the ground and in some it grows below. An excursion to see the planter is the best introduction to this paragraph and the child will be better able to imitate the activities in his small way. If it is not easy to go to see a farmer, a gardner can be observed.

The Barnyard—Along with the talk about the farmer preparing the ground for the spring planting, the subject of the animals that the farmer uses comes up. Where have the animals of the farmer been kept through the long winter when snow was on the ground and the days were very cold? Yes, in the barn where every morning and night the farmer went out to feed them the hay, oats, corn and wheat that he stored in the barn last fall. But now if one were to go out to the farm he would see the different animals out in the barnyard. They are beginning to shed their heavy clothing and to put on lighter suits of fur. This is noticed particularly in the cows and the horses. Have the children name what other animals would be found in the barnyard. Call attention to the chickens, especially to the hen and chicks and then tell how

the mother hen sits on the eggs as the mother bird does, and keeps them warm until the chickens are hatched. As soon as the chickens are hatched the farmer takes the hen and her chicks and puts them in a coop. It is always an interesting sight to see Biddy in the coop and her babies running in and out, gathering the bits of grain that the farmer has scattered about and the constant "Cluck, cluck" of the hen makes us know that she is teaching her babies what to do. Then as dusk comes on, she calls them all in and they snuggle down under her warm feathers for the night.

Notice that the ducks, geese, chickens, turkeys, etc, have feathery coats and two legs. They are called fowls and are a kind of bird. They cannot fly like birds, as their legs are longer and their wings too heavy for long flights. The animals that have hairy or wooly coats have four legs.

The Change in Clothing—We, like the animals, have been wearing heavier clothing to keep out the cold and now we begin to think of making a change, too. Trace the source of the winter clothing and have pictures of the farmer shearing his sheep. Now, the childen see that the material of the clothes that they put on for spring and summer is different and the source of cotton should be the next subject. The children saw the work of the caterpillar and from this, can be shown how silk is obtained from the cocoon of the silkworm.

MANUAL ACTIVITIES.

For Easter the children will be kept busy making Easter baskets, coloring Easter eggs, making rabbits and chickens, some coming out of the shell, and various other things indicative of Easter. This work will be free hand and also by the use of patterns.

Umbrellas can be made by cutting a good sized circle of black and folding in half and over from side to side and pasting on a mount and adding a handle and point.

Birds should be made. Wings can be pasted to each side and then when the bird is suspended by a fine black thread, he looks like he was flying.

Plasticine makes fine bird's nests as well as Easter baskets.

Out of sticks can be built bird houses.

The children should arrange a bath for the birds in the school yard so that they can observe the habits of the birds more closely. Bits of string and yarn should be hung where the birds can get it for the construction of their nests. An old nest of two should be brought into the school and examined to see how it is made and what materials are used.

It is interesting to keep a calendar for the month of April, cutting and pasting little umbrellas on the rainy days and round yellow suns on the bright, pleasant days.

The landscape pictures at this period should show a great improvement. The sky, grass, or water should extend evenly across the paper and be done with a much lighter stroke than earlier in the year.

MAY.

"Oh, sun shine bright in the heavens;
Birds, carol your sweetest lay;
Bloom, beautiful star-eyed daisies,
The year has brought us the May."

Susie M. Best.

TOPICS.

MAY DAY—MOTHER'S DAY—THE CIRCUS.

May Day—For May Day a little program of verses and songs should be prepared. The dance around the Maypole is one of the especial features. The children are too little to make this complicated and it is effective if two circles are formed and, moving in opposite directions, they wind around the pole rather than weave. A lively skip music, changing to marching time, gives variety. The maypole gives great pleasure to the children and therefore should not be confined to May Day alone but used all through the month.

Mother's Day—Though this day comes on a Sunday, there should be observance of it the following Monday. If real flowers are not available for each child to wear, the table period can be devoted to making them. Have the children know why this day is observed and many conversations will follow about the many thing that "Mother" does for them.

The Circus—This and June are the months that the circus comes to town. All the interest is centered on that, both for a period before its arrival (in anticipation) and after its departure. They will tell about the different animals that they saw in the parade. The animals should be put in classes—the wild ones and the tamed ones. Have the children name the ones that are kept in the cages and then the ones that are used by the men for carrying purposes. The elephants are always the most favored and the children will delight in telling what they did in both the parade and in the circus. Have them

imitate the bear and the elephant. A little talk can be had as to where these various animals come from and ask the children where they think they would rather be, at home or in the circus.

The clowns will be discussed, too.

The Bees—The bees are busy now with their summer's work. The Queen Bee gets her workers together and allots to each his particular task which is performed with great dispatch. Children like honey and are therefore interested to know a little as to how it is made. Miss Poulsson has good suggestions for this talk. After a little excursion out into the open and observing the busy bees, the children will return more eager to do their work well. The bees teach industry and when the children realize that it is from them that they get the honey, they take even more interest in taking care of the flowers for it is from them that the bee gets the nectar.

STORIES.

The different bird stories in the Boston Collection of Kindergarten stories.

A Narrow Escape—in "In the Child's World."

The Little Pink Rose—in "Stories to Tell Children," by Bryant.

The Honest Woodman.

Danny Meadow Mouse—by Thornton Burgess.

GAMES.

Follow the Leader.
Street Car Ride.
Wheelbarrow Race.
Fly Away.

SONGS.

A Toad Came in from out of Town.
Child's Garden.
The Dandelion.
The Tulip.
The Seeds.
Dance of the Fairies.
My Old Dan.
The Zoo.

RHYTHMS.

The Merry-Go-Round.
The May Pole Dance.

MANUAL ACTIVITIES.

For May Day make baskets for May flowers and fasten a ribbon or colored thread so as to hang them on a door knob.

Tulips can be cut out and colored and pasted on a card board pot.

Hyacinths can be made by pasting little stars cut from colored paper along a stalk. Then paste a pot over the lower end. All this is done on a mount about 4 by 6.

A bird in a birdcage makes an attractive window decoration and from the outside they very much resemble a real bird. Make the cage from fancy wall paper by folding the paper and cutting out the bars. This cage should be at least 9 by 12. Then a bird is cut and colored yellow and pasted to the back of the cage as though standing on a perch.

Various flowers can be worked out with the parquetry and with the rings.

Gardens are constructed with the sticks or pegs.

Clay makes very nice flower pots when dried and covered with shellac.

Pictures of children working in the garden can be developed. The tools for use in the garden can be cut free hand, such as the hoe, the shovel, and the rake.

The circus parade will be eagerly made after the children have seen it. A long strip of wall paper, blue in color, and upon which a narrow brown strip has been pasted to represent the street, makes a suitable mount for this picture. The wagons are cut with the bars and an animal pasted back to look as though it were in the cage. The wagons, harness on the horses and the trappings of the elephants should all be colored bright colors. They add to the gayness of the picture. The clowns, animals, and all should be drawn from patterns or else cut out after being tranced for them. This parade will take considerable time because of the quantity of objects to be shown.

OLD FASHIONED HAYRIDE. Picnic crowd.

Milton Bradley's Straight Line Cut-outs of the circus make very good borders.

Blocks and colored tablets make Merry-go-rounds, patterned from the child's imagination.

The farmyard provides a project that children will enjoy working out in the sand table. Here they can make paper animals such as cows and horses for the stable, pigs for the pig pen and dogs for the kennel.

Great plans are laid for the last festivity of the year—the picnic. On this occasion they have a jolly good time out at a spot selected where there are no perils. The children delight in getting away for the day where they can have free play and also all the games that they like best. And of course the lunch is one of the big features of the day.

REFERENCE BOOKS FOR STORIES.

Mother Stories and *More Mother Stories*, by Maud Lindsay, published by Milton Bradley & Co., Springfield, Mass.

In the Child's World, by Emilie Poulsson, published by Lathrop Pub. Co.

Boston Collection of Kindergarten Stories.

The Story Hour, by Kate Douglas Wiggin and

Nora A. Smith, published by Houghton, Mifflin & Co., Boston, Mass.

Child Life in Many Lands—The New Century Reader, published by Rand McNally & Co., Chicago, Ill.

How to Tell Stories to Children and *Stories to Tell to Children*, by Sara C. Cone Bryant, published by Houghton Mifflin & Co., Boston, Mass.

For the Children's Hour, by Carolyn S. Bailey & Clara M. Lewis, published by Milton Bradley & Co., Springfield, Mass.

Kindergarten Stories, by Miss Wiltse.

The Thornton Burgess Books.

The Johnny Gruelle Books, published by P. V. Volland Co., New York.

Aesop's Fables, published by Macmillan & Co., London.

A Kindergarten Story Book, by Jane L. Hoxie, published by Milton Bradley & Co., Springfield, Mass.

The Twin Books, by Lucy Fitch Perkins—these books deal with children of various countries, such as the Eskimos and the Dutch.

REFERENCE BOOKS FOR SONGS

Songs and Shadow Pictures for The Child World, Jessie L. Gaynor, published by The John Church Co., Chicago.

The Song Primer, published by A. S. Barnes & Co., Chicago, Ill.

Child Land in Song and Rhythm, Jones Barbour, published by Arthur P. Schmidt, New York.

Primary Melodies—Rote Songs, published by Ginn & Co., Chicago, Ill.

First Year Music, by Hollis Dann, published by the American Book Co.

Mother Goose Songs and *More Mother Goose Songs*, by Ethel Crowninshield, published by Milton Bradley & Co., Springfield, Mass.

Robert Louis Stevenson Songs, by Ethel Crowninshield, published by Milton Bradley Co.

Small Songs for Small Singers, by Neidlinger, published by G. Schirmer, New York.

Songs of the Child World, Nos. I and II, by Riley and Gaynor, published by The John Church Co., Chicago, Ill.

Finger Plays, by Emilie Poulsson, published by the Lathrop Publishing Co.

Ring Songs and Games, The "Wheelock Girls' Song Book," by Flora H. Clifford, published by Milton Bradley & Co., Springfield, Mass.

Songs of Happiness, by Carolyn S. Bailey and Mary B. Ehrmann, published by Milton Bradley & Co., Springfield, Mass.

REFERENCE BOOKS FOR RHYTHMS.

Rhythms of Childhood, by Caroline Crawford and Elizabeth Fogg, published by A. S. Barnes & Co., Chicago, Ill.

Dramatic Games and Dances for Little Children, by Caroline Crawford.

Music for the Child World, by Mari Hofer, published by Clayton F. Summy Co., Chicago, Ill.

Folk Dance Book, by Mari Hofer. I & II. Published by A. Flanagan & Co., Chicago, Ill.

Children's Singing Games, by Mari Hofer, published by A. Flanagan & Co., Chicago, Ill.

REFERENCE BOOKS FOR POEMS AND RHYMES.

A Child's Garden of Verse, by Robert Louis Stevenson.

Eugene Field Reader, published by Charles Scribner's Sons.

Memory Gems for Children, by Jessie Carr Tyndall, published by the Milton Bradley & Co., Springfield, Mass.

Christina G. Rossetti's Poems.

Gordon Readers, published by D. C. Heath & Co.

Free and Treadwell Reader, published by Row, Peterson & Co.

The Howe Readers, published by Charles Scribner's Sons.

Graded Literature Readers, published by Charles E. Merrill Co.

8. THE RESULTS OF A YEAR'S WORK.

By the end of the year through the singing of songs the children should have better control of their voices. Monotone drills and the reproducing of tones from the piano, should cultivate a better tone and help to get the voice into the head rather than in the throat.

By the discussion of the various subjects, much valuable information has been obtained and much of it will leave a lasting impression which will prove a benefit in the years to come. The mind of the average Kindergartner is very receptive and so care should be exercised that authentic facts are given them. Through the discussion of the economic topics, the children are led to feel a more kindly interest in the home and those who make the home possible, in animals, birds, bees, etc., and to feel that they must aid them rather than hinder or destroy.

Observing the rights of others should be one lesson learned. Habits of courtesy should become almost second nature.

Through the stories, a love for good literature should be attained. Concentration is created. By the dramatization of the stories, a better vocabulary is given to the child and a freedom to express oneself in good grammatical sentences.

The manual activities aid in habits of neatness; a sense of the artistic is fostered; a better color and form idea is formed; the imagination is developed and it helps the child to reproduce what he sees and to create as well.

The games are the greatest factor in instilling the thought of fairness. Initiative in taking the lead is developed. In group games the child must realize that he is part of a whole and must aim to do his best to make the game of interest to all.

Rhythms have developed better control of the muscles and have given more poise. In some cases little physical defects are corrected. A

sense of grace should have been created. Ability to keep time has been attained. The little calisthenics such as imitation of the peddling of a bicycle, the reaching for imaginary grapes, the jumping up from a stooping position as a Jack-in-the-box, deep breathing exercises, etc., strengthen the muscles and are an aid toward better health.

HOW TO DO IT.

Do you want to be happy and gay, little man,
  Do you want to be happy and gay?
Then do a kind deed every day, little man,
  Then do a kind deed every day.

Do you want to be merry and glad, little maid,
  Do you want to be merry and glad?
Then speak a bright word to the sad, little maid,
  Then speak a bright word to the sad.

Do you want to be healthy and wise, little folk,
  Do you want to be healthy and wise?
Then early to bed and to rise, little folk,
  Yes, early to bed and to rise.

From Graded Literature Readers, Book II.
Copyright, 1899, by Maynard, Merrill & Co.

DREAMING.

A little boy lay dreaming,
Upon his mother's lap,
That the pins fell out of all the stars
And a star fell into his cap.

So when his dream was over,
What did that little boy do?
Why, he went and looked into his cap
And found it was not true.

Nursery Rhyme.

BOATS SAIL ON THE RIVERS.

Boats sail on the rivers,
  And ships sail on the seas;
But clouds that sail across the sky
  Are prettier far than these.

There are bridges on the rivers,
  As pretty as you please;
But the bow that bridges heaven,
  And overtops the trees,
And builds a road from earth to sky,
  Is prettier far than these.

Christina Rossetti.

THE LOST DOLL.

I once had a sweet little doll, dears,
  The prettiest doll in the world;
Her cheeks were so red and so white, dears,
  And her hair was so charmingly curled.
But I lost my dear little doll, dears,
  As I played on the heath one day;
And I cried for her more than a week, dears,
  But I never could find where she lay.

I found my poor little doll, dears,
  As I played on the heath one day;
Folks say she is terribly changed, dears,
  For her paint is all washed away.
And her arm trodden off by the cows, dears,
  And her hair not the least bit curled;
Yet for old sake's sake, she is still, dears,
  The prettiest doll in the world.

Charles Kingsley.

THE NEW MOON.

Dear mother, how pretty
The moon looks tonight!
  She was never so pretty before;
Her two little horns
Are so sharp and so bright,
  I hope she'll not grow any more.

If I were up there,
With you and my friends,
  I'd rock in it nicely you'd see;
I'd sit in the middle
And hold by both ends;
  Oh, what a bright cradle 'twould be!

And there we would stay
In the beautiful skies,
  And through the bright clouds we would roam;
We would see the sun set,
And see the sun rise,
  And on the next rainbow come home.

Eliza Lee Follen.

THE ROBINS.

One day the sun was warm and bright,
  No cloud was in the sky,
Cock robin said, "My little dears,
  It's time for you to fly."
And every little robin said,
  "I'll try, I'll try, I'll try."

I know a child, and who she is
  I'll tell you by and by;
When mother says, "Do this, or that,"
  She says, "What for?" and "Why?"
She'd be a better child by far
  If she would say, "I'll try."

From the Graded Literature Readers, Book II,
copyright 1899, by Maynard, Merrill & Co.

THE THREE KITTENS.

Three little kittens
Lost their mittens,
And they began to cry,
"Oh, mother dear,
We very much fear
That we have lost our mittens."

"Lost your mittens!
You naughty kittens!
Then you shall have no pie."
"Me-ow, me-ow, me-ow!"
"No, you shall have no pie."

Three little kittens
Found their mittens,
And they began to cry,
"Oh, mother dear,
See here, see here!
See, we have found our mittens."

"Found your mittens!
You dear, dear kittens!
Then you shall have some pie."
"Purr, purr, purr!
Oh, we shall have some pie.
"Purr, purr, purr!"

WHO STOLE THE BIRD'S NEST?

"To-whit! To-whit! To-whee!
Will you listen to me?
Who stole four eggs I laid,
And the nice nest I made?"

"Not I," said the cow, "Moo-oo!
Such a thing I'd never do;
I gave you a wisp of hay,
But didn't take your nest away.
Not I," said the cow, "Moo-oo!
Such a thing I'd never do."

Coo, coo! Coo, coo! Coo, coo!
Let me speak a word, too.
Who stole that pretty nest
From little yellow breast?"

"Not I," said the sheep, "oh, no!
I wouldn't treat a poor bird so;
I gave the wool the nest to line,
But the nest was none of mine.
Baa, baa!" said the sheep, "Oh, no!
I wouldn't treat a poor bird so."

"Caw, caw!" cried the crow,
"I should like to know
What thief took away
A bird's nest to-day?"

"Cluck, cluck!" said the hen,
"Don't ask me again;
Why I haven't a chick
That would do such a trick.
We each gave her a feather,
And she wove them together.
Cluck, cluck!" said the hen,
"Don't ask me again!"

"I would not rob a bird,"
Said Little Mary Green;
"I think I never heard
Of anything so mean."
"'Tis very cruel, too,"
Said little Alice Neal;
"I wonder if he knew
How sad the bird would feel?"

A little boy hung down his head,
And went and hid behind the bed;
For he stole that pretty nest
From poor little yellow breast;
And he felt so full of shame
He didn't like to tell his name.

Lydia Maria Child.

EARLY TO BED.

Cock crows in the morn
To tell us to rise,
And he who lies late
Will never be wise.

For early to bed,
And early to rise,
Makes a man healthy,
And wealthy, and wise.

Nursery Rhyme.

BIRDS THOUGHTS.

I lived first in a little house,
And lived there very well;
I thought the world was small and round,
And made of pale blue shell.

I lived next in a little nest,
Nor wanted any other;
I thought the world was made of straw,
And brooded by my mother.

One day I fluttered from the nest
To see what I could find.
I said, "The world is made of leaves,
I have been very blind."

At last I flew beyond the tree,
Quite fit for grown-up labors.
I don't know how the world is made,
And neither do my neighbors!

From the Graded Literature Readers, Book II.
Copyright, 1899, by Maynard, Merrill & Co.

TWO LITTLE KITTENS.

Two little kittens, one stormy night,
Began to quarrel, and then to fight.
One had a mouse, the other had none;
And that's the way the fight was begun.

"I will have the mouse," said the bigger cat.
"You will have the mouse! We'll see about that."
"I will have that mouse," said the older one.
"You shall not have the mouse," said the little one.

I told you before 'twas a stormy night
When these two kittens began to fight.
The old woman took her sweeping broom,
And swept the two kittens out of the room.

The ground was covered with frost and snow,
And the two kittens had nowhere to go;
So they laid them down on a mat at the door,
While the old woman finished sweeping the floor.

Then they crept in as quiet as mice,
All wet with snow and cold as ice:
For they thought 'twould be better that stormy night
To lie down and sleep, than to quarrel and fight.

LADY MOON.

Lady Moon, Lady Moon, where are you roving?
"Over the sea."
Lady Moon, Lady Moon, whom are you loving?
"All that love me."

Are you not tired with rolling and never
Resting to sleep?
Why look so pale and sad, as forever
Wishing to weep?

"Ask me not this, little child, if you love me:
You are too bold:
I must obey my dear Father above me,
And do as I am told."

Lady Moon, Lady Moon, where are you roving?
"Over the sea."
Lady Moon, Lady Moon, whom are you loving?
"All that love me."

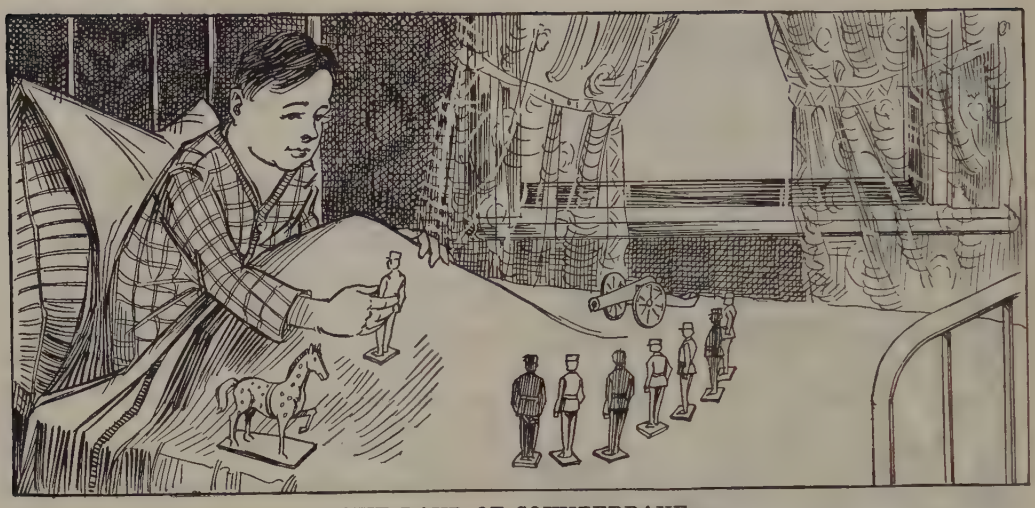
Lord Houghton.

SWEET AND LOW.

Sweet and low, sweet and low,
Wind of the western sea.
Low, low, breathe and blow,
Wind of the western sea!
Over the rolling waters go,
Come from the dying moon and blow,
Blow him again to me;
While my little one, while my pretty one, sleeps.

Sleep and rest, sleep and rest;
Father will come to thee soon.
Rest, rest on mother's breast;
Father will come to thee soon.
Father will come to his babe in the nest;
Silver sails all over the west,
Under the silver moon;
Sleep, my little one, sleep, my pretty one, sleep.

Alfred Tennyson.



THE LAND OF COUNTERPANE.

When I was sick and lay a-bed,
I had two pillows at my head,
And all my toys beside me lay
To keep me happy all the day.

And sometimes for an hour or so
I watched my leaden soldiers go,
With different uniforms and drills,
Among the bedclothes, through the hills;

And sometimes sent my ships in fleets
All up and down among the sheets;
Or brought my trees and houses out,
And planted cities all about.

I was the giant great and still,
That sits upon the pillow-hill,
And sees before him, dale and plain,
The pleasant land of Counter-pane.

Robert Louis Stevenson.

BED IN SUMMER.

In winter I get up at night
And dress by yellow candle-light.
In summer quite the other way,
I have to go to bed by day.

I have to go to bed and see
The birds still hopping on the tree,
Or hear the grown-up people's feet
Still going past me in the street.

And does it not seem hard to you,
When all the sky is clear and blue,
And I should like so much to play,
To have to go to bed by day?

Robert Louis Stevenson.

WINDY NIGHTS.

Whenever the moon and stars are set,
Whenever the wind is high,
All night in the dark and wet,
A man goes riding by.
Late in the night when the fires are out,
Why does he gallop and gallop about?

Whenever the trees are crying aloud,
And ships are tossed at sea,
By, on the highway, low and loud,
By at the gallop goes he.
By at the gallop he goes, and then,
By he comes back at the gallop again.

Robert Louis Stevenson.

MY SHADOW.

I have a little shadow that goes in and out with me,
And what can be the use of him is more than I can see.
He is very, very like me from the heels up to the head;
And I see him jump before me when I jump into bed.

The funniest thing about him is the way he likes to grow—
Not at all like proper children, which is always very slow;
For he sometimes shoots up taller like an india-rubber ball,
And he sometimes gets so little that there's none of him at all.

He hasn't got a notion of how children ought to play,
And can only make a fool of me in every sort of way.
He stays so close beside me, he's a coward you can see;
I'd think it shame to stick to nursie as that shadow sticks to me!
One morning, very early, before the sun was up,
I rose and found the shining dew on every buttercup;
But lazy little shadow, like an arrant sleepy-head,
Had stayed at home behind me and was fast asleep in bed.

Robert Louis Stevenson.

THE WIND.

I saw you toss the kites on high
And blow the birds about the sky;
And all along I heard you pass,
Like ladies' skirts across the grass—
O wind, a-blowing all day long,
O wind, that sings so loud a song!

I saw the different things you did,
But always you yourself you hid.
I felt you push, I heard you call,
I could not see yourself at all—
O wind, a-blowing all day long,
O wind, that sings so loud a song!

O you that are as strong and cold,
O blower, are you young or old?
Are you a beast of field and tree,
Or just another child like me?
O wind, a-blowing all night long,
O wind, that sings so loud a song!

Robert Louis Stevenson.

LITTLE BOY BLUE.

The little toy dog is covered with dust,
But sturdy and stanch he stands;
And the little toy soldier is red with rust,
And his musket molds in his hands.
Time was when the little toy dog was new,
And the soldier was passing fair;
And that was the time when our Little Boy Blue
Kissed them and put them there.

"Now don't you go till I come," he said,
"And don't you make any noise!"
So toddling off to his trundle-bed,
He dreamt of the pretty toys;
And, as he was dreaming, an angel song
Awakened our Little Boy Blue—
Oh! the years are many and the years are long,
But the little toy friends are true!

Ay, faithful to Little Boy Blue they stand,
Each in the same old place—
Awaiting the touch of a little hand,
The smile of a little face;
And they wonder, as waiting the long years through
In the dust of that little chair,
What has become of our Little Boy Blue,
Since he kissed them and put them there.

Eugene Field.

LITTLE DUCKS.

"My dears, whatever are you at?
You ought to be at home;
I told you not to wet your feet,
I told you not to roam.

"Oh, dear! I'm sure you will be drowned,
I never saw such tricks;
Come home at once and go to bed,
You naughty, naughty chicks!"

Now most of them were five days old,
But one whose age was six—
"Please, ma'am," said he, "I think we're ducks;
I don't believe we're chicks."

From the Graded Literature Readers, Book II.
Copyright, 1899, by Maynard, Merrill & Co.

THE BEE AND THE FLOWER.

The bee buzzed up in the heat.
"I am faint for your honey, my sweet."
The flower said, "Take it, my dear,
For now is the spring of the year,
So come, come!"
"Hum!"
And the bee buzzed down from the heat.

The bee buzzed up in the cold,
When the flower was withered and old.
"Have you still any honey, my dear?"
She said, "It's the fall of the year,
But come, come!"
"Hum!"
And the bee buzzed off in the cold.

Alfred Tennyson.

LOOKING FORWARD.

When I am grown to man's estate,
I shall be very proud and great,
And tell the other girls and boys
Not to meddle with my toys.

Robert Louis Stevenson.

WHOLE DUTY OF CHILDREN.

A child should always say what's true,
And speak when spoken to,
And behave mannerly at table,
At least as far as he is able.

Robert Louis Stevenson.

AN EMERALD AS GREEN AS GRASS.

An emerald is as green as grass;
A ruby, as red as blood;
A sapphire shines as blue as heaven;
A flint lies in the mud.

A diamond is a brilliant stone
To catch the world's desire;
An opal holds a fiery spark;
But a flint holds fire.

Christina G. Rossetti

THE SHUT-EYE TRAIN.

Come, my little one, with me!
There are wondrous sights to see
As the evening shadows fall;
In your pretty cap and gown,
Don't detain
The Shut-Eye train—
"Ting-a-ling!" the bell it goeth,
"Toot-toot!" the whistle bloweth,
And we hear the warning call;
"All aboard for Shut-Eye Town!"

Over hill and over plain
Soon will speed the Shut-Eye train!
Through the blue where bloom the stars
And the mother moon looks down
We'll away
To land of Fay—
Oh, the sights that we shall see there!
Come, my little one, with me there—
'Tis a goodly train of cars—
"All aboard for Shut-Eye Town!"

Swifter than a wild bird's flight,
Through the realms of fleecy light
We shall speed and speed away!
Let the night in envy frown—
What care we
How wroth she be!
To the Balow-land above us,
To the Balow-folk who love us,
Let us hasten while we may—
"All aboard for Shut-Eye Town!"

Shut-Eye Town is passing fair—
Golden dreams await us there;
We shall dream those dreams, my dear,
Till the Mother Moon goes down—
See unfold
Delights untold!
And in those mysterious places
We shall see beloved faces
And beloved voices hear
In the grace of Shut-Eye Town!

Heavy are your eyes, my sweet,
Weary are your little feet—
Nestle closer up to me
In your pretty cap and gown;
Don't detain
The Shut-Eye train!
"Ting-ling!" the bell it goeth,
"Toot-toot!" the whistle bloweth—
Oh, the sights that we shall see!
"All aboard for Shut-Eye Town!"

Eugene Field.

THE WIND AND THE LEAVES.

"Come, little leaves," said the wind one day.
"Come o'er the meadows with me and play;
Put on your dresses of red and gold,—
Summer is gone and the days grow cold."

Soon as the leaves heard the wind's loud call,
Down they came fluttering, one and all,
Over the brown fields they danced and flew,
Singing the soft little songs they knew.

Dancing and flying the little leaves went;
Winter had called them and they were content.
Soon fast asleep in their earthy beds,
The snow laid a coverlet over their heads.

George Cooper.

WHAT IS PINK.

What is pink? A rose is pink,
By the fountain's brink.

What is red? A poppy's red,
In its barley bed.

What is blue? The sky is blue,
Where the clouds float through.

What is white? A swan is white,
Sailing in the light.

What is yellow? Pears are yellow,
Rich and ripe and mellow.

What is green? The grass is green,
With small flowers between.

What is violet? Clouds are violet,
In the summer twilight.

What is orange? Why, an orange,
Just an orange!

Christina G. Rossetti.

DAISIES.

Where the pretty bright-eyed daisies are,
With blades of grass between,
Each stands up like a star
Out of a sky of green.

Christina G. Rossetti.

THE SWING.

How do you like to go up in a swing?
Up in the air so blue.
Oh, I do think it's the pleasantest thing
Ever a child can do.

Up in the air and over the wall,
Till you can see so wide,
Rivers and trees and cattle
And all over the countryside.

Robert Louis Stevenson.

THE LITTLE ELF.

I met a little Elf-man once,
Down where the lilies blow.
I asked him why he was so small,
And why he did not grow.

He slightly frowned, and with his eye
He looked me through and through.
"I'm quite as big for me," said he,
"As you are big for you."

John Kendrick Bangs from Gordon Reader, published by D. C. Heath and Co.

MILKING TIME.

When the cows come home the milk is coming;
Honey's made while the bees are humming;
Duck and drake on the rushy lake,
And the deer live safe in the breezy brake;
And the timid, funny, pert little bunny
Winks his nose and sits all sunny.

Christina G. Rossetti.

RIDDLES.

Higher than a house, higher than a tree,
Oh, whatever can it be?
A Star.

Black within and red without;
Four corners round about.
A Chimney.

From Gordon Reader, published by D. C. Heath and Company.

THE COW.

Thank you, pretty cow, that made
Pleasant milk to soak my bread,
Every day and every night,
Warm, and fresh, and sweet, and white.

Do not chew the hemlock rank,
Growing on the weedy bank;
But the yellow cowslips eat,
They will make it very sweet.

Where the purple violet grows,
Where the bubbling water flows,
Where the grass is fresh and fine,
Pretty cow, go there and dine.

Jane Taylor.

THE CITY MOUSE.

The city mouse lives in a house;—
The garden mouse lives in a bower,
He's friendly with the frogs and toads,
And sees the pretty plants in flower.

The city mouse eats bread and cheese;—
The garden mouse eats what he can;
We will not grudge him seeds and stalks,
Poor little timid furry man.

Christina G. Rossetti

From Gordon Reader, published by D. C. Heath and Company.

He prayeth best who loveth best,
All things both great and small;
For the dear God who loveth us,
He made and loveth all.

Samuel Taylor Coleridge.

TWINKLE, TWINKLE LITTLE STAR.

Twinkle, twinkle, little star;
How I wonder what you are!
Up above the world so high,
Like a diamond in the sky.

When the blazing sun has gone,
When he nothing shines upon,
Then you show your little light,
Twinkle, twinkle, all the night.

In the dark blue sky you keep,
And often through my curtains peep;
For you never shut your eye
Till the sun is in the sky.

As your bright and tiny spark
Lights the traveler in the dark,
Though I know not what you are,
Twinkle, twinkle, little star!

Nursery Rhyme.

WHITE SHEEP.

White sheep, white sheep,
On a blue hill.
When the wind stops—
You all stand still.
When the wind blows—
You walk away slow;
White sheep, white sheep,
Where do you go?

Nursery Rhyme.

BLOCK CITY.

ROBERT LOUIS STEVENSON.

What are you able to build with your blocks?
Castles and palaces, temples and docks.
Rain may keep raining and others go roam,
But I can be happy and building at home.

Let the sofa be mountains, the carpet be sea;
There I'll establish a city for me:
A kirk and a mill and a palace besides,
And a harbor as well where my vessels may ride.

Great is the palace with pillar and wall,
A sort of a tower on top of it all,
And steps coming down in an orderly way
To where my toy vessels lie safe in the bay.

This one is sailing and that one is moored:
Hark to the song of the sailors on board.
And see, on the steps of my palace the kings
Coming and going with presents and things.

Now I have done with it, down let it go.
All in a moment the town is laid low.
Block upon block lying scattered and free,
What is there left of my town by the sea?

Yet as I saw it, I see it again,
The kirk and the palace, the ships and the men,
And as long as I live, and where'er I may be,
I'll always remember my town by the sea.

Robert Louis Stevenson.

A GOOD BOY.

I woke before the morning,
I was happy all the day,
I never said an ugly word,
But smiled and kept at play.

And now at last the sun
Is going down behind the wood,
And I am very happy,
For I know that I've been good.

My bed is waiting, cool and fresh,
With linen smooth and fair,
And I must off to slumber land,
And not forget my prayer.

Then sleep will hold me tightly
Till I waken at the dawn,
And hear the robins singing
In the lilacs round the lawn.

Robert Louis Stevenson.

WHERE GO THE BOATS?

Dark brown is the river,
Golden is the sand,
It flows along forever,
With trees on either hand.

Green leaves a-floating,
Castles of the foam,
Boats of mine a-boating—
Where will all come home?

On goes the river
And out past the mill,
Away down the valley,
Away down the hill.

Away down the river,
A hundred miles or more,
Other little children
Shall bring my boats ashore.

Robert Louis Stevenson.

SIMPLE SIMON.

Simple Simon met a pieman
Going to the fair;
Said Simple Simon to the pieman,
"Let me taste your ware."

Said the pieman to Simple Simon,
"Show me first your penny."
Said Simple Simon to the pieman,
"Indeed I have not any."

Simple Simon went a-fishing
To try to catch a whale;
But all the water that he had
Was in his mother's pail.

Simple Simon went to see
If plums grew on a thistle;
He pricked his fingers very much,
Which made poor Simon whistle.

Simple Simon went a hunting,
To try to catch a hare;
He rode a goat about the streets,
But could not find one there.

He carried water in a sieve,
But soon it all ran through;
And now poor Simple Simon
Must say good-bye to you.

American Mother Goose Rhymes.

LITTLE THINGS.

Little drops of water,
Little grains of sand,
Make the mighty ocean,
And the pleasant land.

And the little mountains,
Humble though they be,
Make the mighty ages
Of eternity.

Little deeds of kindness,
Little words of love,
Make our earth an Eden,
Like the heaven above.

Ebenezer Bobham Brewer.

Bow-wow wow!
Whose dog art thou?
Little Tom Tucker's dog,
Bow-wow wow!

AMERICA.

My country, 'tis of thee,
Sweet land of liberty,
Of thee I sing;
Land where my fathers died,
Land of the Pilgrims' pride
From every mountain side,
Let freedom ring!

My native country, thee—
Land of the noble free—
Thy name I love;
I love thy rocks and rills,
Thy woods and templed hills;
My heart with rapture thrills,
Like that above.

Let music swell the breeze,
And ring from all the trees
Sweet freedom's song;
Let mortal tongues awake;
Let all that breathe partake;
Let rocks their silence break,
The sound prolong.

Our fathers' God to Thee,
Author of liberty,
To Thee we sing;
Long may our land be bright
With freedom's holy light;
Protect us by Thy might,
Great God, our King!

Samuel F. Smith.

OUR FLAG.

There are many flags of many lands,
There are flags of every hue;
But there is no flag, however grand,
Like our own Red, White, and Blue.

Then hurrah for the flag, our country's flag,
With its stripes and its bright stars, too
For there is no flag, however grand,
Like our own Red, White, and Blue.

From the Howe Reader, Book II, published by Charles Scribner's Sons.

A MUSIC BOX.

I am a little Music Box,
Wound up and made to go,
And play my little living tune
The best way that I know.

If I am naughty, cross, or rude,
My music will go wrong,
My little works be tangled up,
And spoil the pretty song.

I must be very sweet and good
And happy all the day,
And then the little Music Box
In tune will always play.

Abbie Farwell Brown.

From the Howe Reader, Book II, Published by Charles Scribner's Sons.

THE ROCK-A-BY LADY.

The Rock-a-by Lady from Hush-a-by Street
Comes stealing; comes creeping;
The poppies they hang from her head to her feet,
And each hath a dream that is tiny and fleet—
She bringeth her poppies to you, my sweet,
When she findeth you sleeping!

There is one little dream of a beautiful drum—
"Rub-a-dub!" it goeth;
There is one little dream of a big sugar-plum,
And lo! thick and fast the other dreams come
Of popguns that bang, and tin tops that hum,
And a trumpet that bloweth!

And dollies peep out of those wee little dreams
With laughter and singing;
And boats go a-floating on silvery streams,
And the stars peek-a-boo with their own misty gleams,
And up, up, and up, where the Mother Moon beams,
The fairies go winging!

Would you dream all these dreams that are tiny and fleet?
They'll come to you sleeping;
So shut the two eyes that are weary, my sweet,
For the Rock-a-by Lady from Hush-a-by Street,
With poppies that hang from her head to her feet,
Comes stealing, comes creeping.

Eugene Field.

THE MONTHS

Mary had a little lamb,
His fleece was white as snow;
And every where that Mary went,
That lamb was sure to go.

CRADLE SONG.

Sleep, baby, sleep!
Thy father is watching the sheep!
Thy mother is shaking the dreamland tree,
And down drops a little dream for thee.
Sleep, baby, sleep!

Sleep, baby, sleep!
The great stars are the sheep,
The little stars are the lambs, I guess;
The bright moon is the shepherdess.
Sleep, baby, sleep!

Sleep, baby, sleep!
Thy father is watching the sheep!
Thy mother is shaking the dreamland tree,
And down drops a little dream for thee.
Sleep, baby, sleep!

From the Howe Reader, Book II, published by Charles Scribner's Sons.

BILL OF FARE.

Pies of pumpkin, apple, mince,
Jams and jellies, peaches, quince,
Purple grapes and apples red,
Cakes and nuts and gingerbread—
That's Thanksgiving.

Turkey! Oh, a great big fellow!
Fruits all ripe and rich and mellow,
Everything that's nice to eat,
More than I can now repeat—
That's Thanksgiving.

Lots and lots of jolly fun,
Games to play and races run,
All as happy as can be—
For this happiness, you can see,
Makes Thanksgiving.

We must thank the One who gave
All the good things that we have:
That is why we keep the day
Set aside, our mammas say,
For Thanksgiving.

Eugene Field.

THE MONTHS.

January brings the snow,
Makes our feet and fingers glow.

February brings the rain,
Thaws the frozen lake again.

March brings breezes sharp and chill,
Shakes the dancing daffodil.

April brings the primrose sweet,
Scatters daisies at our feet.

May brings flocks of pretty lambs,
Sporting 'round their fleecy dams.

June brings tulips, lilies, roses,
Fills the children's hands with posies.

Hot July brings thunder-showers,
Apricots and gilly-flowers.

August brings the sheaves of corn;
Then the harvest home is borne.

Warm September brings the fruit;
Sportsmen then begin to shoot.

Brown October brings the pheasant,
Then to gather nuts is pleasant.

Dull November brings the blast—
Hark! the leaves are whirling fast.

Cold December brings the sleet,
Blazing fire and Christmas treat.

Sara Coleridge.

From the Howe Reader, Book II, published by Charles Scribner's Sons.

THE NIGHT BEFORE CHRISTMAS.

'Twas the night before Chrismas,
When all through the house
Not a creature was stirring,
Not even a mouse.

The stockings were hung
By the chimney with care,
In hopes that St. Nicholas
Soon would be there.

The children were nestled
All snug in their beds,
While visions of sugar-plums
Danced through their heads.

Mamma in her 'kerchief,
And I in my cap
Had just settled our brains
For a long winter's nap. . . .

When out on the lawn
There arose such a clatter:
I sprang from my bed
To see what was the matter.

Away to the window
I flew like a flash,
Tore open the shutters
And threw up the sash.

The moon on the breast
Of the new fallen snow
Gave a lustre of mid-day
To objects below:

When what to my wondering eyes
Should appear—
But a miniature sleigh
And eight tiny reindeer!

With a little old driver,
So lively and quick:
I knew in a moment
It must be St. Nick.

More rapid than eagles
His coursers they came,
And he whistled and shouted
And called each by name:

"Now, Dasher, now, Dancer,
Now, Prancer, now, Vixen!
On, Comet! On, Cupid!
On, Donner and Blitzen!

To the top of the porch,
To the top of the wall,
Now, dash away, dash away,
Dash away, all!"

As dry leaves before the wild hurricane fly,
When they meet with an obstacle, mount to the sky:
So up to the house-top the coursers, they flew,
With a sleigh full of toys, and St. Nicholas, too.

And, then in a twinkling,
I heard on the roof
The prancing and pawing
Of each little hoof.

As I drew in my head,
And was turning around,
Down the chimney St. Nicholas
Came with a bound.

He was dressed all in fur
From his head to his foot,
And his clothes were all tarnished
With ashes and soot.

A bundle of toys
He had flung on his back,
And he looked like a peddler
Just opening his pack.

His eyes, how they twinkled!
His dimples, how merry!
His cheeks were like roses,
His nose like a cherry.

His droll little mouth
Was drawn up like a bow,
And the beard on his chin
Was as white as the snow.

The stump of a pipe
He held tight in his teeth,
And the smoke, it encircled
His head like a wreath.

He had a broad face,
And a little round belly
That shook when he laughed
Like a bowl full of jelly.

He was chubby and plump—
A right jolly old elf,
And I laughed when I saw him
In spite of myself.

A wink of his eye,
And a twist of his head
Soon gave me to know
I had nothing to dread.

He spoke not a word
But went straight to his work,
And filled all the stockings
Then turned with a jerk—

And, laying his finger
Aside of his nose,
And giving a nod,
Up the chimney he rose.

He sprang to his sleigh,
To his team gave a whistle,
And away they all flew
Like the down on the thistle.

And I heard him exclaim
Ere he drove out of sight:
"MERRY CHRISTMAS TO ALL,
AND TO ALL A GOOD NIGHT."

Clement Moore.

THE COW.

The friendly cow all red and white,
I love with all my heart.
She gives me cream with all her might,
To eat with apple tart.

She wanders lowing here and there,
And yet she cannot stray,
All in the pleasant open air,
The pleasant light of day;

And blown by all the winds that pass
And wet with all the showers,
She walks among the meadow grass
And eats the meadow flowers.

Robert Louis Stevenson.

MEMORY GEMS.

'Tis a lesson you should heed:
Try, try again;
If at first you don't succeed,
Try, try again.

He prayeth best who loveth best,
All things both great and small,
For the dear God who loveth us,
He made and loveth all.

FINGER PLAY

If a task is once begun,
Never leave it till it's done;
Be the labor great or small,
Do it well or not at all.

Do your best, your very best,
And do it every day;
Little boys and little girls,
That is the wisest way.

Be the matter what it may,
Always speak the truth;
If at work or if at play,
Always speak the truth.

One good trick is better than a hundred poor ones.

Hearts, like doors, will ope with ease
To very, very little keys;
And don't forget that two are these:
"I thank you, sir," and "If you please."

To do to others as I would
That they should do to me,
Will make me honest, kind, and good,
As children ought to be.

Little children, you must seek
Rather to be good than wise;
For the thoughts you do not speak
Shine out in your cheeks and eyes.

Birds of a feather flock together.
Fine feathers do not make fine birds.

All things bright and beautiful,
All creatures great and small
All things wise and wonderful,
The good God made them all.

Politeness is to do or say
The kindest thing in the kindest way.

In books or work or healthful play
Let my first years be passed,
That I may give for every day
Some good account at last.

FINGER PLAY.

Roll your hands, roll your hands,
As slowly, as slowly, as slow can be.
Then fold your arms like me.

Roll your hands, roll your hands,
As swiftly, as swiftly, as swift can be.
Then fold your arms like me!

Clasp your hands, clasp your hands,
As softly, as softly, as soft can be.
Then fold your arms like me!

Clap your hands, clap your hands,
As loudly, as loudly, as loud can be.
Then fold your hands like me.

If all were rain and never sun,
No bow would span the hill;
If all were sun and never rain,
There'd be no rainbow still.

Christina G. Rossetti.

THE DUEL.

The gingham dog and the calico cat
Side by side on the table sat;
'Twas half-past twelve, and (what do you think!)
Nor one nor t'other had slept a wink!
The old Dutch clock and the Chinese plate
Appeared to know as sure as fate
There was going to be a terrible spat.
(I wasn't there; I simply state
What was told to me by the Chinese plate!)

The gingham dog went "Bow-wow-wow!"
And the calico cat replied "Mee-ow!"
The air was littered an hour or so,
With bits of gingham and calico,
While the old Dutch clock in the chimney-place
Up with its hands before its face,
For it always dreaded a family row!
(Now mind: I'm only telling you
What the old Dutch clock declares is true!)

The Chinese plate looked very blue,
And wailed, "Oh, dear! What shall we do!"
But the gingham dog and the calico cat
Wallowed this way and tumbled that,
Employing every tooth and claw
In the awfullest way you ever saw—
And, oh! how the gingham and calico flew!
(Don't fancy I exaggerate—
I got my news from the Chinese plate!)

Next morning, where the two had sat
They found no trace of dog or cat:
And some folks think unto this day
That burglars stole that pair away!
But the truth about the cat and pup
Is this: they ate each other up!
Now what do you really think of that!
(The old Dutch clock it told me so
And that is how I came to know.)

Eugene Field.

SINGING.

Of speckled eggs the birdie sings,
And nests among the trees;
The sailor sings of ropes and things
In ships upon the sea.

The children sing in far Japan,
The children sing in Spain;
The organ with the organ man
Is singing in the rain.

Robert Louis Stevenson.

THE HORSES OF THE SEA

The horses of the sea
Rear a foaming crest,
But the horses of the land
Serve us best.

The horses of the land
Munch corn and clover,
While the foaming sea horses
Toss and turn over.

Christina G. Rossetti.

CHICK-A-DEE, DEE.

Chick-chick-a-dee-dee! saucy note
Out of sound heart and merry throat,
As if it said Good-day, good Sir!
Fine afternoon, old passenger!
Happy to meet you in these places
Where January brings new faces.

Ralph Waldo Emerson.

THE SUN'S TRAVELS.

The sun is not abed when I
At night upon my pillow lie;
Still round the earth his way he takes,
And morning after morning makes.

While here at home, in shining day,
We round the sunny garden play,
Each little Indian sleepy-head
Is being kissed and put to bed.

And when at eve I rise from tea,
Day dawns beyond the Atlantic sea;
And all the children in the west
Are getting up and being dressed.

Robert Louis Stevenson.

How doth the little busy bee
Improve each shining hour,
And gather honey all the day
From every opening flower!

How skillfully she builds her cell!
How neat she spreads the wax!
And labors hard to store it well
With the sweet food she makes.

Isaac Watts.

AT THE SEA-SIDE.

When I was down beside the sea,
A wooden spade they gave to me,
To dig the sandy shore.

My holes were empty like a cup,
In every hole the sea came up,
Till it could come no more.

Robert Louis Stevenson.

A GOOD PLAY.

We built a ship upon the stairs
All made of the back bedroom chairs,
And filled it full of sofa pillows.
To go a-sailing on the billows.

We took a saw and several nails,
And water in the nursery pails;
And Tom said, "Let us also take
An apple and a slice of cake;"—
Which was enough for Tom and me
To go a-sailing on till tea.

We sailed along for days and days,
And had the very best of plays;
And Tom fell out and hurt his knee;
So there was no one left but me.

Robert Louis Stevenson.

MY BED IS A BOAT.

My bed is like a little boat;
Nurse helps me in when I embark;
She girds me in my sailor's coat
And starts me in the dark.

At night, I go on board and say
Good-night to all my friends on shore;
I shut my eyes and sail away
And see and hear no more.

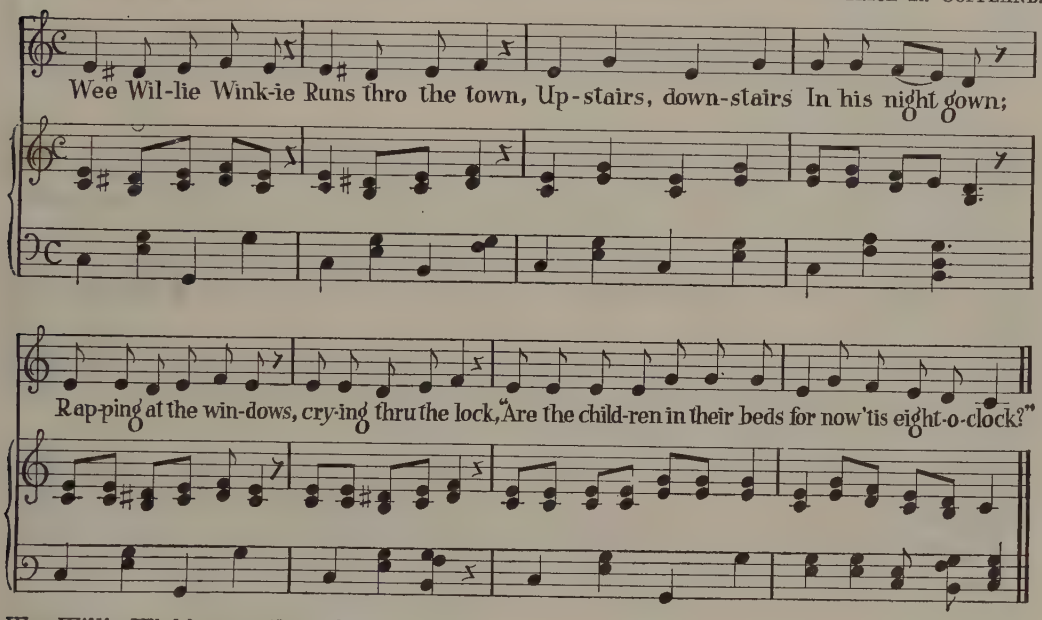
* * * * *

All night across the dark we steer;
But when the day returns at last,
Safe in my room beside the pier,
I find my vessel fast.

Robert Louis Stevenson

WEE WILLIE WINKIE.

BEATRICE R. COFFLAND.



Wee Wil-lie Wink-ie Runs thro the town, Up-stairs, down-stairs In his night gown;
Rap-ping at the win-dows, cry-ing thru the lock, "Are the child-ren in their beds for now 'tis eight-o-clock?"

Wee Willie Winkie runs through the town,
Upstairs and downstairs in his night gown.
Rapping at the window,
Crying through the lock,
"Are the children in their beds, for now it's eight o'clock?"

William Miller.

One is chosen for Wee Willie Winkie and he runs around on tiptoe. At "rapping at the windows" he stops at someone's chair and knocks —pretends to cry through the lock, and points finger to ask if all are in bed.

SIMPLE SIMON.

Simple Simon met a pieman
Going to the fair.
Said Simple Simon to the pieman,
"Let me taste your ware."
The pieman said to Simple Simon,
"Show me first your penny,"
Said Simple Simon to the pieman,
"Indeed I have not any."

Mother Goose.

This should be done in pantomime by two children while the other children sing the words. The two walk around and meet each other, one as Simple Simon and one as the pieman. Stop when the conversation begins. On "Let me taste your ware" Simple Simon motions for some pie and indicates what he wants with it by pretending to eat. The pieman motions for the penny but by the shake of the head and throwing of the arms, Simple Simon shows that he has not any.

LITTLE TOMMY TWIG.

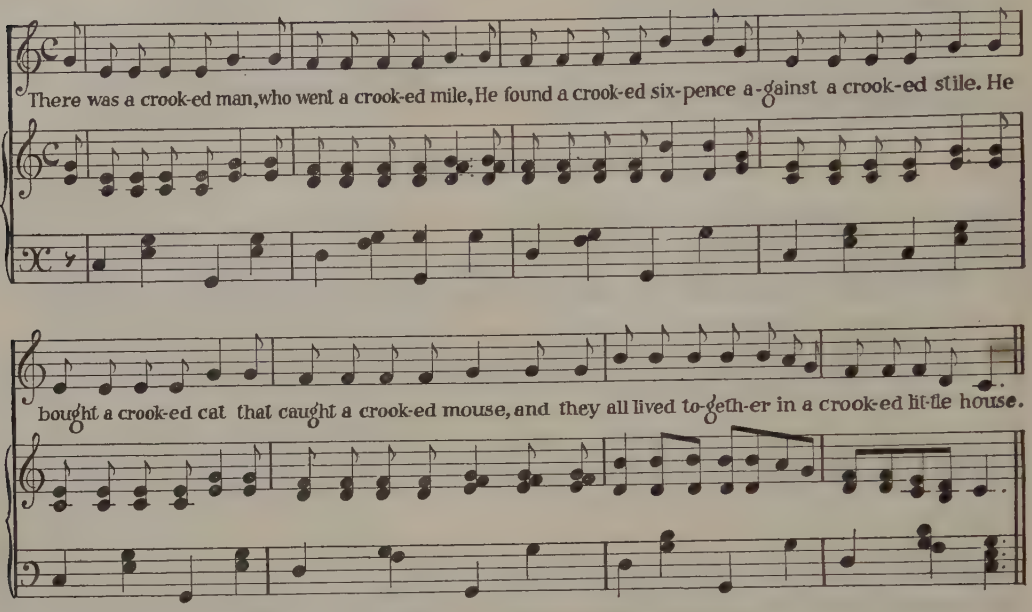
Little Tommy Twig had a fine bow and arrow.
What will he shoot? Why, a poor little sparrow.
Oh, fie! Little Tom with your fine bow and arrow!
How cruel to shoot a poor little sparrow.

Mother Goose.

An imaginary bow and arrow held in position for shooting for the first line. A pointed finger for the second line. A stamp of the foot for the third. A clap of the hands and pointed finger for the fourth.

THE CROOKED MAN.

MOTHER GOOSE. BEATRICE R. COFFLAND.



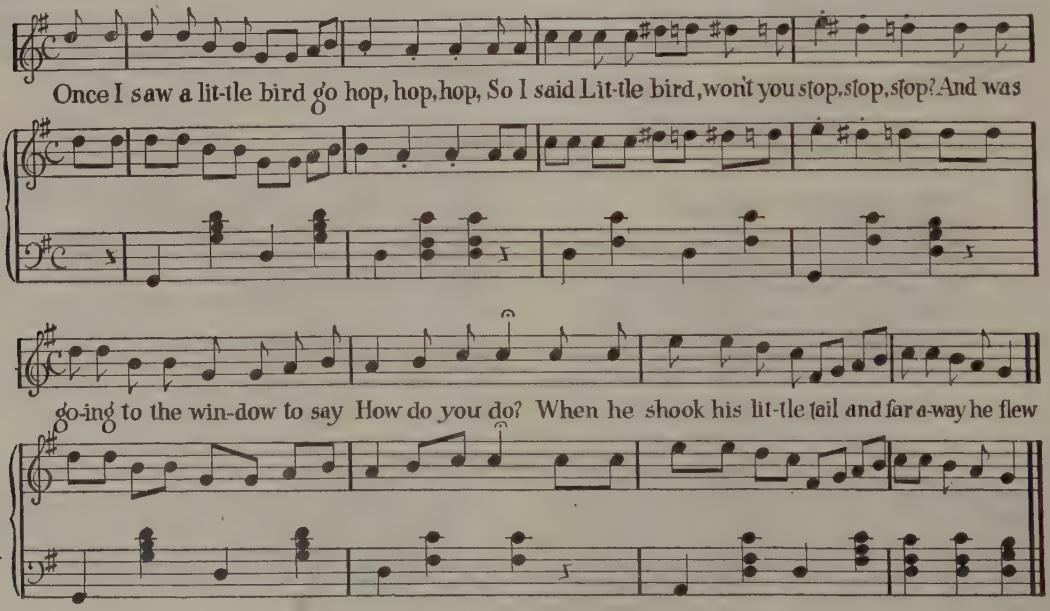
There was a crook-ed man, who went a crook-ed mile, He found a crook-ed six-pence a-gainst a crook-ed stile. He
bought a crook-ed cat that caught a crook-ed mouse, and they all lived to-geth-er in a crook-ed lit-tle house.

There was a crooked man, and he went a crooked mile,
He found a crooked sixpence against a crooked stile;
He bought a crooked cat, which caught a crooked mouse,
And they all lived together in a crooked little house.

Mother Goose.

One starts out as the crooked man who walks crooked by crossing one foot far over the other, etc. He touches one for the crooked sixpence who follows behind in the same manner—then one for the cat and one for the mouse. Much laughter is evoked by the crooked walking.

MOTHER GOOSE. BEATRICE R. COFFLAND.



Once I saw a lit-tle bird go hop, hop, hop, So I said Lit-tle bird, won't you stop, stop, stop? And was
go-ing to the win-dow to say How do you do? When he shook his lit-tle tail and far a-way he flew

THE LITTLE BIRD.

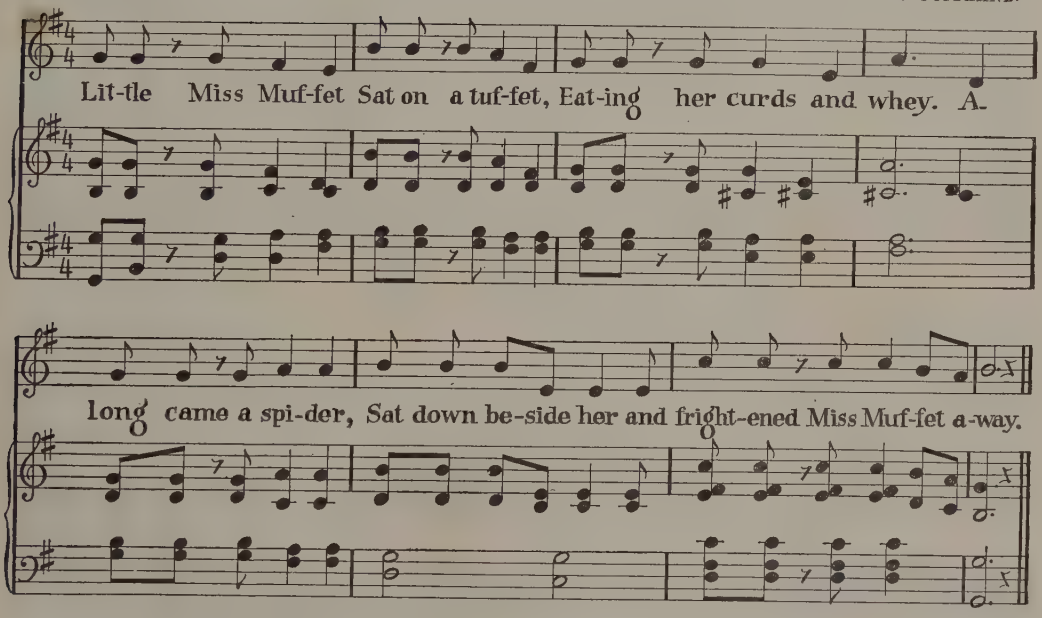
Once I saw a little bird go hop, hop, hop;
So I said, "Little bird, won't you stop, stop, stop?"
And was going to the window to say, "How do you do?"
But he shook his little tail
And far away he flew.

Mother Goose.

Several are chosen to stand in a row. Hand shading the eyes for "once I saw." Three hops for "hop, hop, hop." Hands held out entreatingly for "Little bird won't you stop, stop, stop?" A bow or courtsy for "How do you do." Wave of the hand for "shook his little tail" and flying of the arms for "far away he flew."

LITTLE MISS MUFFET.

MOTHER GOOSE. BEATRICE R. COFFLAND.



Lit-tle Miss Muf-fet Sat on a tuf-fet, Eat-ing her curds and whey. A-
long came a spi-der, Sat down be-side her and fright-ened Miss Muf-fet a-way.

Little Miss Muffet sat on a tuffet,
Eating of curds and whey.
Along came a spider
And sat down beside her
And frightened Miss Muffet away.

Mother Goose.

Miss Muffet sits on a stool with a bowl and spoon pretending to eat. A child crawls toward her as the spider which frightens Miss Muffet and she drops the things and runs away.

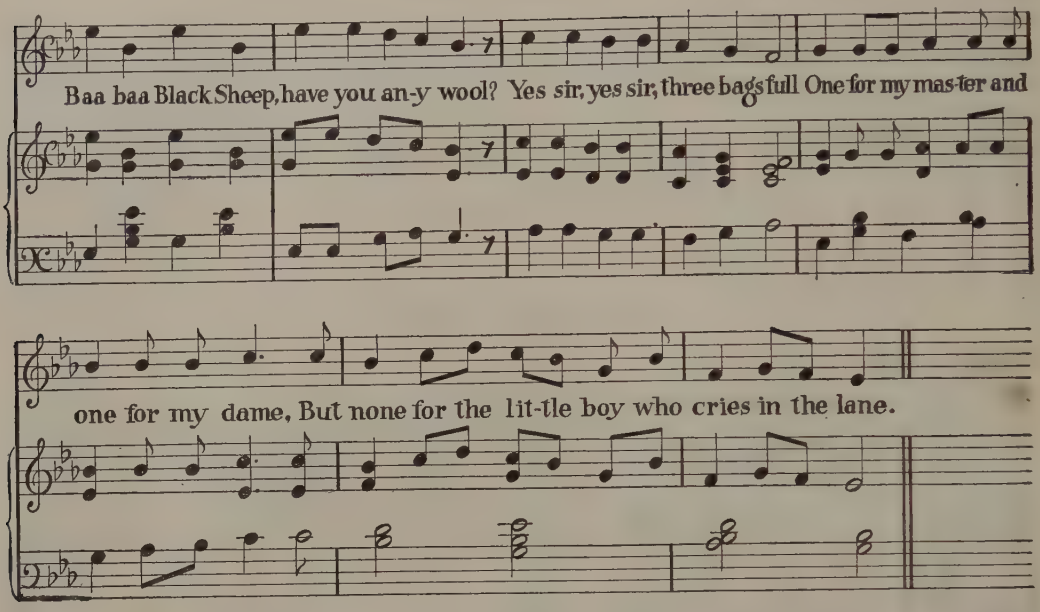
BAA, BAA, BLACK SHEEP.

"Baa, baa, black sheep,
Have you any wool?"
"Yes sir, yes sir.
Three bags full.
One for my master,
One for my dame,
But none for the little boy
Who cries in the lane."

Mother Goose.

One in the center of a ring with arms over his eyes pretending to cry. All the rest skip around him as they say the first four lines. Then they stop and hold up one finger to show one bag for the master, and one to show a bag for the dame. But they stamp their feet and point at the little boy for the last two lines.

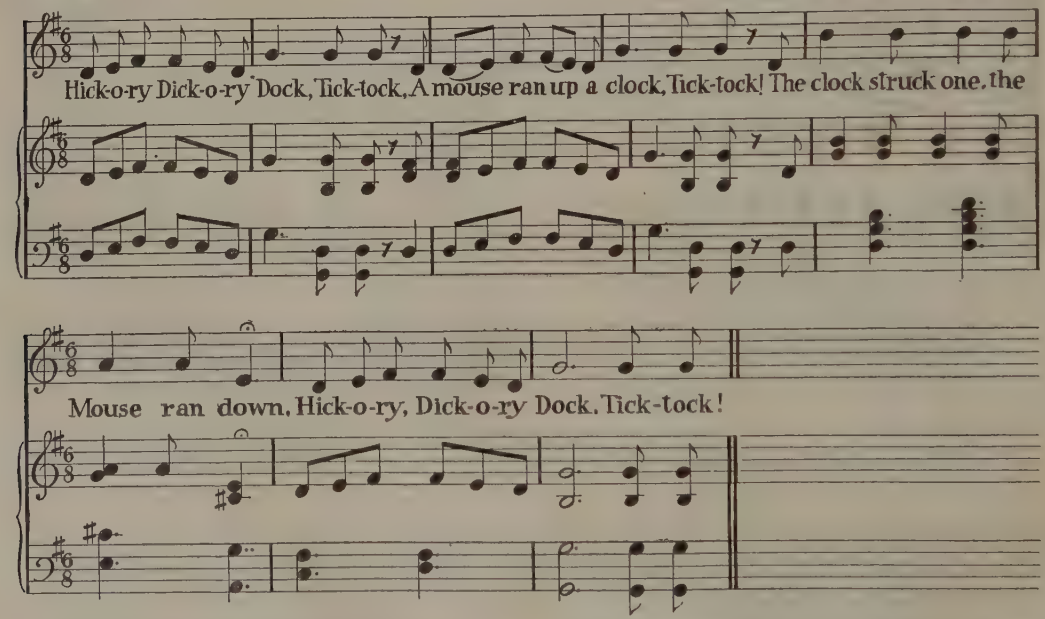
MOTHER GOOSE. BEATRICE R. COFFLAND.



Baa baa Black Sheep, have you an-y wool? Yes sir, yes sir, three bags full One for my mas-ter and
one for my dame, But none for the lit-tle boy who cries in the lane.

HICKORY, DICKORY, DOCK.

MOTHER GOOSE. BEATRICE R. COFFLAND.



Hick-o-ry Dick-o-ry Dock, Tick-tock, A mouse ran up a clock, Tick-tock! The clock struck one, the
Mouse ran down, Hick-o-ry, Dick-o-ry Dock, Tick-tock!

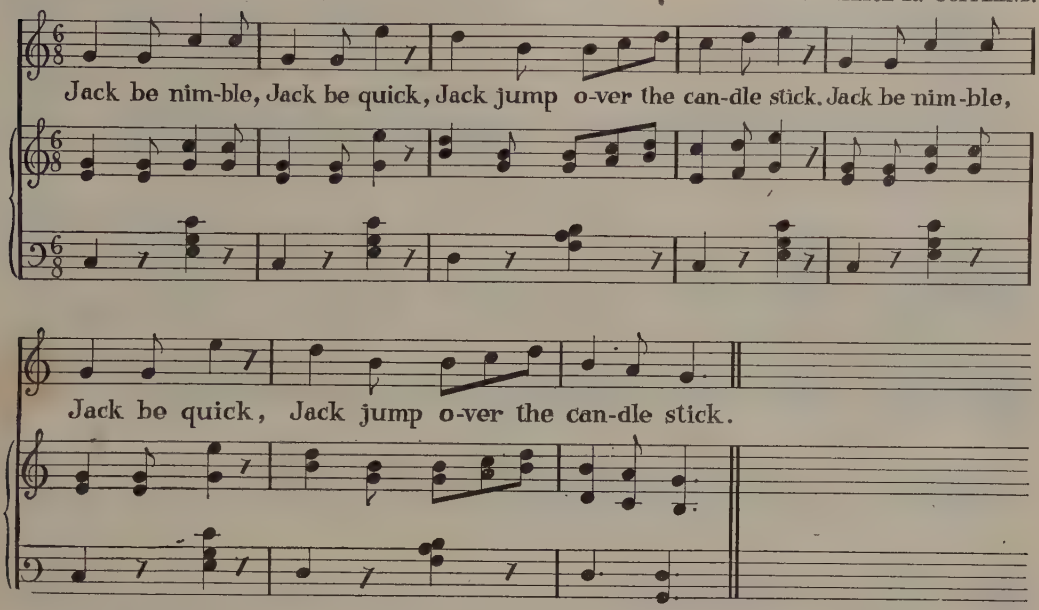
Hickory, dickory, dock; tick, tock.
The mouse ran up the clock, tick, tock
The clock struck one,
The mouse ran down.
Hickory, dickory, dock; tick, tock.

Modified Mother Goose.

Three children each in two lines facing each other. They walk toward one another on the "Hickory, dickory" and then stop and stamp twice on the "Tick, tock." Walk back on the second line. Clap hands on "one." Repeat the motions of the first line for the last line.

JACK, BE NIMBLE.

MOTHER GOOSE. BEATRICE R. COFFLAND.

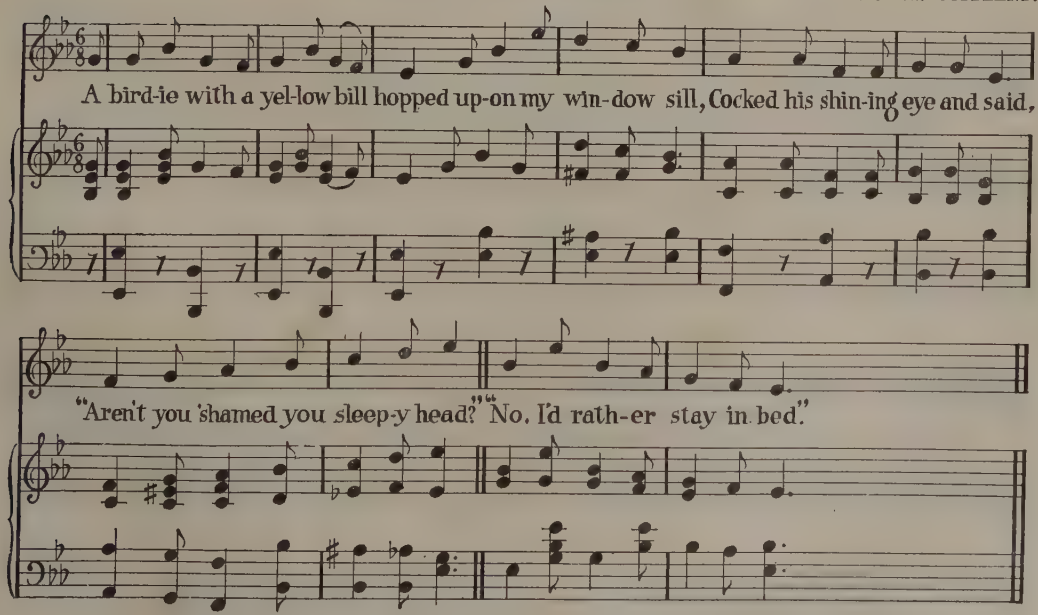


Jack, be nimble,
Jack, be quick,
Jack, jump over the candle stick.
Jack, be nimble,
Jack, be quick,
Jack, jump over the candle stick.

Something to represent a candle is placed in the center of the circle, and each takes turn playing Jack and jumping on the word "jump."

A BIRDIE WITH A YELLOW BILL.

BEATRICE R. COFFLAND.



A bird-ie with a yel-low bill hopped up-on my win-dow sill, Cocked his shin-ing eye and said,
"Aren't you 'shamed you sleep-y head?" "No, I'd rath-er stay in bed."

A birdie with a yellow bill,
Hopped upon my window-sill.
Cocked his shining eye and said,
"Aren't you shamed, you sleepy-head?"

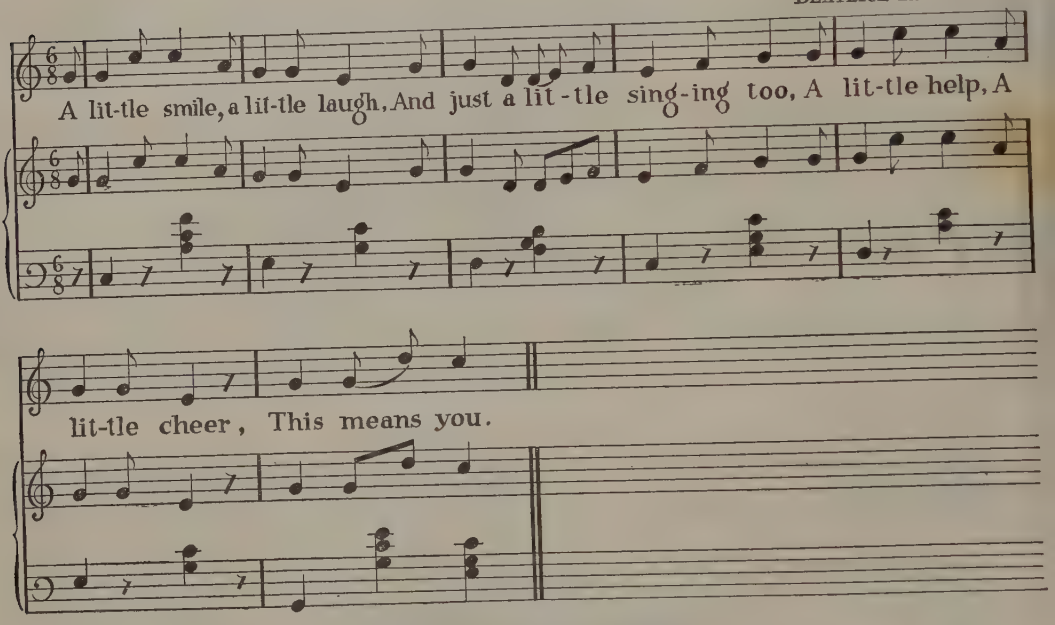
"No, I'd rather stay in bed."

Robert Louis Stevenson.

Several stand to take part in this. For the first line, they put the fingers and thumbs of both hands together to represent the bill—opening and shutting the palms together. A little hop for "hopped" and a hand held out for a window-sill are the motions for the second line. On the third line, cock the head and then point a finger at an imaginary "sleepy-head." A few children chosen for the sleepy-heads reply the last line as they stretch and pretend a yawn.

THIS MEANS YOU.

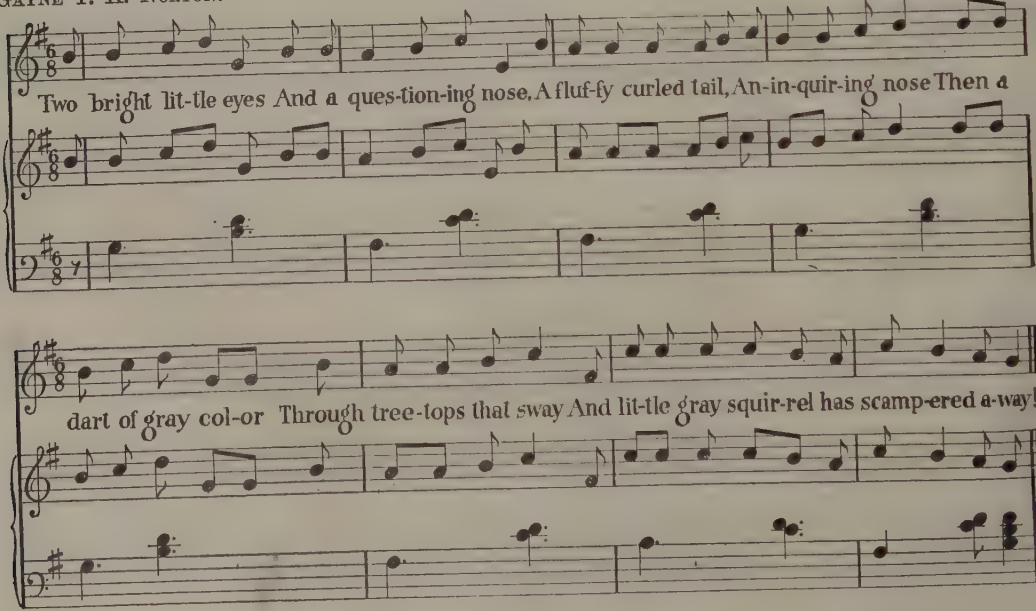
BEATRICE R. COFFLAND.



THE LITTLE GRAY SQUIRREL.

GAYNE T. K. NORTON.

BEATRICE R. COFFLAND.



Two bright lit-tle eyes And a ques-tion-ing nose, A fluf-fy curled tail, An-in-quir-ing nose Then a
dart of gray col-or Through tree-tops that sway And lit-tle gray squir-rel has scamp-ered a-way!

A study of the Human Body, its material, its parts, the way these parts fit together, is called Anatomy.

A study of the use of each part, the work it does, the function it performs, the coming together of all these operations to make up the one complex series of well-timed, closely connected activities that we call the life of an organism, is called Physiology.

A study of the right use, the proper activities, and right care during and after these activities; of the well-being of each and every part and of their individual and collective functions; a study of how to keep well, a study of the health of the body and its life—this is called Hygiene; any of these statements is a sufficient definition.

PLAN OF THE HUMAN BODY.

The plan of our body is that of the mammalian vertebrate. That is the fundamental structure of the body is the backbone (inside-skeleton) or Endoskeleton. This backbone is not, as the name suggests, one bone, but a series of them numbering twenty-four, each called a vertebra. These are piled together in a column so that a central opening in each fits to the preceding and to the following, making a canal through which passes the great nerve cord called the spinal cord. From this the column is also called the spinal column. We have, then, as names for the foundation structure: *backbone, spinal column,* or *vertebral column.* Animals whose bodies have this as a feature are called vertebrates.

The conception includes the idea that the backbone is so placed that the body has a forward, or up-end, that develops a head; a hind, or down, or tail end. In carrying on life activities this results in using the body so that there is a front and a back, a right and a left side.

The back bone is so planned that it constitutes

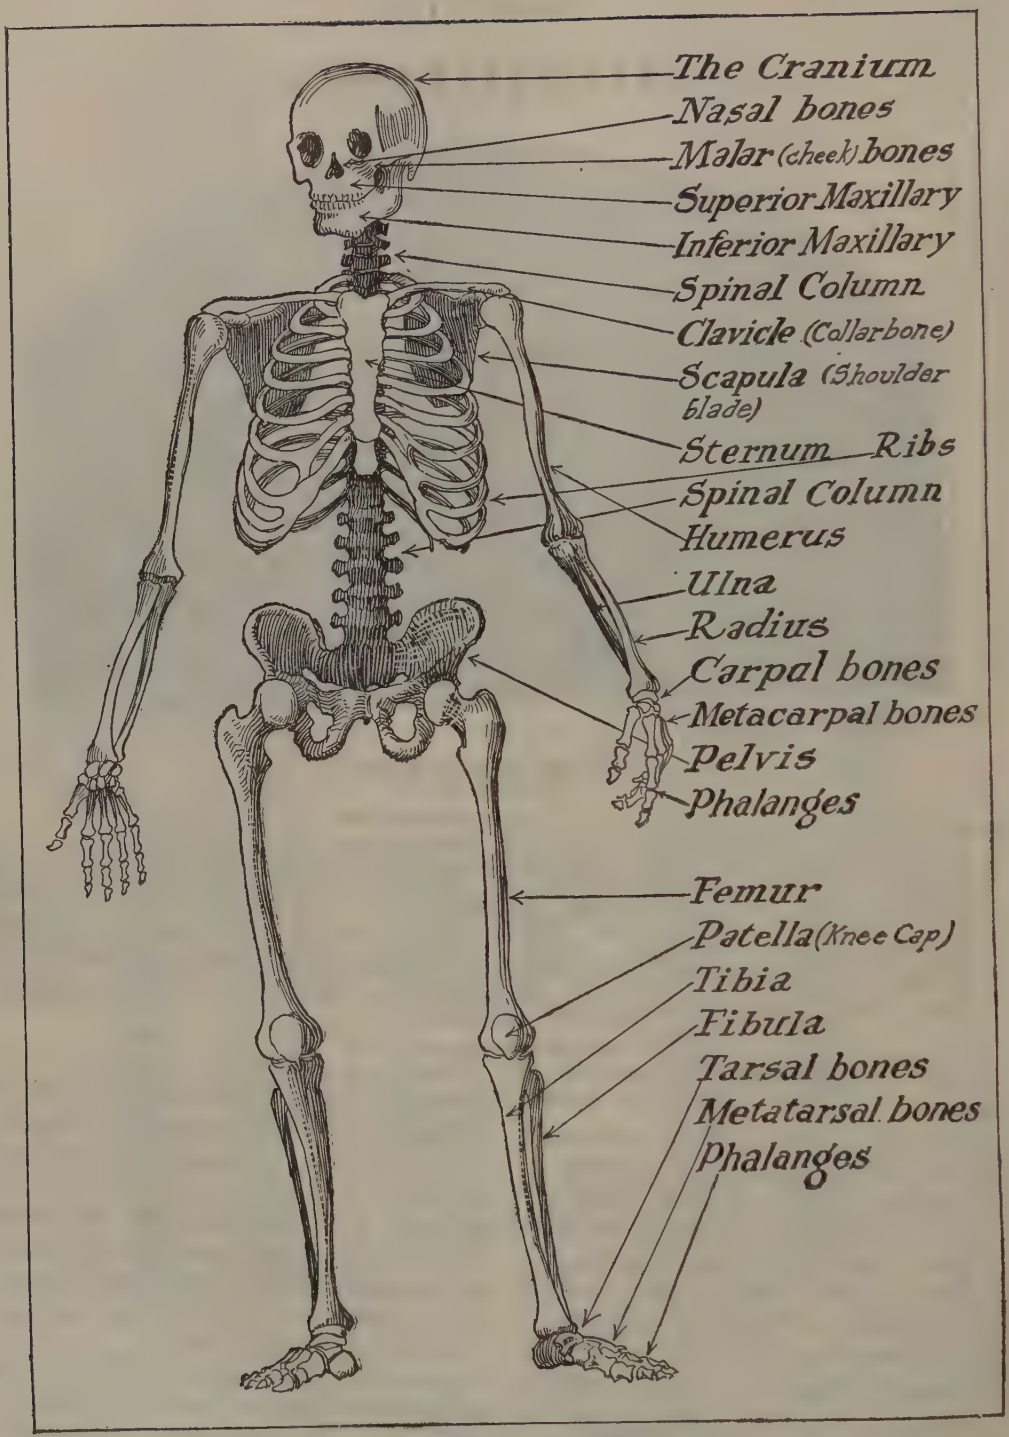

Fig. II The Skeleton.

the basis for two cavities extending the length of the body—one on the backside called the *Dorsal Cavity;* or, since it holds the central nervous system (the brain and the spinal cord), it is also called the *Neural Cavity;* one on the front side is called the *Ventral Cavity* or, since it holds the groups of organs called the Viscera (heart, lungs, stomach, intestines, etc.) it is also called the *visceral cavity.*

This axis also provides for two girdles—one near the front and one at the hind end. From these extend limbs which in some forms are used in water as oars and called *fins;* in others for walking or running, or crawling on land, and are called *legs.* The front pair of limbs, in some forms, are used in such a way that they become wings, or arms and hands. These extensions or limbs may be entirely lost by using ways of movement that make them unnecessary as in the case of snakes. But here we usually find vestiges of girdles just as in the case of tailless vertebrates, where we find structures that point to a tail useful in former generations. These features all belong to the vertebrate and they all grow from a bony foundation, called the skeleton.

The bones of the skeleton are covered by muscles which move them. They are also covered by a network of blood vessels, intermingled with a network of nerves, an enmeshing connective sheet binding all together, all covered by a skin. We call it the *Endoskeleton,* i.e., the *Inner Skeleton.*

There are five well-developed classes of vertebrates. Among them is the *human body* which is built on the *Mammalian plan.* This means that the animal is a vertebrate, with (1) an Endoskeleton as described; (2) a skin that covers and protects, forms and carries an outer-skeleton or exoskeleton of slime and scales, as fish; or of dry scales as snakes; (3) or as illustrated in the case of scales on lizards, alligators and turtles where the scales may become large, strong, bony plates, often with great horns; (4) or of feathers, as in the case of birds; (5) or hair, as in the case of fur-bearing animals, cattle, sheep, cats, dogs and man.

Also the young are shed from the body of the mother not as eggs, but developed so far that they look so like the father and mother, that love, parental care and home in larger and better ways are brought about and so make provision for a soul development that does not show itself in such ways among lower animals. Their young are fed on milk from glands called mammae developed on the mother's body. The name mammal comes from the name of these glands.

I. The Axial Part of the Endoskeleton.
   1. Skull.
   2. Spinal column.
      a. Cervical vertebrae.
      b. Dorsal vertebrae.
      c. Lumbar vertebrae.
   3. Sacrum—5 modified and fused vertebrae.
   4. Coccyx—4 vestigial vertebrae.

II. The Appendicular Part of the Endoskeleton.

III. The Supporting Structures—the Inner Skeleton or Endoskeleton.

The ideas of support, meaning the holding in position of the parts of the structure for sustaining weight or shock; and of protection, cannot well be separated in considering the Endoskeleton, usually called merely "skeleton." And we cannot overlook the part it plays in the function of motion, as will be seen in the discussion of that topic. For convenience we study the structural features of the entire Endoskeleton, as the supporting framework of the body. Glancing at the outline, it will be seen that we will have to consider, first, the axial skeleton, second, the appendicular skeleton.

Axial Skeleton.

In the Human, the framework of the head, i.e. the skull, rests on top of the backbone. This skull consists of eight bones which are drawn and named in figure (III). The joints by which the eight bones are held together to make the cavity for holding the brains, are called *sutures.* These are *immovable joints.* The figure shows the dove-tailing by which they are tightly held together, making a light but strong-walled box, which is completely filled by the brain and has openings only for the passing of nerves (chief of which is the great nerve called the spinal cord), and of blood vessels.

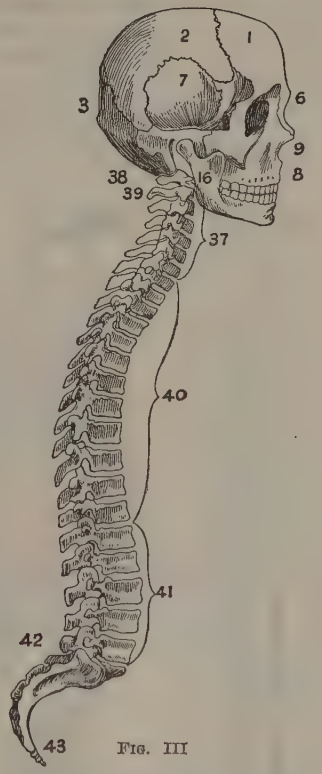

FIG. III

1, frontal bone; *2,* parietal; *3,* occipital; *6,* orbital cavity; *7,* temporal bone; *8,* maxillary; *9,* malar; *16,* mandible; *37,* cervical or neck vertebræ; *40,* dorsal or thoracic vertebræ; *41,* lumbar vertebræ; *42,* sacrum; *43,* coccyx; *38* and *39,* spines of axis and atlas.

Under and in front of the skull, are *fourteen face bones.* The larger and more conspicuous from their positions are shown in figure (II). Three small bones in each ear, i.e. six bones, might also be counted among the bones of the head. They are named from their shape, *Hammer, Anvil* and *Stirrup.* All these belong with the *Appendicular* skeleton.

Coming to the rest of the backbone (Spinal column, or vertebral column) we have to consider the Vertebrae or segments of the backbone. These are twenty-four separate bones, varying in shape according to the needs of their position. The figure shows them grouped as they occur in the body and as listed in the outline. The figure shows a typical vertebra and makes plain how when twenty-four are piled in a column they give, with the skull, the cavity for the Brain and Spinal Cord, as shown in figure (3). The joints are classified as *slightly movable.* This column of Vertebrae rests on the bone called the *Sacrum.* This bone really consists of five large vertebrae grown together. Following these are five much reduced vertebrae, no longer needed, called the *Coccyx,* the remnant indicating a tail once usable in our progenitors. All this constitutes the part of the Endoskeleton called the axial skeleton.

II. The Appendicular Part of the Endoskeleton.

Appended to various parts of this axis (axial skeleton) are bones that taken together make up the Appendicular Skeleton.

Beginning with the head we have already fourteen face bones as named in the outline and referred to in study of the head. Many are shown in figures (2) and (3).

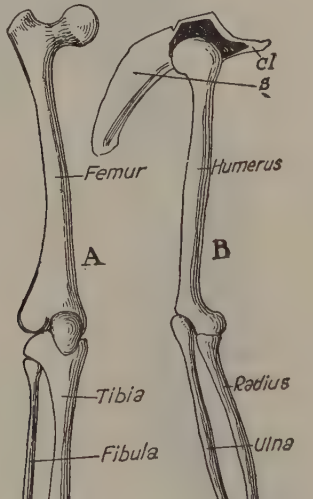

FIG. IV

The *Hyoid bone* on which the tongue rests has no skeleton connection. The twenty-four ribs and the Sternum, or Breast bone, and the part they play in forming the thorax or chest cavity with the axis can be very well understood from the study of figure (V) of the Endoskeleton.

The most conspicuous features of the Appendicular part of the Endoskeleton are the parts making up and suspended from the two girdles. These two can best be studied by using the outline and referring to the cut of Endoskeleton and then handling these parts of your own body.

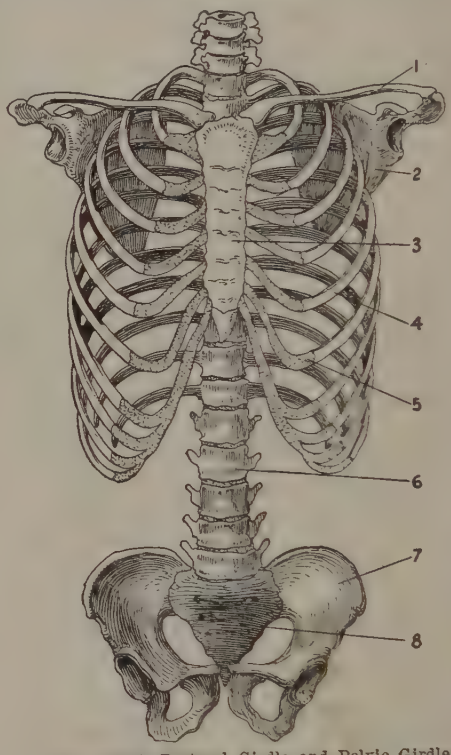

FIG. V Chest, Pectoral Girdle and Pelvic Girdle. *1,* Clavicle; *2,* Scapula; *3,* Sternum; *4,* Ribs; *5,* Costal Cartilage; *6,* Vertebral Column; *7,* Osinnominatum; *8,* Sacrum.

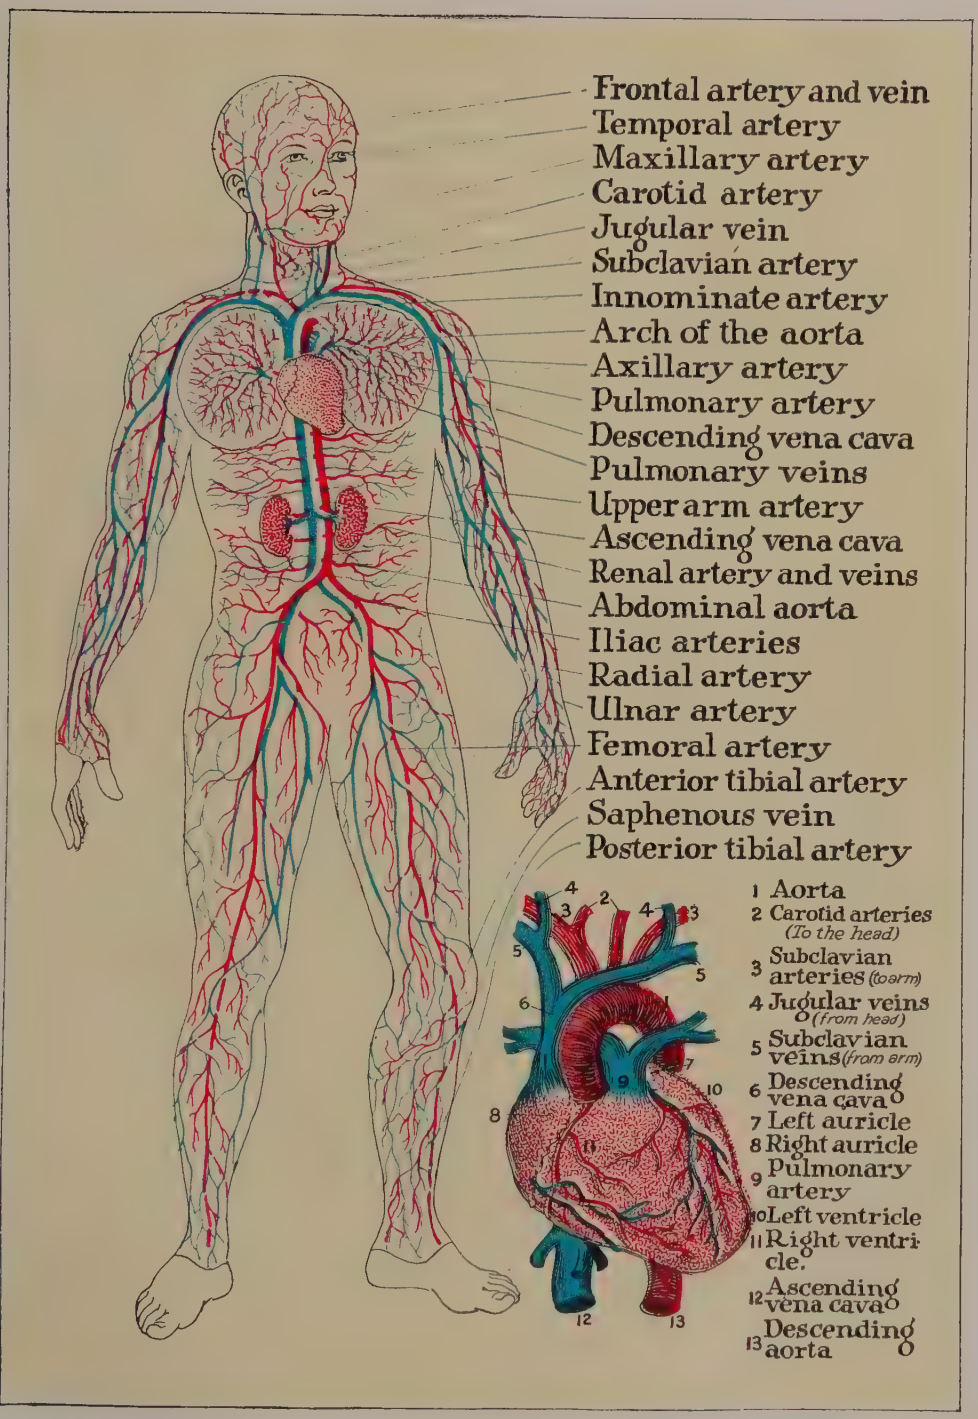
III. The Supporting Structures.

In the study of the *protecting structures,* we have to consider the outer skeleton, or the *exoskeleton.*

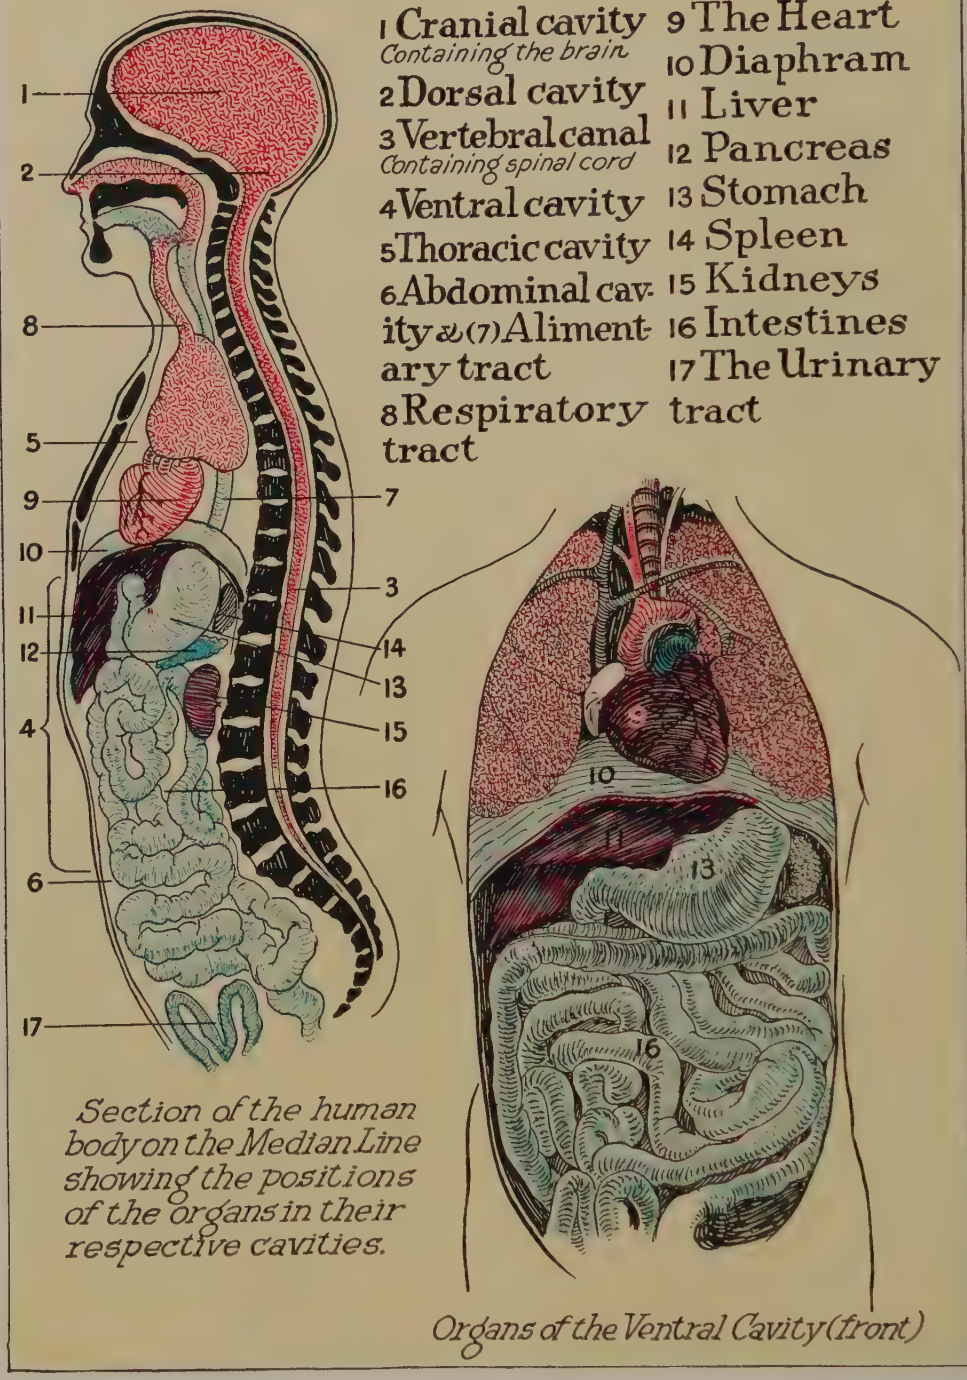
The parts we are concerned with as the outer skeleton is chiefly the layer called the *epidermis* and of this only the *cuticle,* the hair and nails which are outgrowths of the live part of the epidermis. The thickness of the whole sheet not the protective skeletal part only, varies from one-eighth inch to one-hundredth inch in different parts of the body. The area it covers in an adult varies from twelve to twenty square feet.

As an outer skeleton (exoskeleton) it serves like the inner skeleton (endoskeleton), as a support. It does this (1) through layers, forming holdings for nerve end-organs of touch, blood vessels and sweat glands, which together regulate the temperature of the body and perform an important excretory function by eliminatin



Drawn by Selden Irwin

THE CIRCULATORY SYSTEM



Drawn by Selden Irwin

THE ORGANS OF THE HUMAN BODY

poisonous matter in solution that we call sweat; (2) it also serves as a protection as does the inner skeleton.

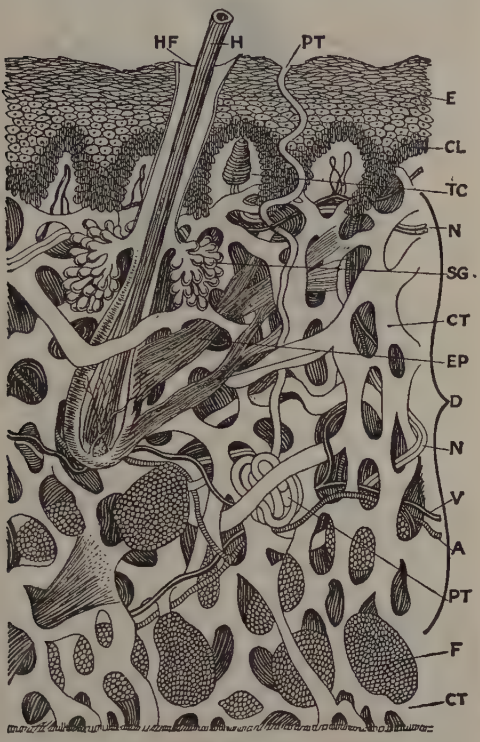


FIG. VI

Longitudinal section of skin (partly diagrammatic), magnified about 100 diameters. Its structure and contents (with the exception of the lymphatics).—E, epidermis; D, dermis; CL, color layer; TC, tactile corpuscle; N, nerve; V, vein; A, artery; CT, connective tissue; F, adipose tissue; HF, hair follicle; PT, perspiratory tube and gland; SG, sebaceous gland; EP, erector pilate muscle; H, a hair.

Among the ways of functioning in this manner are (1) *covering*—for this purpose it is elastic, strong, light, and beautiful. (2) It prevents *evaporation* of the body fluids. (3) It prevents the *entrance of dangerous* and *foreign* matter, as dust and bacteria. (4) It prevents too rapid *access* and *loss* of heat. (5) It prevents or lessens injuries from *friction, bruises,* and *cuts.* (6) It covers the space provided by the inner layer for the very extended *distribution of nerve-ends* and so makes possible the various experiences of sensation, touch, taste, smell, hearing, seeing, and by this means regulates the intensity of the function.

It also gives protection as an *aggressive agent* —having parts developed for positive offense as well as parts that protect by their negative defensive ways. For this we have the nails and the teeth. The teeth are outgrowths of that part of the skin which lines the mouth. This is called *mucous membrane,* and is really an extension of the skin inward to line the inner cavities of the body reached by air. With us the teeth are no longer needed primarily as protective mechanisms but some features of their structure show that they were used for such purposes. The nails are highly modified for uses quite different from those of the claws and talons of offensive, preying animals.

Cavities, Walls and Contents.

The foundations for the great cavities of the body, as can be seen in the figure of the Endoskeleton, are provided by these parts of the axial and appendicular skeleton. The best way to study them is by using the outline and figures together, but further study of these and their contents will be made under other headings already referred to under the study of the plan of the Human Body. Here we study them with the definite aim of getting clear notions of *walls, contents, size,* and *relations.*

The illustration shows the dorsal cavity running the length of the body, consisting of the two parts, (1) the skull or *cranial cavity,* holding the brain; (2) the walls consisting of the bones of the skull, resting upon the backbone. The cavity is continued through the backbone as the spinal canal, holding the spinal cord, which is but an extension of the brain into the backbone.

In front of this and extending parallel with it, is the *ventral* or *visceral cavity,* consisting of irregular cavities, varying much in size and shape, holding organs that, taken together, are called *viscera;* it consists of the subdivisions:

I. *Nose cavity* or nasal chamber;
II. Mouth or oral chamber;
III. Throat or Pharynx;
IV. Thorax or Chest;
V. Abdomen or Belly;
VI. Pelvic cavity.

(1) The *nose cavity* extends into the upper part of the throat called the nose-throat; the *mouth,* leading into the middle part of the throat is called the mouth-throat. These two parts of the throat are called the voice-throat. The three parts, nose-throat, mouth-throat, and voice-throat together make a continuous cavity, somewhat funnel-shaped, though quite irregular, and are called the throat or *pharynx.*

(1) The walls of the nose cavity, which is a double, rather pear-shaped cavity, are fleshy at the front part, the entrance divided by a partition to make the two nostrils—called the *anterior nares;*—but, at the base, the walls of the chamber proper are bony. All the way they are covered with mucous membrane.

The partition, called the *Septum,* is cartilaginous in front, but bony further back. The back openings into the upper or nose-throat we call *posterior nares.*

The front part of the chamber is called the respiratory portion. The lining of the outer portion of this bears hairs which help strain out of the entering air the coarse dust particles. In the bony-walled portion, the mucous membrane lining bears ciliated *epithelium* which with secretion from the gland cells of the mucous membrane helps to remove fine dust and other foreign materials.

The wall surface of the nasal chamber is much increased by curved shelves of bone plates projecting into the cavity from the wall. This increases the air-warming capacity of the nasal chamber by furnishing room for more abundant distribution of blood capillaries and thereby in-

creases the amount of warm blood at the surface; as well as increasing the air-cleansing capacity, by enlarging the surface of ciliated Epithelium.

Besides these two important functions the mucous membrane lining is supplied with a network of nerve fibers and nerve-ends that make up the receptive end of the machinery for the sense of smell. The nerve net work gives the mucous membrane a characteristic appearance and we call it the Schneiderian membrane.

(2) Turning again to the cut just studied for the nasal cavity, we take up next the study of the mouth cavity. With a mirror, see all you can, and with a clean finger-tip feel all you can, of your own mouth. The floor of the nasal chamber makes a part of the roof of the mouth; like the nasal chamber, it opens backward into the throat—the part known as the mouth-throat.

It is a cavity nearly oval-shaped, closed by the lips in front; when closed the floor and roof are usually in contact, and the sides come up to the tooth-arches. The space in front of the teeth is the vestibule, and behind these the mouth cavity proper.

In the cavity, *mouth-digestion*, consisting of *mastication* and *insalivation*, takes place. Here too, the tasting of the food is experienced, and absorption of what is digested and the swallowing process, *deglutition* begins. Get the relations by studying the outlines.

The enclosing walls in front and at the sides are the lips and cheeks, while the floor holds the tongue and its supporting bone, the hyoid. These walls consist of *glandular*, *muscular*, and *connective* tissues. The skin flaring upward and outward forms the neck.

The cavity holds within its space and by its walls the jaws, upper and lower, bearing the teeth, sixteen in each in the second set (preceding this was a first set consisting of ten in each jaw); also the tongue, free in front and supported behind by the hyoid bone; within the mouth walls are the salivary glands which bring their secretions to the mouth cavity by ducts; there are three pairs of them, the *parotid*, *submaxillary* and *sublingual;* within the mucous membrane lining are many mucous glands. On the surface of the tongue are the taste organs.

The whole mucous lining is pink in color, showing the great abundance of capillary blood-vessels. Then there are lymph vessels and lymph glands. The walls hold muscles for various movements and blood and nerve supply for the chemical and mechanical activities.

The joints for the teeth as well as for the parts of the upper jaw are of the immovable sort; while that for the lower jaw is a perfect hinge-joint.

(3) The two cavities just studied open into the next cavity backward and downward. This is the throat or pharynx—see fig. (7). It consists of the well-defined parts referred to as the nose-throat, the mouth-throat, and below these the larynx-throat. The whole cavity is somewhat funnel-shaped; about four and one-half inches long and wider than thick. Its walls are muscular and membranous. *Seven* openings communicate with it—the *two posterior nares*, the *two Eustachian tubes*, the *mouth*, the *larynx* and the *œsophagus*.

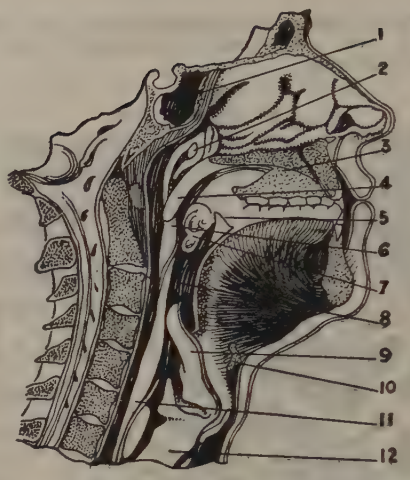

FIG. VII

A vertical section through the middle of the face, neck, and upper vertebrae.—*1*, Cavity in the skull; *2*, opening of left Eustachian tube; *3*, the hard palate; *4*, the soft palate; *5*, muscular wall in front of tonsil; *6*, muscular wall behind the tonsil; *7*, the left tonsil; *8*, pharynx, or throat; *9*, the epiglottis; *10*, the hyoid bone; *11*, œsophagus; *12*, the cavity of larynx.

In the side walls of the mouth-pharynx are the tonsils. These are rounded in form, about half an inch long, and about a third of an inch wide and thick, well imbedded in the walls and show the openings of twelve or fifteen crypts.

The whole cavity is lined with mucous membrane which varies in the thickness of its epithelial covering. In the nasal portion, the epithelial cells are ciliated, to help in the cleansing of the air on its way to the larynx and lungs.

The front walls of the larynx-throat are made up of the backwalls of the larynx and its epiglottis. Embedded within the walls are muscles to help in the swallowing process, i.e., deglutition.

The esophagus or gullet is the tube connecting the pharynx with the stomach. In front of the upper part lies the larynx, the base of the tongue with its hyoid bone; the *trachea* and esophagus and some large bloodvessels, the *thyroid gland* and large neck muscles—all in front of the cervical vertebrae of the backbone and surrounded by skin, together they make up the neck.

(4.) The base of the neck rests upon the top of the next large cavity that we call the *thoracic* or *chest cavity*. This, the fourth chamber of the series that makes up the great ventral cavity, is somewhat conical in shape and has for its foundation walls the thoracic vertebrae of the backbone and the ribs extending in ring-like fashion forward and slightly downward, meeting in front at the breast-bone or sternum, excepting the two vestigial pairs at the base that we call the floating ribs. These endoskeletal features give the chest a basket-like appearance, with the wide part down. The open spaces between any two adjacent ribs are filled in with muscles that help in the breathing process by increasing and decreasing the size of the cavity. All this is well covered by thick, finely developed skin, holding (1) sparsely-set hairs, coarse in parts, and (2) the mammary glands.

The floor of the cavity consists of muscles and their central fastening to the central tendon, all of which is called the *diaphragm.* From the outer edges of this, which are fastened to the ribs and spinal column, there is a decided curving upward, giving the floor of the chest quite a convex surface.

The upper end, gives the opening into the neck, allowing passage for the tubes and vessels mentioned in connection with the study of the throat, is quite constricted, as the figure shows.

The squarish contour of the chest, in spite of the features just described, is brought about by the arrangement and attachment of the shoulder girdle, as the figure shows.

So many controllable and uncontrollable irregularities occur from habits through ignorance of structural conditions at this spot that it is important to get clear ideas of arrangements here, and conform habits to such knowledge.

The lining of the cavity consists of *serous membrane* whose inner layer is an *epithelium,* called here *endothelium.* This makes the cavity moist, perfectly smooth, and air-tight.

Within the cavity are lungs, the greater length of the trachea and trunks of the bronchi. Between the lungs are set the heart and the large blood-vessels connected with it. There are special sacs encasing the lungs, called the *pleurae.* Another encasing the heart, called the *pericardium.* These are reflections of the membrane lining the walls of the cavity. The surfaces moving upon each other, because of expansion and contraction of the chest cavity, inflation and deflation of the lungs in the respiratory process, the beating of the heart in providing for the circulation of the blood, are protected against the wear, heat and pain of friction by the smoothness of these surfaces which protection is enhanced by the secretions abundantly made by the cell-glands within the membrane.

(5) Below the chest cavity is the *abdomen* or belly. This is nearly cylindrical in shape, has mainly fleshy walls held up by connection with the backbone, and the lower edges of the bony framework of the chest, the bottom edges resting on the upper rim of the pelvic cavity made by the strong, heavy bone structure of the pelvic girdle.

The skin covering the muscle and connective tissue is thick, strong, smooth, beset with fine hair generally, but with heavy and coarse hair along the mid-line well down near the base.

The cavity contains the *liver, pancreas, spleen;* the *stomach, intestines*—large and small; against the rear wall on either side of the backbone, are the *kidneys,* and the *adrenal glands* and their ducts; large blood-vessels, *lymphatic vessels* and *glands*; large nerve cords and ganglia and net-like sheets. The lining is a membrane covered with endothelium and called peritoneum, sending reflections into the cavity to enwrap organs moving on and over one another and against the walls; various forms of connective tissue; muscles and skin covering all, with distribution over some areas of fine hairs and over others, of course, heavy hairs.

The floor of the cavity consists of the widely flaring surfaces of the pelvic, the *innominate* or *hip bones* of the pelvic girdle. The central portion of this floor is the large opening into the next and last of the series of cavities and designated as the pelvic cavity.

(6) The cavity mentioned is the *pelvic basin.* The walls all around are bony—the rounded, irregular surfaces of the hip bone at the side; the curve of the group of fused vertebrae that we call the *sacrum,* curving sharply backward, tipped by the downward curving of the vestigial vertebrae making up the *coccyx.*

The cavity holds some loops of the small intestine, the *sigmoid flexure* of the *colon;* the end of the large intestine, called the *rectum;* the bladder and its ducts; the internal reproductive organs, their tubes and ducts, the ligaments, muscles and nerves. The series of cavities and their walls, from the throat downward, are frequently spoken of as the *trunk of the body.*

FUNCTIONS OF THE HUMAN BODY.

Now, turn your thought chiefly upon the fact that this is a living machine; that these structures have developed, are developing now, mainly by the use to which they are put, the functions they perform; that the combination of structures that make up the body as a whole is a result of nicely *coordinated, exactly timed* and *accurately* proportioned activities that taken together constitute *the life of an individual.* Looking over these activities, we find them amazingly numerous, complex, and often conflicting. And we see them as responses to stimuli coming out of the environment of the individual.

We also find *action* an absolute essential to life. We do not think of life without some kind of action. The larger, the greater, and richer the life, the higher the degree and quality and complexity of action—*doing.* In order to maintain life within a body, the body must continue to do. Look, for a moment, how varied and complex the doing.

We touch an object in our surroundings, and we feel. If the feeling is pleasant, we enjoy, i.e., are pleased with it and ourselves, and indulge in more of it. If the feeling is unpleasant, we are unhappy about it—want less or none of it and act to avoid it. In either case the result is motion within the body substance, and of the entire body, i.e., *locomotion.* This, of itself, may give its own pleasure or pain and bring pleasure or pain by the new contacts from change of position.

Whether pleasure or pain, the result is using up of energy and wearing out of body substance. This implies chemical and mechanical activity, reduction of energy, the formation of waste-matter. This makes necessary the formation of new body matter, living material, and of matter that is non-living and wholly different from body matter. It also means the replenishing of the stock of energy. This, too, brings its pleasure and pain and its motion, increasing the complexities by the interminglings. It means the removal of the waste matters, the replacement of this worn-out material by new, the constant alternation of accumulation and reduction of the stock of energy and so becoming unbalanced. The satisfaction in the whole series of activities may result in such extensive indulgence that there is accumulation of body matter and of energy. This is *growth.* For

probably all forms of life there is a definite limit to this in an individual.

But growth may be transferred to a new individual. *This is reproduction*—replacement of an old, passing generation of individuals by a new, coming one. This results in amazingly complex activities and wonderfully interesting life histories, relationships, and *springs of action.*

We may conveniently group these *actions* into four great groups of activities, naming these the *four fundamental vital functions.*

I. The Function of Sensation and its Apparatus—the *Sensory Apparatus.*
II. The Function of Motion—the *Motor Apparatus.*
III. The Function of Nutrition—the *Nutritive Apparatus.*
IV. The Function of Reproduction and its Apparatus—the *Reproductive Apparatus.*

Considering first the *FUNCTION OF SENSATION*, we may lay a good foundation for further study, by making a study of the body parts and their actions concerned in the simplest and most direct of the sensations—*touch.* When this is clear in mind, consider that from this fundamental process evolve the more complex senses like taste, smell, hearing and sight—all essentially touches, but the touching agents more subtle and demanding modifications of the former structure in adjustment to the more delicate touching, so that the essential similarity is lost sight of until careful thinking is done. The figure and its explanation in the legend should make clear the elements involved. The various parts of the drawing are not made to the same scale. The brain is drawn as though it were transparent. The whole drawing is purely schematic.

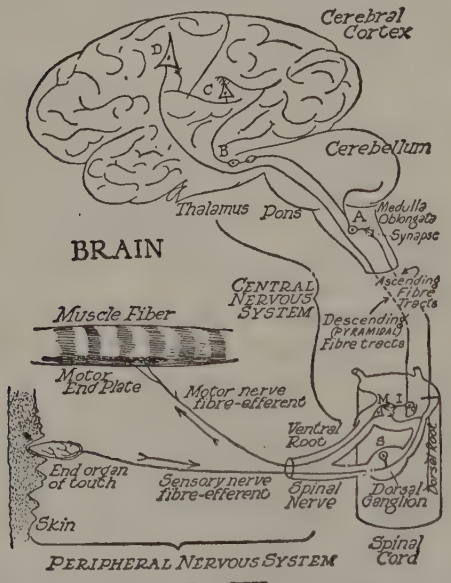

FIG. VIII

The end-organ of touch, in the skin, contains the endings of the dendrite from the sensory nerve cell *S*: stimuli from the skin are transmitted to the spinal cord along the fibre; they may go there directly or by way of the intermediate nerve cell **I**, to the motor nerve cell **M**, which sends nervous impulses down its axone, the motor or efferent fibre, to the muscle fibre, causing it to contract. This is *reflex contraction.* Nervous impulses from the sensory nerve cell may also be transmitted up the spinal cord to the nerve cells in the brain (**A, B, C,**) and may give rise to sensation.

Many connections exist in the brain (associative tracts), and as a result of the sensory stimulation the motor cells (pyramidal cells), **D,** of the motor cortex may be excited and send impulses down the cord thru the pyramidal fibre tracts, eventually reaching (through the intermediate nerve cell I) the motor cell of the spinal cord, producing a voluntary contraction of the muscle. Or, as a result of other connections and other stimuli, the motor nerve cells may receive nervous impulses which prevent its activity. This is called *inhibition.* Of the numerous possible courses those which are taken by the nervous impulses are determined by process of training and memory.

The illustration of the next of the Fundamental Vital Functions—*MOTION AND ITS APPARATUS*—shows the starting in quite a similar way and its expression so different that the outworking results in quite a different set of body parts.

Returning to the cut (FIG. VIII) a set of structures shows the machinery which we call motor end plates and the nerve connections translate a thought, a wish, a willing into motion, action or doing; also part of the machinery of reflex action. A bundle of fibres so constructed, placed and operated, and combined with many others like it makes a muscle. These muscles are fastened by connective tissue of various kinds to each other, and to the bones, and there, passing over their joints in the Endoskeleton, are the source of all the movements we make.

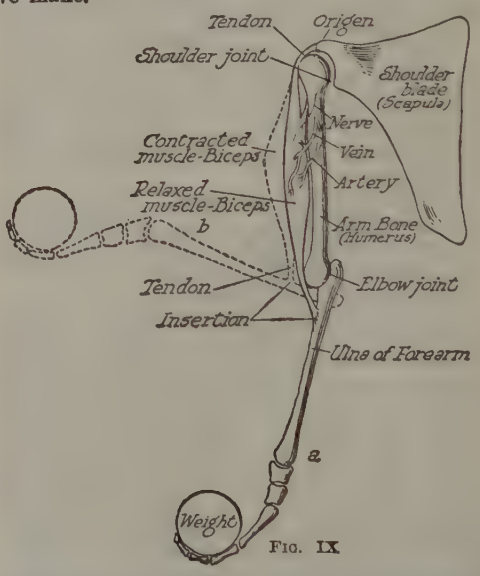

FIG. IX

The picture shows the biceps muscle and its related parts and is used to illustrate the action explained in the text.

TABLE I

FUNCTION OF SENSATION Consisting of PROCESSES	accomplished by	SENSORIAL APPARATUS Consisting of SYSTEMS
A. Reception	accomplished by	End Organs Touch— tactile corpuscles { bulbs of Krause; Pacinian corpuscles Taste— taste buds Smell— olfactory corpuscle Hearing— organ of Corti Sight— rods, cones } of retina
B. Conduction	accomplished by	Nerves..... { Process of Cells { Medullated / Non-Medullated; Fibers; Axis Cylinders; Medullary Sheath; Neurilemma. Ganglia—Cells and their processes. Synapses.
C. Central Reception and Interpretation	accomplished by	Nerve-Cells { Gray Matter; Ganglia

Central or Cerebro-Spinal { Brain..... { Cerebrum, Crebellum, Medulla } White & Gray Cortex and Fibers; Convolutions and Fissures; Hemispheres and Lobes Protection—Cranium; Membranes; Ventricles and Fluids. Cranial Nerves (12 pairs) and Ganglia. Spinal Cord... { White and Gray Matter; 31 pairs Spinal Nerves and Ganglia. Protections { Membranes, Spinal Canal, Cavities and Fluids.

TABLE II

FUNCTION OF MOTION* which is accomplished by the Consisting of a series of PROCESSES: These are*	accomplished by	MOTOR APPARATUS SYSTEMS: These are*
1. Nerve-end stimulation	accomplished by	Nerve end platelets.
2. Muscle contraction	accomplished by	Muscle fibres. Made up of muscle cells and their products, wrapped in sheath called sarcolemma, grouped into bunches called fibres; bunches of these are wrapped in membranes making fascicles; bunches of these are grouped, covered by fasciae, making a muscle; the body of the muscle substance makes the muscle belly, while the extended and united ends of the wrappings make tendon for muscle origin and insertion.
3. Moving a load, work.		Muscle is fastened over joints in the bones of the endo-skeleton. Freely movable joints, as hinge-joints like the elbow; ball-and-socket-joints as the shoulder Slightly movable, as the joints of the back-bone. By contraction and so shortening the distance between points of attachment the bones are moved because of the pull of contraction across the joint. By wonderful adaptation of these structural elements the amazing variations in movements and the superb skills as in playing musical instruments, ball-playing, dancing and the like are brought about.
4. Weariness, wear, repair	accomplished by	Lymph spaces. Lymph capillaries. Blood capillaries. The sense of weariness and exhaustion comes about largely through the mechanical and chemical breakdown of the muscle substance and its accumulation and change producing poisoning effects upon the muscle stuff. Removal through lymph spaces, lymph capillaries and blood capillaries and so getting the waste and poison into the blood stream and finally to the various excretory systems; at the same time the capillaries of the blood system bring a supply of nutritious stuff which is used in repair.

*After starred words read both *across page* and *down column*.

See the shape of the muscle in the cut; feel your own. Notice the origin and insertion, and the passing of the tendons over the joints. Return to the cut showing how nerve ends, tiny plates at the branching ends of the nerve fibre spread over various muscle fibres. Now, think of impulses coming to the muscle fibres, as there explained. Start them going in your own.

This causes the length of the muscle to decrease, that is, the muscle shortens. At the same time, since the amount of substance remains the same, thickness and width, must increase. Feel yours thicken and widen. The tendons do not stretch or contract, but the pull from the muscle is passed through them. The fore-arm's weight, plus the weight of the hand, plus the weight of the ball in the hand are raised from A to B.

In the same manner, by the same principle, all our most complicated movements are made.

The summary chart is not intended to give an exhibit of the large number of muscles in the human body (about 600), nor of the kinds, classified either as to size, shape, office or innervation.

A single illustration of one of the simpler types will serve for clearly thinking out the whole complicated machinery. This, of course, will be best done if one set of organs and their motions be taken up in the order given in the table, and immediately where possible studied from the parts of your body which in such study are caused to act for the sake of the study (see Table II, marked Funct. Mot.)

When you reflect that these actions are small, that the body parts doing them are microscopic in size, that every large act that we do is a total of many small acts and that every large body part performing these large activities, is made up of groups of many of these small parts, we are amazed at the smoothness and simplicity of the action. Then consider that every act, small or large, in taking place wears out the body parts performing it, and that this worn out part must be replaced by a new part; also that the worn out substance and the by-product of waste material—a chemical compound that is usually poisonous—whether gaseous, liquid or solid, must be removed in order that the newly made parts replacing the worn out and the waste, can properly function, you can readily understand the unity that is necessary to complete the smallest action and the amount of replacement that is always necessary.

This means supply of raw material, nonliving and of unfit structure and chemical makeup, and a whole series of complicated processes to make fit and to get into place. This constitutes the third of the Fundamental Vital Functions, the *FUNCTION OF NUTRITION*.

For illustration of the whole series of complicated processes we must limit our study to one of the simplest functions listed in the whole scheme.

The figure 10 shows a diagrammatic drawing of a small portion of a salivary gland, where one of the ingredients of saliva is made for use in mouth digestion. It shows a pocket of cells at the labelling alveolus, with a tube leading to the mouth, and surrounded by bloodvessels and lymph tubes, and entered by a nerve fibre. It is held in place by connective tissue of several kinds.

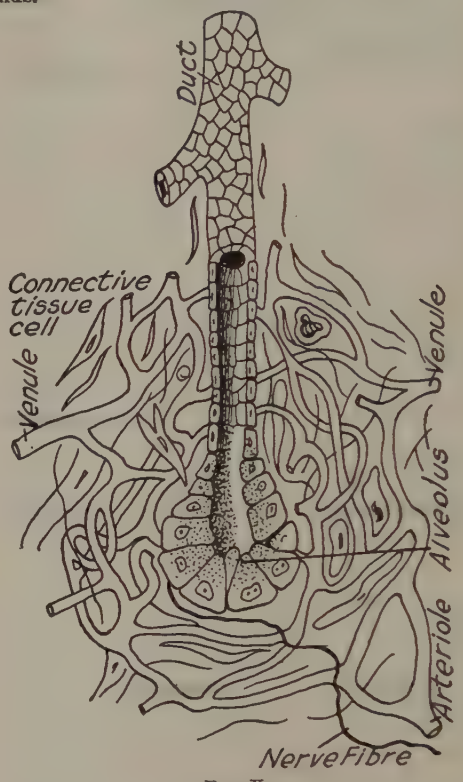

FIG. X

The cells making the walls of the alveolus can be seen holding granules. The material of these is derived from the blood and in the cytoplasm of the cells manufactured into saliva. This passes out through the tube and so gets to the mouth. Now, if you take an unflavored cracker, chew it well, and notice it becoming sweet, also disappearing without your swallowing, you may understand what we mean by digestion.

FIG. XI

TABLE III

I. FUNCTION OF NUTRITION* Consisting of a series of PROCESSES: These are*	accomplished by	NUTRITIVE APPARATUS Consisting of SYSTEMS: These are* made up of organs, which are constructed of tissues, and tissues are built up of cell and cell-products.
1. Mastication*

*After starred words read both *across page* and *down column*.

The fluid made by these cells is a chemical substance that changes the starch into sugar, that is why the cracker now tastes sweet, but in the mass of saliva it is dissolved and as a solution passes into the capillary bloodvessels lining the walls of your mouth just as you see in the figure, such bloodvessels making a network about the alveolus. They lie there so thick and are so full of red blood that the walls of your mouth are pink in color.

How does sugar get into the bloodvessels? How does saliva matter get out of the cells?

Look at the figure of the hen's egg set in a glass of water, after the shell has been picked open above and below without destroying the thin white sheet of membrane inside the shell.

There are no holes in the membrane, but notice that the membrane bulges outward; water has passed through the membrane, increasing the content. (See Fig. XI.) We call this *osmosis*, which means an exchange of heavier and lighter liquids through a membrane without rupture.

In the same way saliva stuff passes out of the cell, while other liquid stuff passes in, and in the blood-vessels of the mouth from the blood, through the walls of the vessels, without holes or rupture, liquid passes to the mouth; also the digested starch, now sugar solution, passes through the walls of the blood vessels into the blood stream.

The related processes that bring about the total result, nutrition, elimination of waste, assimilation, of the whole organism are approximately exhibited in the following table.

As previously said, an excess in the supply of manufactured material for replacing the worn out and the waste results in growth. Excessive growth is cared for by transfer to a new individual; this is the *FUNCTION OF REPRODUCTION AND ITS APPARATUS*, the fourth of the four Fundamental Vital Functions. The essential feature of reproduction is the coming together of two cells, each in itself incomplete, from two different individuals, one the male and the other the female. These are sperm cells and eggs and each incapable of coming to a new individual without the other. The poet's way of putting it is "useless each without the other."

Being formed in different bodies, the coming together of the two becomes an important problem; this is variously solved among the plants and animals, and goes a long way towards explaining the vast numbers of different kinds of bodies, also the varying behaviors and life histories.

In some, plants and animals, each sex produces its kind of cell and the individual gives itself no concern about the coming together of their products. Some female fish shed their eggs anywhere in the water and the male fish of the same species anywhere in the same water. The coming together of the two mating cells is a matter of chance.

In others, plants and animals, the female holds her cells in her body. The male of the same species becomes interested and is equipped with the desire and means to place his sperm cells where they can get to the eggs and so unite with them. It is easy to see that this is a source of immense variations in body, action and life history.

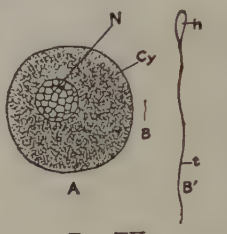

Fig. XII

A, ovum—a single incomplete cell from ovary of the female; B, sperm cell from the testis of the male; B, size proportionate to ovum; B', same enlarged; Cy, cytoplasm; N, nucleus; h, head; t, tail.

To become a new human individual these two cells must unite; the sperm enters the ovum and then very wonderful changes take place, and the two become one. This one is now an embryo, and destined to grow through many changes, recapitulating vast history and finally becomes a mixture of the characters of both parents, like the father in some respects, like the mother in others; never wholly like either. The characters of each are blended in ways that make each individual a new, unique character—nothing ever before like it, nothing ever again just like it.

Because of the need of coming together from different individuals, there are the differences in size and shape, also in power. The sperm is the smallest cell of the human body, the ovum the largest. The sperm is equipped with desire and an organ to go and find his mate. The organ is the tail. The ovum is loaded with food for the young that is to be—heavy and not provided with an organ of motion, but awaits the coming of her mate. There are vast numbers of sperm: there are relatively few ova.

PHYSIOLOGY—HYGIENE.

Anatomy has to do with the structure of the body or as it is known the organism.

Physiology has to do with the functions of the body or organism.

Hygiene refers to the understanding of both of these important studies so we can care for our bodies and understand them in order to increase their normal activities, at the same time preserving them and conserving their energies.

It is the duty of all intelligent persons over twelve years old to thoroughly recognize the necessity of being familiar with these three subjects. The first step then is to have an acquaintance with the physiology of the body, adequately understand the functions—(which is only another name for the mechanics or workings) of the organism so that any departure from what is natural or normal may be quickly recognized and corrected as well as keeping it fit when it is in good health.

PHYSIOLOGY OF MUSCLE AND NERVE.

The notable feature of muscle is the power of contraction. There are small cells in the body called Cilia that also possess this property but in the main it is muscles that have the power of contraction. The muscle tissues are divided into three divisions from a functional standpoint. It is to be understood in Physiology that when the term function is used it means the special action of that tissue or gland, in contradistinction to the word organic, which means the special structure of the individual organ or tissue.

The three groups of muscle are named *Striated Skeletal Muscle, Plain (Smooth) Muscle* and *Striated Heart Muscle.*

SKELETAL MUSCLE.

Skeletal Muscle produces the voluntary movements or those under control of the will. Each muscle is composed, of course, of many fibers. Each one of these fibers is held in a little bag or membrane and this is called the *Sarcolemma.*

Muscles possess the two qualities, *extensibility* and *elasticity.* They stretch from bone to bone and are always, so to speak, in an elastic state of stretching or tension. This is referred to as muscle tone. A muscle acts better to stimuli when it is in this elastic state of tension than when altogether relaxed. In the body muscles are placed in sets of *extensors* and *flexors* and they are antagonistic to each other. This delicate balance of elasticity and tone is not only beneficial here but also must be maintained in other kinds of muscle as for instance the heart muscle and the muscular coat of the arteries.

Muscles are made to contract by a stimulus sent down by the brain through what is called a motor nerve. If anything severs or interferes with this nerve the muscle is paralyzed and will not act. A muscle, however, has an independent irritability and will contract if an electric current is made to come in contact with it. If you push the stimuli to a muscle too rapidly it will come into a state called muscle fatigue and by and by will not act. In other words, a muscular structure requires a certain latent period or resting time to pick up its tone again. Before a muscle passes into a stage of fatigue, it will sometimes stay in a fluttering condition of constant contraction, this is called compound contraction or tetany. In death the muscles pass from a viscous to a solid state, this is called *Rigor Mortis.* All muscles do not develop it alike. It usually starts in the jaw and descends downward.

PLAIN MUSCLE (Smooth)

This is located in the walls of the organs like the stomach, in the arteries and veins, the digestive canal, in the genito urinary organs, the windpipe, and in the eye ball as well as the muscles of the hair. It is not under the control of the will generally speaking. They are regulated by reflexes or unconscious stimuli from the brain. The sensitiveness of this type of muscle is more sluggish in its reaction to stimuli. The heart muscle is classed in this type but it is more rapid in its actions and also possesses an individual quality of rythmic action not possessed in like degree by other members of this class.

NERVE FIBER.

The nerve fibers of the body are divided into two classes called *medullated* and *non-medullated.* The brain and the spinal cord, the cranial nerves, and the roots of the nerves along the spine are classed as *medullated.* All these structures have a core called an axis cylinder and surrounding this core is a sheath. This sheath is divided every so often. Around this sheath is a very delicate coat called the *Neurolemmal Sheath.* The other division of nerves do not have this medullary sheath. Nerves going to an organ are called *efferent.* Those leaving the organs and carrying impulse to the brain are called *afferent.*

Furthermore, nerves which carry motor impulses or stimulate to action, come out through the front or anterior roots in the spine while those bringing back sensations come through the back or posterior roots. Various agencies stimulate nerves.

(1) Chemicals,
(2) Mechanical means,
(3) Heat or cold,
(4) Electrical stimuli.

There are certain spots in the body where voluntary muscles can be especially well stimulated. They are called Motor Points and are where muscle receives its Motor Branch. The nature of the nerve impulse by which nerves contract or otherwise affect an organ is supposed to be in a form of matter akin to electricity or its associate form the electrons.

When a nerve trunk is killed or divided all that part of the nerve beyond the division dies or degenerates. If the nerve can be reunited it regenerates. The process of divided nerve is similar to the relation of central telephone office and your telephone, cut the wire and the usefulness of the telephone is immediately lost.

CENTRAL NERVOUS SYSTEM

All the processes of this system are related by a unit called the **neuron.** The neurons are supposed to communicate by contact only. These neurons resemble spiders with the branches representing the legs. As in the case of muscle cells and almost every other cell in the body, they must have their "resting" or relaxing period. When nerves are spoken of as having reflex action it means they are acting independently by carrying afferent (organ to brain) impulses to the brain. As for instance, the eye sees an insect coming toward it and the lids close before the individual has time to think it out. This is utilized in examinations as for instance when you are asked to cross one knee over the other, examiner taps knee cap, your knee jerks forward. The brain and the spinal cord are nothing but a big assemblage of nerve cells and nerve fibers. These are divided into grey matter and white matter. In general the gray matter originates the thoughts and nerve impulses. The white matter carries them along.

The cerebrum, divided into two halves or hemispheres, has various spots or areas that do certain things. Part of it is intellectual so to speak. Part of it controls the limbs, part of it the eyes and so on. If any one of these parts

are struck in such a way that they are killed or by being pressed on by blood or fluid or by degeneration through tumor or disease, they cease to function. This explains the phenomena of paralysis. For instance if the leg center is pressed then paralysis of the limbs occurs. These impulses pass down through the lower portions of the brain, that is, through the cerebellum, the pons, and the medulla-oblongata. These impulses, from the centers, rule over the heart, lungs, and control the temperature of the body. The *vaso motor* nerves are located in a locality known as the fourth ventricle at the base of the brain. As part of the nerve fibers cross in the medulla oblongata it explains why when you are hit on the left side of the cranium the right side becomes paralyzed. These nerve fibers are arranged in the form of bundles of wires and are called tracts.

Various diseases pick out different tracts as for example, *Infantile Paralysis* picks out the front, therefore is called *anterior Poliomyelitis*. *Locomotor Ataxia* picks out certain fibers relating to locomotion. A disease called *Multiple Sclerosis* selects spots here and there. *Parésis* affects the grey matter of the brain. *Aphasia* or loss of speech may come from degeneration in the motor nerves that stimulate action or the sensory nerves that convey impressions.

CRANIAL NERVES

There are twelve cranial nerves and these all have special functions. They arise as direct offshoots from the brain.

(1) Olfactory or nerve of smell.
(2) Optic or nerve of vision.
(3) Supplies motion to the eye.
(4) Supplies motion to the eye.
(5) Supplies teeth, nose, eyes, face and is the one chiefly concerned in facial neuralgia.
(6) Supplies motion to part of the eye.
(7) Supplies motion and receives sensations from the face.
(8) Nerve of hearing.
(9) Taste, sensation, motion.
(10) A very important nerve going to the lungs, heart and digestive organs. It is probably one of the most important nerves in the body and any interference with its function results in many of the serious ailments related to disease of these organs.
(11) Supplies motion to some muscles of the neck.
(12) Supplies motion to the larynx and the tongue.

Anything interfering with the function of any one of these nerves will cause pain or paralysis of their function. Degeneration of optic nerve causes blindness, of auditory nerve loss of hearing. Interference with the tenth induces heart disturbances. Paralysis of the twelfth brings on difficulty of speech and so on. *Syphilis* has a great tendency to affect these nerves, particularly those supplying motion to the eye.

There is another large mass of nerve fibers connecting many important structures and spread out like a web in and about the spinal nerves to the various organs. It includes the often alluded to *Solar Plexus*. While not strictly speaking altogether sympathetic in the usual meaning of that term, it is nevertheless called the *Sympathetic System*. This system was formerly supposed to be independent of the mind but it is now felt, that they are not free from voluntary control and that, therefore, worry, habits, mental disturbances can affect partially, at least, the activities of this great webbing of nervous tissue binding together so many important organs.

SLEEP.

No definite theory as to what causes sleep has as yet been accepted.

SPECIAL SENSES.

There are in the body nerves specialized to sensations. We understand these best on the skin. The four leading forms of sensation are: namely *pressure, warmth, cold* and *pain*. The deeper organs seem only sensitive to pressure and pain in a slight degree and are not sensitive to either touch or temperature. The pain sense is the most widely distributed. It is supposed to be related to the irritation of so many "pain points" located in the nerve distribution. The muscles have a muscular sense. It is probably used in judging weight and resistance. We have the sensation of hunger which probably is partly due to the so called hunger contractions of the stomach. Hunger may be disagreeable. Appetite on the other hand is located in the nerves of the stomach and is usually pleasant. Thirst is probably located in the nerves of the pharynx and whenever the water content becomes too low these nerves are stimulated. The nerves of taste are supplied from two sources. The front two-thirds from the fifth nerve. The back, one-third from the glosso-pharyngeal nerve. There are also taste buds scattered about in the throat which are supposed to be auxiliary to the main nerves. This makes the sense of taste not entirely dependent on any one nerve. The four main taste sensations are *sweet, bitter, sour* and *salty* and all others are combinations of these. There are also combinations of taste sensation with those of odor. Common sensibility of the tongue also enters into it as in the case of pepper and alum. If we hold our nose during ingestion of food certain tastes will disappear. Very disagreeable tastes are usually bad odors.

SMELL.

It is generally supposed that the sense of smell is caused by small particles of the matter detected, floating through the air at least in a gaseous form and striking the olfactory membrane. Odor is largely a matter of association and has a large measure of the psychological in it. For instance musk is pleasant to some and very unpleasant to others as is also garlic. The sense of smell may be fatigued. The sense of smell is highly developed and the very small particles that affect it are almost beyond belief. The dog especially has a high sense of smell. Two odors may neutralize each other as for instance Balsam of Peru and that of Iodoform.

SIGHT.

The eye is, of course, the organ of vision. The eye is an optical instrument that catches

rays of light emanating from external objects, brings them to focus on a curtain of nerve fibers, the retina, which in turn gives the sense of sight to the brain by a series of special impulses.

Through a window called *cornea*, the rays are passed through a complex curtain called the *Iris* which has the power of becoming larger or smaller according as the light is too bright or too dim thus varying the aperture (called the pupil) in size of opening. The light is caused to come to a focus by a clear lens called the *crystalline lens* (opacity of which is a cataract) which has the power of adaptation to distance and is then thrown on a curtain similar to a stereoptican background which curtain is called the *retina* and is alluded to as being composed of *rods* and *cones*. The impression is transmitted to the brain through the optic nerve. Defects of vision can occur anywhere in any of these structures but failure of the crystalline lens is probably the most common in which case one wears glasses which make up for the defect the crystalline lens cannot correct. However, the cornea can also have its share in astigmatism. The *iris* or curtain can be affected by many drugs. When it is constricted it is called *Miosis*, when dilated *Mydriasis*. Atropin (Belladona) and Cocaine dilate the pupil while Eserin Pilocarpine constricts the opening. The instrument for examining the eye is called an *opthalmoscope*. Certain people do not react to the sensations of color, particularly red. This is referred to as color blindness.

HEARING.

The ear is divided into three main parts. That outside of the drum or *Tympanum*. The middle part containing the bones of hearing (hammer, anvil and stirrup, named for their respective resemblance) with ligaments and muscles and a connecting tube the Eustachian canal which connects with the throat and serves to equalize the air pressure on both sides of the drum membrane. The internal ear with its organ of sensation, the *Cochlea*. Its vestibules and semicircular canals making a structure called the *Labyrinth*. The sound waves strike the ear drum, are transmitted to the bones and in turn are carried on through a very delicate and complex system which selects different waves in the internal ear to the auditory nerve and thence to the brain.

The importance of keeping the Eustachian canal open is apparent and its occlusion in nose and throat affections account for the buzzing in the ears. On the other hand, the importance of micro organisms or germs passing up through it from the nose and throat accounts easily for the prevalence of ear troubles during epidemics of nose and throat diseases. Different people have various ranges of hearing as in the case of smell and sight. The semicircular canals are concerned also in giving us a sense of proportion and direction. Interference with them makes us dizzy and gives us *vertigo* and *nausea*. They are the supposed causes of sea sickness and car sickness.

BLOOD AND LYMPH.

The blood is the fluid which is kept in circulation by the heart. It flows through a series of tubes known as the arteries, veins and capillaries, and keeps up the nutrition of the body. Its functions are varied. *First*, it carries the food after it has been prepared by the digestive organs. *Second*, brings oxygen from the air to the lungs. *Third*, carries away the products of combustion, so to speak, of this same oxygen designated as carbonic acid gas and other waste products from the tissues, as for instance, the nitrogenous compounds Urea, Uric Acid and similar material. *Fourth*, distributes the various secretions of the glands and internal organs. *Fifth*, maintains the temperature of the body, as well as preserves the proper balance of fluid.

The blood consists of a fluid part, the Plasma, and in it floating, so to speak, a number of minute bodies, the corpuscles. These corpuscles are further divided into three groups; namely the *red corpuscles*, the *white corpuscles* (also called Leucocytes) and the *Blood Plates*. The Plasma is colorless or with a greenish yellow tint. The red color of the blood is due to the red corpuscles. Blood coagulates on exposure to the air. This is due to the spontaneous formation of a fibrinous product which is a special endowment and is dependent on the existence of a ferment-like substance fibrinogen associated with lime salts.

People whose blood does not possess this quality of coagulation are described as having Hemophilia and are in grave danger from bleeding to death following injury or operation. For this reason one should have a "coagulation time" test taken on him before submitting to operation if there is any doubt at all about his possessing the coagulating quality in his blood.

Blood is alkaline not acid in reaction to litmus. The red corpuscles in health average 5,000,000 to an arbitrary standard, the cubic micro millimeter in males. 4,500,000 in females. They carry an iron compound *Haemoglobin*. Their function is to carry oxygen gas which unites easily with this iron compound. When a person goes to a laboratory to have a so called "red count" made, it is to determine how near to the normal number of 5,000,000 he happens to possess. A low count is indicative of the condition *Anaemia*.

The white cells called Leucocytes are more complex than the red. They number about 6,000 to 7,000 per cubic millimeter. If an individual goes to a laboratory to have a so called "white count" done, it is to estimate the number of these white cells. In many conditions, notably acute Appendicitis, the number is greatly increased to 15,000 to 20,000. While in Pneumonia, it may reach 35,000 to 50,000. If a patient has pain in the region of the Appendix and a count of 15,000 to 20,000 is obtained, it is practically certain he will have an abscessed Appendix. The blood is obtained by pin prick from finger or ear. A high count is known as Leucocytosis. In Typhoid Fever, you have a low count and this is known as Leucopenia.

White cells have a power of movement all their own and this has earned for them the name of wandering cells. They can go through spaces between the other body cells as for instance the bloodvessels. The white cells:

(1) They protect the body against so called micro-organisms or germs. They either

ingest them or else destroy them. This has earned for them the term "policemen of the blood."

(2) They aid in absorbing fats and peptones from the intestines.

(3) They aid in coagulation.

(4) They help to maintain the so called proteins in the blood.

BLOOD PLATES.

They occur in great numbers in the blood, 300,000 to the cubic millimeter. Their exact use is not understood.

Blood is a complex fluid and is not a simple compound. Its reaction, contents, amount of protein (white of egg is a class of protein) and clotting features are specific for any individual. Blood transfusion cannot, therefore, be done indiscriminately. The blood of one healthy individual may be toxic or poisonous to another. Likewise, serums obtained from other animals may be toxic to a man. In order to combat this feature, it is usual in giving the blood of one person to another, to type them and examine them so as to find out whether they measure up approximately alike. No one should receive blood from another person unless the giver or donor is known to be of their type, unless it is in the case of grave emergency, and known that the donor is free from Syphilis.

LYMPH.

The Lymph is the other fluid of the body found in the system of corollary tubes to the blood circulation, known as the *Lymphatic System* as well as in certain open spaces outside of the bloodvessels. All tissues are probably bathed in this fluid Lymph. They, the Lymphatics and the Lymph spaces, are really a sort of *"Clearing House"* between the blood stream and the tissues.

CIRCULATION OF THE BLOOD.

To understand the circulatory apparatus, it is well to consider it as an organ of the body in itself. It is in endless motion, which never for a moment stops from birth to death, yet it is not the same in all parts of the body. In one part as for instance the carotid artery, it may be traveling at a high velocity, yet in another it may be moving very slowly as in the microscopic vessels, the Capillaries. The time necessary for a complete circulation of the blood is usually stated as 23 seconds.

The pressure of the blood is not the same in all individuals and is produced by pressure waves (like the waves of a stone falling into a pond) induced by the alternate contraction and expansion of the heart and its effect on the blood in the arterial vessels.

The maximum or highest point is obtained by the action of the heart in contraction known as *Systole.* This is the apex of the pressure and is called *Systolic.* The lowest or minimum pressure is obtained after the heart has rested and is known as *Diastolic* pressure. In man this is about 110 to 120 millimeters measured on a mercury column for the Systolic or high point while the lower or Diastolic is between 67 and 75 millimeters. Subtracting one of these from the other gives the so called pulse pressure. Therefore, a man with this blood pressure has a heart beat which has a force equal to lifting a column of mercury in a tube 45 millimeters high. This is what taking your blood pressure actually means. Anything which makes the resistance to the blood flow greater will cause the heart to increase the force of its beat.

THE PULSE.

When the heart throws the blood into the arteries, if they were hard and rigid, then the pressure would be the same everywhere in the body and as much blood would have to flow into the heart as flowed out from it. This is not the case. The arteries are soft, compressible and elastic. They fill up near the heart and pass the pressure along in a series of snake-like movements until finally in a feeble way it reaches the most distant parts of the body. In so called hardening of the arteries seen in the aged and those with *Arteriosclerosis* from disease, this remarkable property is to a more or less degree lost with the result that a variety of untoward symptoms arise interfering with comfort and health. Whenever an artery comes to the surface and is easily felt this blood pressure wave or pulse may be detected. If this wave occurs regularly it is called a *regular pulse* or wave. If in good tune, it is called *rhythmic.* If soft, compressible and elastic it is said that the *tension* is good. If a normal quantity of blood is evidently passing along with each wave it is said the *volume* is good. If life insurance or other examinations are made these are the terms used to describe the pulse.

HEART BEAT.

The heart is divided into four rooms or chambers. The two upper or receiving chambers are called *Auricles.* The two lower or chambers of pressure activity are called *Ventricles.* A heart beat consists first of the squeezing in or contracting of the upper or filling chambers. Next a squeezing in or contracting of the emptying chambers and then a rest when the blood is again running into the heart. Activity is known as *Systole.* Resting is known as *Diastole.* The beat begins in a bundle of nerves at the upper portion of the heart and spreads out over the heart like the wind setting in motion a field of wheat. It is not a sudden spasmodic action. Many heart diseases are the result of interference with this spreading wave. This wave is accomplished by the action of different nerve nodes like the lighting progressively of the bulbs on an electric sign. Interference causes serious trouble as in the case of heart bloc when the impulse is stopped or in fluttering where it acts too often in one part. Valves between the chambers and vessels, keep the stream from flowing back in the wrong direction while the squeezing of the walls in contraction is going on. If at any point through disease these valves do not fit tight leakage occurs in the wrong direction. While the ventricles are in action, two sounds are to be heard over the heart, one at the beginning, the other at the end of the action. It resembles "lubb-dup." A stethoscope

intensifies these sounds. When heart sounds "lubb-dup" are replaced through disease by soft purring-like sounds these replacements are designated as murmurs. They are useful in ascertaining just what portion of the mechanism is at fault. But these so called murmurs are not accepted with the same finality and importance they once were.

The cause of the heart beat consists of impulses sent down by the central nervous system from the center designated as being in the fourth ventricle of the brain. Those to hasten it are described as coming through a nerve, the *Cervical Sympathetic.* Those to retard it through the *Vagus* or 10th cranial nerve. If either one of these nerves are paralyzed or interfered with by disease or accident or drugs the other will gain the ascendency. Cut the *Vagus* and the heart will run away with itself. Interfere with the sympathetic or acceleration nerve and the heart will beat too slow. While the nerves above mentioned start or regulate the contraction they have nothing to do with its rhythm. It is, therefore seen, that the heart is an automatic organ. It needs to be started but runs on itself.

The rate of the heart beat varies.

At birth	135 to 140
Infancy	120
Childhood	100
Youth	90
Adult	75
Old age	70

Exercise increases it. Blood pressure affects it. Low pressure increases it.

VASO-MOTOR NERVES.

There are in the coats of the blood vessels a series of nerves which dilate them or constrict them as necessity arises to maintain normal blood pressure. These are absolutely essential and very important. One set is designated as *Vaso-Constrictor* and they diminish the size of the bloodvessels. They are seen in action when the face grows pale. The antagonistic set are the *Vaso-Dilators.* They are seen in action when we blush and they open or dilate the blood vessels.

These constrictor nerves are in constant tonic activity. They have their center in the brain and it is known as the *Vaso-Motor* center. The center of the dilators is not so well made out. These nerves have a great deal to do with our bodily welfare. They are concerned in surgical shock after operations, in fainting, in various skin diseases, in the actions of many drugs, in the disease known as *Hypertension* and in the symptoms of high blood pressure. They maintain the equilibrium of the circulation giving to a part that needs it, more blood and withdrawing it from others that do not. They can literally make a man "bleed into his own veins." They are an important adjunct to the heart and are almost as necessary to our lives as that important organ.

RESPIRATION.

Respiration relates as a rule to the process between a body and its surroundings, of the interchange of some form of gas. In the human being this consists in the absorption into the blood of oxygen and the elimination outward of carbonic acid or carbon dioxide gas. From the time we are born until the period of our death this process of changing of gases must go on. It may, apparently, stop for a short period as when some one is resuscitated from drowning or during an anaesthetic, but even then it is a matter of using up a residual or reserve air, that the lungs always hold, which carries the injured over the hazard.

It may be said therefore to be a constant process like that of the heart beat. We must have fresh air. The only way to come to a clear understanding of the breathing in of oxygen is to remember that the gas oxygen is in reality like food. Ordinary food is taken into the stomach. Oxygen by way of the lungs. The bowels must move to eliminate the waste of rough food—the ashes so to speak. The lungs must bring back that Carbonic acid gas to the outer air as the ashes of the gas oxygen. In the last analysis the results are quite the same, except that in an emergency we can go without food for the stomach while we cannot go at all without food for the lungs else we die of asphyxiation.

So we come to understand that the *metabolism,* (which is to say changing of matter like food into living tissue of the body) is simply a process by which fats, sugars, proteids and salts with water on the one hand and on the other the gas oxygen are taken into the body, and turned into living tissue. What is worn out and of no further use is eliminated, the foodstuffs by bowel and kidney, while the gas comes away through the lungs as carbonic acid.

The interchange of gas occurs in the lung, where a myriad of little cells like the compartments of a honey comb or automobile radiator are lined with veins and arteries. The bloodvessels bring the blood impure with carbonic acid gas so that it is dark in color, and give the gas over to the air in the little air chamber. It is taken up, oxygen is furnished in exchange and the blood goes on its way purified, bright red in color. This process of purifying is often referred to as *ventilation.*

The lungs are two large organs arranged in lobes. They operate like bellows. They are in two closed cavities which are encased in the thorax. A vacuum exists between the sides of the chest wall and the covering of the lungs. This makes the pressure coming from within the lungs greater than that between wall and lung. As we take air into our lungs it is referred to as *Inspiration* as we breathe it out it is called *Expiration.* The action of *Respiration* is carried on by the big domelike muscle that resembles the ceiling in a cathedral and which separates the lungs and heart from the stomach, bowels and liver, also by the bringing up or elevating of the ribs. Also by the various muscles of the chest.

Ordinary breathing is called *quiet breathing.* Difficult breathing is called *dyspnea.* Breathing is also referred to as *costal* in which the chest is predominant, abdominal, when that portion of the body is the chief factor. Artificial respiration is that carried on by a force outside the body. An instrument, *THE PULMOTOR,* auto-

matically does this. It is however frequently not around when needed. Two other methods are in common use. The *Sylvester Method* is as follows. Raise arms above chest then lowering them down against the sides of the chest so as to make pressure inward, releasing, and the same procedure over again. Do not hurry. Do it less often than one would breathe or about 10 to 15 times a minute, holding tongue forward.

The *Schafer Method* is done with less labor and as it may have to be carried on in some cases of drowning for almost an hour this feature is of some importance.

Patient lies face downward, be sure tongue is out. Pad under chest. From a point at hips operator straddles body, facing head, places both hands over lowest ribs called *diaphragm*. Throws weight of his own body against hands. Slowly sits up again without removing hands. Do not hurry. Do it 10 to 15 times per minute.

As was stated before a vacuum exists between the lung and chest wall. If air rushes into this vacuum, or enters from a puncture through the lung inside or chest wall outside, the lungs immediately shrink. This condition is known as *Pneumothorax*. It is utilized in Tuberculosis to rest the lung. The lungs are supplied with nerves from various sources. The most important is the *Phrenic* in so far as it innervates the diaphragm. Numerous nerves go to the various muscles. Ordinarily breathing goes on involuntarily in a rhythmic manner, but to a limited extent breathing is under voluntary control. But we cannot hold our breath beyond a certain point therefore an infant cannot come to grief in this way.

Holding sway over the whole scheme of Respiration is a center in the brain called the respiratory center. It is located under or in the medulla oblongata. This center acts almost automatically, so that if you are threatened with lack of air or asphyxiation, the carbonic acid rising into a condition of excess you breathe faster. The excitation of any sensory nerves will stimulate this center. So that a cold bath, pain, grievous sights, annoying sounds will all make one breathe faster.

The interchange of gases in respiration is always affected by pressure. Atmospheric pressure is quite a factor. People going down in deep sea work, or those engaged in building tunnels or caisson work must avoid too rapid changes from low to high or high to low pressure. Caisson sickness has to do with high pressure. Mountain sickness with low pressure. In all that pertains to Respiration the main thought never to be forgotten is that fresh air is a *necessary food* which we cannot possibly do without for a moment. Furthermore the air we inspire should be on the move so to speak and not stagnant. There can never be any argument as to whether we should have fresh air. Being a continuous necessity it must then be ever present.

PHYSIOLOGY OF DIGESTION AND SECRETION.

Mastication is entirely a matter of the will. Reasonable time should be taken for it. Deglutition (or swallowing the food) is at first voluntary; later it is not.

At the upper end of the wind pipe is a sort of cap or valve known as the epiglottis which shuts off the food from going down the windpipe.

The cardiac (heart) end of the stomach has a *Sphincter muscle* (a valve) which is open when food enters; is closed when the stomach is full.

The stomach of man is a single organ. However different parts of it act differently. The two main parts are the *Fundus* with the main body and the *pylorus* or smaller lower end. The lower end has the pyloric valve which allows food to escape when it has been properly prepared. The stomach has three layers of muscles, *longitudinal, oblique,* and *circular.* They give it a churning movement pulling as they do in different directions. The upper part of the stomach acts more as a reservoir while the active mixing and digesting is carried on in the lower end. Food of a solid nature may remain for quite awhile but liquids are passed along with celerity. The stomach fits around the food within it. Different kinds of food have a different period of residence in the stomach. Starches which are not digested there pass out in half the time of such foods as meat and the like which the stomach digests. The stomach therefore is a large receiving organ for food which it ejects at stated intervals into the duodenum. Food such as we eat could not be directly thrown into the intestines, they are in no sense large enough to receive it. The stomach receives its nerve supply from the vagus and the splanchnics (sympathetic). It is however something like the heart, an automatic organ.

THE INTESTINES.

The bowels have two muscular coats, an outer lengthwise or longitudinal, and an inner round and round or circular. Like the stomach they have an inner soft velvet-like layer called the mucous coat which absorbs the food.

Two kinds of movements are brought about by these muscular coats. First, *peristalsis*, this is a constriction of the walls. It works in segments like a block signal system on a railroad and has the effect of squeezing the food or residue on from part to part. Food passed through the small gut takes about 4 to 6 hours, and after a full meal the chances are it is spread along its whole length.

The second kind of movement is the *rhythmic* movement and it operates not so much to push food along but rather to separate it and re-unite it into small masses. This aids in digestion and also forms the stool.

The nerve fibers of the intestines have not altogether been clearly made out. Like the splanchnics, the vagus and other extrinsic nerves they have their specific effects. The intestine like the stomach is classed as an automatic organ.

The opening of the small into the large intestine is controlled by a valve, the *ileocecal*, and by a sphincter (like the rectum). The large intestine is something of a reservoir and in civilized man its place has been taken by the modern cook who prepares the food so that the roughage that normally was collected in this organ is either broken up or removed altogether.

The nerves of the large intestine come from two sources, (1) from the lumbar nerves (2) from the sacral nerves.

DEFECATION.

That part of the undigested and indigestible portions of food with other wastage and secretions not used up reach the bend in the large intestine known as the *Sigmoid Flexure*. The rectum is thought not to hold the fecal matter for long under normal conditions. In reality under civilized life the probabilities are that it does.

Two sphincters or valves hold the fecal matter in the rectum. Defecation is partly voluntary and partly involuntary; part is carried on by the abdominal muscles. They increase the pressure. Defecation is however mostly involuntary and is carried on by a nervous reflex.

VOMITING.

Ejection of the contents of the stomach up into the mouth by way of the esophagus and to the outside.

It is a reflex nervous act and the abdominal muscles assist. The cardiac end of the stomach is opened while the lower end contracts. It is as before stated essentially nervous, caused by irritations to the brain, disturbances of the sense of position by way of the ear labyrinth, irritation of the stomach wall by products of fermentation or by emetics. Also by reflexes, through connection with the uterus, liver, kidney and other organs. Morning sickness in pregnant women is due to this reflex activity. It is supposed by many that there is a definite vomiting center in the brain. The drug apormorphine which, when injected directly into the body promptly produces vomiting, possibly acts on this center.

FOODS AND THEIR DIGESTION.

The substances we require to keep the body properly nourished are foods. There is a wide range of various foods on the face of the earth. However they can all be reduced to five essential elements.

PROTEIDS
WATER
CARBOHYDRATES
SALTS
FATS

Withdrawal of any one of these, especially water and the mineral salts, spell injury and even death to the body. In any of our bodily ailments it is merely a question of too much of one and not enough of another. Some of the most serious skin diseases represent an absence of one or the other. Dietetics and the science of food selection with their series of charts and figures merely represent the amount of which each one of the foods contain of these five elements. Animal foods have large quantities of proteins and fats. Vegetable foods have large amounts of carbohydrates and water. Some vegetables like peas however have even more protein than meat. To understand the word protein, is to recall the white of an egg. To understand the word carbohydrate is to recall starch and sugar. Fat is fat. The animal foods are more completely digested than the vegetable as the latter has shreds and fibers of cellular or fiber-like material.

There is another element in food known as vitamines. They are not as yet capable of being separated or isolated.

FERMENTS AND ENZYMES.

Ferments are as a rule living collections of organisms. Enzymes are the non-living unorganized elements which produce actions of a fermentive character. The first enzyme we meet is that of the salivary glands. It is called *Ptyalin* and it has an action on starchy foods. The salivary glands have secretory functions and these determine the flow of saliva.

Certain drugs act very definitely on this gland. *Atropine* or *Belladona* paralyzes the nerve of the salivary gland causing dryness of the mouth. Nicotine likewise lessens it.

All normal activities of the stomach so far as action on the food is concerned and for breaking it up into substances fit for absorption are directly produced, by fermentation. It is an error to ascribe certain conditions causing flatulence and so called "Gas" to enzyme action as a general term. It may be that the wrong food is fermenting into undesirable compounds but fermentation is normally present in the stomach.

Pepsin is the enzyme of the stomach. Like all other enzymes and ferments it acts without destroying or lessening itself. However pepsin must act in the presence of dilute hydrochloric acid, so that normal gastric juice is always acid and sour. It is to be remembered that enzymes that act on one kind of food cannot act on another. The gastric juice and the enzymes are secreted by many tubular or goblet-like cells in the velvety mucous membrane. The ferments are probably induced to flow by nervous impulses first started when food enters the mouth.

The gastric juice has also a milk changing ferment called *Rennin*. Rennet was used in olden times to make cheese and was obtained from the calf's stomach. It is the same as that of man. So it is to be expected that whenever milk which has been ingested for a time, is vomited, it will come up in the form of curds. Proteins are digested, water, some forms of sugars but not many, alcohol, drugs, and mineral salts are absorbed in the stomach. It is not as rapidly done as is generally supposed.

DIGESTION AND ABSORPTION IN THE INTESTINES.

Most of the more elaborate digestion of food is done in the intestine and here most of it is absorbed. Intestinal digestion begins at the duodenum and is nearly completed by the time it reaches the end of the small intestine at the ileocecal valve. Three juices enter into the process. The *Pancreatic*, the *succus entericus* (secretion from intestine) and the bile.

The pancreatic juice comes from the pancreas. It is not the secretion concerned in the disease Diabetes. It is like the gastric juice concerned in digestion only. It has a number of properties and secretions. First is a substance *secretin*. The next secretion is that of *Trypsin*. It also digests Protein but it acts in alkaline as well

as neutral and acid conditions. The next is *Amylase* which is the ferment which acts upon starches changing them into sugars. Starch as such is absorbed. The next is *Lipase Steapsin* which digests fats, changing them into emulsified forms similar to soaps. The action of the intestinal juice is not as yet thoroughly understood. All the food not absorbed by the stomach, which is very little at all of some kinds, is absorbed in the intestine. This throws a heavy load upon these organs and causes us to arrive at the reason why so much that is made out as "Indigestion" by doctors is really intestinal in type.

Bacteria swarm in the lower intestine at all times. By some they are judged as necessary. By others who have made experiments on animals in the arctic regions who have none, they are held as not necessary.

THE LIVER.

The liver plays an important part in the nutrition of the body. It is not concerned to any great extent at all with the movement of the bowels and so cannot be acted upon in that province by cathartics or purgatives. Its function is to secrete the Bile, and to be concerned in the production of urea and in the elaboration of glycogen. It has other functions not well understood among which are the production of bile pigments and substances to aid in coagulation of the blood.

The *bile* has many functions but the most important is the part it takes in the digestion of fats.

A part of it is stored in the Gall Bladder when active call for it is absent. Precipitation of the salts of bile form Gall Stones. It contains two color pigments called *biliverdin* and *bilirubin*. When they are absorbed in the blood by stoppage of the flow of bile or in disease they stain all tissues like a dye and are the direct cause of the yellowish green appearance known as *jaundice*. The liver forms Glycogen, known as animal starch. It is stored in the liver as a reserve fund of carbohydrates.

SPLEEN.

This is the mysterious organ of the body. It is the "undiscovered country" so to speak. Removal of it does not seem to affect the body.

KIDNEY.

The Kidney is a system of little tufts of blood-vessels resembling a rosette on a bonnet. These lie in little balloon-like capsules. The urine drops out, separated from the blood, of the tufts into the capsule and is removed through long snake-like tubes. As it passes through these tubes it is further acted upon and receives other excreted matter. The tubes all run together into a pyramid like point and the urine is collected in the cavity of the kidney (pelvis), where it leaves by way of ureters to the bladder.

Selective cells or epithelium are responsible for separating the waste elements from the blood. The process was originally supposed to be filtration. It is partially so. The more rapidly and strongly the blood comes to the kidney the more it separates the nitrogenous or protein waste, which is mostly secreted here. One of these products is urea. Another is Uric acid. Drugs, bacteria, and the like are also thrown out of the blood by way of the urine.

In albuminuria it would appear that the kidney structure is at fault but a disease like Diabetes has nothing to do with the kidney. The kidney merely removes the sugar as it would a drug from the blood. Whenever these long snake like tubes become clogged with cells or blood they form casts of the tubule like a plaster of Paris cast and when these are washed by the urine out of the body they can be detected easily through microscope.

The sweat also in addition to its effect on the temperature of the body, effect the excretion of waste products.

INTERNAL SECRETIONS.

By this time the reader has become familiar with glands that secrete juices by tubes called ducts into the exterior for various purposes, such as digestion. Glands also secrete substances necessary to life and health directly into the blood and lymph. They are highly necessary to the condition known as feeling "Fit" and in the main, contribute largely to our buoyancy, ambition, and interest in what is about us but it must also be remembered they are just as necessary to life itself. Internal chemical products which induce glands by secretions to activity are known as *hormones*.

The liver has not an internal secretion demonstrated as yet. The *Thyroid Gland*, the over growth of which is termed *Goiter*, is a conspicuous example of an organ which operates very largely by internal secretion. Small glands near the thyroid called *Parathyroids* also have a separate internal secretion. The thyroid excretes a hormone which is practically a form of iodin. In any event iodin is necessary to the activity of the gland. This internal secretion of the thyroid exercises control of nutrition and growth. Various conditions affect it, such as the arrival of puberty especially in girls and the condition of Pregnancy in women. Both of these make a call on the thyroid and if it is not large enough to secrete enough to meet the demand of the body it promptly enlarges. As long as this enlargement is merely a physiological increase, the internal administration of iodine will reduce it. If it is chronic and the frame work of the gland enlarges too, iodine will not reduce it.

THYMUS.

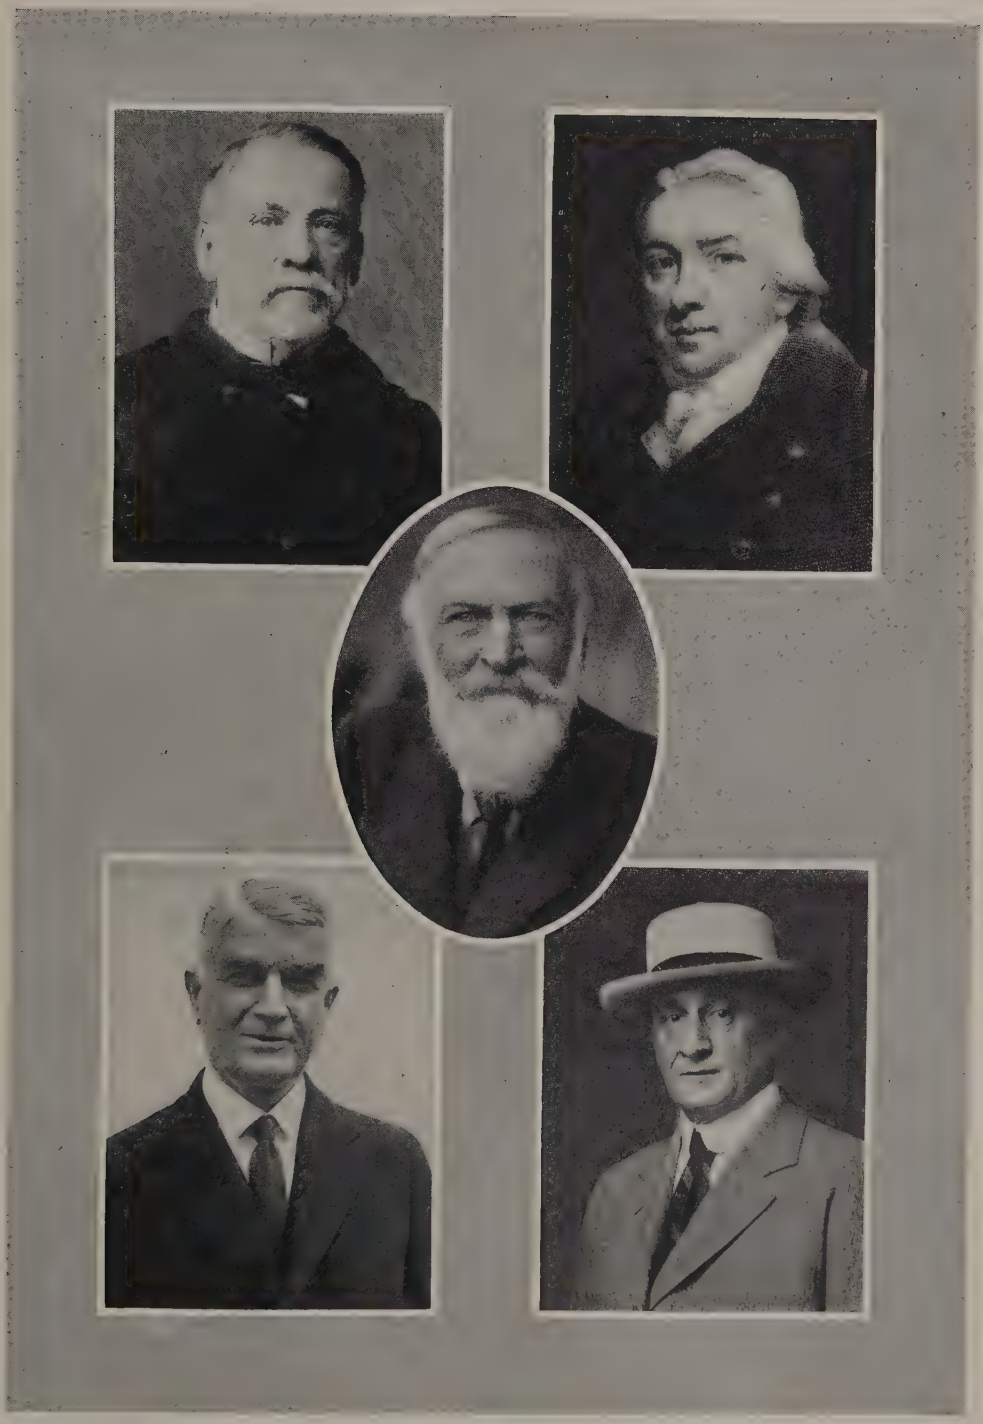
This furnishes an internal secretion perhaps in pre-natal manner and also in the infant which ceases very shortly after birth.

THE ADRENAL BODIES.

Located near and above the kidneys are these ductless glands. They no doubt regulate blood pressure, but it is probable they also have an effect in regulating spasmodic conditions of the inhibitory apparatus.

PITUITARY BODY.

Located in the Brain. Consists of two parts a forward or anterior part or lobe. A backward or posterior part or lobe.



Photos 1, 2, 4 copyright by Keystone View Co.; 3 and 5 copyright by Underwood & Underwood.

Dr. Howard Atwood Kelly

The anterior lobe has an effect on growth of the body.

The posterior lobe secretion raises blood pressure and stimulates possibly all involuntary muscles in the body. It is the secretion of this part of the Pituitary Body that is used to induce labor pains in the pregnant woman. This it does promptly when injected. Care must always be taken that the outlet is large enough to admit passage outward of the child as rupture of the uterus may result. It is also used to contract the uterus and stop bleeding after the child is delivered. This secretion is also used in surgery to act on dilated intestines to produce a contraction of their muscles and expel gas during the period after operation.

The anterior lobe has to do with growth, giants and dwarfs are the result of the unnatural functioning of the organ. Obesity especially about the hips is regarded as due to an abnormality of this gland.

ORGANS OF REPRODUCTION.

Owing to the general prevalence of interest in the internal secretions of these organs they have become a matter of popular importance. The testicles have two secretions. The one the *spermatozoa*, is directly concerned in fructification and the reproduction of life. Passing out by the way of the genital organs of the male it fertilizes the female egg or ovum.

The other is an internal secretion passing from gland into blood. It produces the characteristics of vitality and sexual appetite in men and except in this indirect manner has nothing to do with reproduction. Therefore implanting a testicle under the skin of a man will in no way beget children at all except that the procedure awakens activity in his own glands to secrete virle spermatozoa. But it may produce quite a number of changes which may be regarded as increasing his general well being. In many cases these are not permanent and cease as the implanted organ atrophies or dries up. The students and observers of this procedure have not the confidence in it that the popular mind has painted. Animals in which testicles are removed become femininized.

The ovaries have an internal secretion but its influence has not been made out. Women who have had them removed may gain in weight, at times suffer with hot flashes and headaches but no other changes have been noticed. While some women have an altered sexual appetite, the majority seem to suffer no changes.

PANCREAS.

It has been pointed out that the Pancreas secretes a digestive juice. There are however in this gland a number of spots called the islands of *Langerhans*. They secrete a substance that has nothing to do with the direct digestion of food. Its duty seems to be to act as a coupling so to speak between the cells of the body that need sugar and the sugar itself. Loss of these spots or islands produce *diabetes*. The more islands lost, the more severe the *diabetes*. Like two Pullman cars ready to move that have no coupling, so is the cell ready to absorb the sugar and the sugar in the blood ready to be absorbed by the cell. The result is that sugar accumulates in the blood and is removed when in excess by the kidney. As stated before *diabetes* is a disease of the blood not of the kidney. Insulin, the newly discovered product is an artificially prepared secretion obtained from the pancreas of animals. It is this coupling which on being injected into a diabetic immediately affords a union of cell and sugar. Its danger is in giving more coupling than is needed. The immediate swallowing of sugar or orange juice will correct this. Tests for blood sugar mean taking some blood and determining the percentage of excess sugar in it.

NUTRITION. HEAT.

Proteins or Proteid Food supply some energy, but their main use is to build up tissues of body.

Carbohydrates furnish the energy of the body —the coal in the furnace to furnish power.

Fats furnish the coal in the furnace so to speak for heat.

Vitamines furnish some peculiar power to build up the body. As they have not been isolated and their existence is mainly shown by the desperate conditions that arise when they are absent, it is difficult to give a description. They are designated by the letters A—B—C. found in Cod Liver Oil, Vegetables, Milk, Butter and Yeast.

They are absolutely necessary to a growing baby and are supplied to it by way of fruit juice, tomato juice and the water from spinach.

As most every organ of the body is largely composed of water and every process is concerned with water it is at once apparent water is an absolute necessity. Likewise the minerals and mineral salts. Iron in the blood, iodin for growth, carbonates of soda and potash, in the chemistry of the blood, common salt for the production of chloride, as well as lime for the bones and teeth make an ash free diet that is full of danger and death.

Flavors and condiments act favorably by making the food appetizing. In moderate amounts they increase the flow of gastric juice.

Coffee and tea in moderate amounts are stimulant to muscular energy. They are perhaps harmless unless taken by those who have a so called idiocyncrasy for them. Alcohol possesses some value as a food and to supply energy but as a stimulant in practically all cases coffee is superior. Alcohol has a poor after effect.

HEAT AND ITS REGULATIONS.

1. Heat is lost through excreta.
2. Expired air.
3. By sweat.
4. By conduction directly away from skin.

Heat is produced.

1. By oxidation of food.
2. By exercise.

Heat is supposed to be regulated by a heat center in the brain and it is the interference of this center by organism and through secretions of a toxic nature that gives us fever in disease. This is done in pretty much the same way a carburetor in an automobile when tampered with and its regulation thrown out of the normal

gives you either too lean or too rich a mixture. So the toxic products of disease interfere with the heat carburetor so to speak and give us either a subnormal or a fever temperature.

REPRODUCTION.

This is a difficult subject to comprehend and concerns the union of the ovum or female egg and the spermatezoa—a small unit resembling the common tadpole though microscopic in size. This union is called fertilization and one of its fundamental problems is heredity.

The ovary is a small organ lying on the right and left side of the uterus. It has no direct connection with the uterus. The uterus has two arms or tubes in the form of the arms of a bat and on the end of these tubes is a stringed ending resembling the vegetable kale. Each month a so called Graafian Follicle passes up to the surface of the ovary. It contains the egg or ovum, a miniature explosion takes place and the egg projected passes down through the open end of the tube into the uterus.

Menstruation while not fully understood is thought to be a preparation, by casting off the inside covering of the uterus like a snake does its skin, for the fertilization of the egg.

If the egg meets the spermatezoa in the uterus or the tube then fertilization takes place.

This maturation is a complex process and resembles the various figures proceeded by that form of fireworks known as the pin wheel.

After various steps in a period of 280 days the reproduction is complete. Hormones forming in the blood of the mother cause the breast to function and other changes. If these hormones are improperly formed the toxic conditions of pregnancy eclampsia and the other kidney poisonings occur.

HEREDITY.

This embraces the idea that in fertilization we have two cells uniting in one cell and thereby building up many more and also that these cells build up with many characteristics of the two that caused them, in an orderly manner. There is in this connection a law formulated by Mendel. It supposes that characteristics are handed down in blocks or units. Substances in the parent cells called unit factors are supposed to make them. In most cases there is no blending but the child takes on whatever is dominant in either parent. The equivalent characteristic is supposed to be there hidden away so to speak and is called recessive.

Heredity does not altogether shape the course of the individual, environment may change the life, at the same time it is profoundly possible by the Science of Eugenics to breed the better class of characteristics.

ENVIRONMENT.

Those influences which surround us in all phases of life and control in a large sense, the acts, desires and impulses of the average individual. Modern Science gives more stress to this by far than it does to heredity. It is true that some of the world's most famous men have had the worst kind of environment and maybe a rather undesirable heredity history and yet through it all mounted to fame.

Some of our greatest artists and composers have written and scored the world's greatest masterpieces while ill with Tuberculosis or other maladies equally as devastating to the human body. These however are exceptions to the general rule and only bring out in greater relief that the "average person class" to which we most all belong must have a good environment. The better the environment, in all probability the better the citizen will be. If you have good books around, the child will naturally accept good books as a part of a regular scheme of life. If you have a reference book around handy and go to it yourself whenever you find or hear of a subject you do not know about, then the child by imitation will take this up as a natural movement of its environment and go and do likewise. It therefore behooves us to have such books easy to obtain and consult.

"Early instruction in truth will best keep out error. Some one has well said, 'Fill the bushel with wheat, and you may defy the devil to fill it with tares.' "—*Tyron Edwards.*

As we find it in the case of books we find it in the matter of health. If the environment of a child includes parents or guardians naturally alert to teach it little by little the facts of health and disease it will be far easier for such a child to keep itself fit than one who has to learn it all off "by heart" (as they say in school), from text books in a few weeks. Information taken little by little each day as it is usually done without effort remains fixed in the mind and is not forgotten. Neither does it seem anything like the task it is often made to appear when it is all imparted and received in a few weeks.

One may be said to grow up in an environment of hygiene where the child receives little bits of advice on diet, health and right living from day to day. It comes to him naturally as the bird or kitten learns little by little from its mother, the various movements it will be later called upon to use. Instinct does a lot for a fledgeling or a kitten, but so also do its parents.

Tuberculosis is no longer regarded as a serious disease from Mother to child except she naturally gives her off-spring a weakened constitution. But if after the child is born she constantly expectorates around the home she is simply placing her child in an environment fraught with millions of bacteria which inhaled into its weakened constitution give it the disease. Environment not heredity gave it the disease.

We think at this time in the same terms about Cancer. It is not hereditary but acquired. So then it behooves us all to have cheerful homes, good reading matter, exhilarating amusement that shall be free from stimulation or taint, plenty of sleep, relaxation, periods for reflection, good food picked out with excellent judgment with a common sense regard for not having too much of any one kind, abundance of water, if possible congenial work, friends for social intercourse, and in the case of children parents who are ever on the alert to detect early signs of decay or deformity, or infection. Had we all these then could we say we had an ideal environment.

HYGIENE.

What has been said earlier about care of the body, when it is well, to avoid possible mild ailments leading on to more serious defects applies to the school children. Often times parents object to the ministrations of school nurses. Possibly there are some over zealous, but in the main the whole theory on which school nursing is based, is that by frequent examinations and observance the little things at their beginning can be detected and thus the later serious defects prevented or arrested. For instance calling your attention to a bad tooth or infected tonsil easily curable may prevent development of a "leaking heart" incurable.

Height and weight are of great value in ascertaining the nutrition and growth. But it must not be forgotten that there are exceptions to this rule as you may notice in a tall girl who is very active and yet may be normally thin. However for the most part they are good guides.

TABLE INSPECTION.

Observe your child at home and tell him or her to report to school nurse anything you notice out of usual. Or else consult your physician. For many diseases begin with poor color, sallow skin, constipation, diseased teeth, child sleeping with mouth open, snoring, dislike of exercise, dry brittle hair. The chronic diseases like Tuberculosis, Kidney disease and the like seldom if ever begin with pronounced symptoms. See that your child gets a well balanced ration. This does not require any unusual effort. Proteins, carbohydrates, fat, water and mineral salts must all be present as each one does something in the upbuilding. No wonder then that a child who wants almost all his diet to be sweets or starches languishes and has to be given cod liver oil. Fruits are absolutely required. Fats in proper amount as well. The proteins come in meat, cereal, milk, and eggs. Plenty of water in some form or other. Most children actually like good water. Exercise without excessive play. Do not forget oxygen is a food too, so fresh air always. Ten to twelve hours sleep. Comfortable clothing, a good bath frequently, and he must have some recreation he likes.

EYES.

It is better to take your child to a good oculist now and then. It is true there are men who may give glasses when not needed but that dishonesty will happen to be the case in any walk of life. The great majority of good oculists charge what sometimes appears a rather high stipend but it is tedious work of a high order and almost anyone of them are just as glad to give you a negative as a positive answer. Select a good oculist and abide by his decision. Do not allow any little eye defect to go unnoticed. Itching eye lids, constant redness of lids, "Blood shot" eyes; occasional crossing, failure to see plainly, headaches on reading, holding book close, twitching nerves, frowning,—all call for examination. Don't take the advice of neighbors. Go to an oculist. If he says "Glasses," get them. Use them.

TONSILS AND ADENOIDS.

Whatever children were in other days, makes little difference in the fact that a very large number have these organs diseased today. The chances are they were not noticed and the "brain fever" and other unnamed diseases were the after effect of disease from these organs. You often hear that too many are removed. Mistakes are made but not very often in proportion to the great number affected.

Put your finger on the nostril of a child. Stop the breathing in that side. Does he breathe through the other? Does he snore or is he a mouth breather? Is his face pinched and drawn? Is he drowsy? In some cases slow to learn? Does he have running of the nose? Earache? (Remember a little tube passes from back of the tonsil up to the middle ear). Does he talk through his nose? If he has these look out for adenoids. These are little growths in a part of the nose and throat you can't see. He might just as well have two or three little balls of cotton or gauze there as far as obstruction goes. Not only that, their being infected spreads it elsewhere and makes it easy to "catch" other diseases. By a peculiarly shaped little instrument they can be quickly scraped off. They may come back. It does not matter. They must then be removed a second time. See a competent adviser.

THE TONSILS.

It is unfortunate but nevertheless a fact that although you can see the *tonsils* you cannot make sure they are diseased. For many a tonsil is diseased at the bottom or underneath, while the top appears normal. If you could go in an operating room where they are removed you would see this statement verified many many times. Many diseases of an inflammatory nature can receive their start from what is lurking in the bottom of tonsils that you cannot see. Acute *Rheumatic Fever*, growing pains, valvular leakage of heart, earache and middle ear disease, neuritis, nephritis (Kidney disease), many troubles with digestive canal, St. Vitus Dance, decay of teeth, have their origin in an infection of tonsils slowly and stealthily planted in various remote regions by the blood current. A tonsil is full of little long pockets like a bee hive. Honey can be at the bottom or top of a comb and likewise so can infection in the tonsil. All forms of disease germs can find a comfortable home in these crypts. Then on occasion flare up and seek other locations in the body. While removal of the tonsil necessarily is attended by some bleeding it soon stops as does that following extraction of teeth. Consult a competent physician and always be sure your child has a "coagulation test" to see how his blood clots before the operation is done.

TEETH.

Your grandfather may say "teeth" were not bad when he was a boy. It may have been so then, it is not now, and we live in today and tomorrow. Do not wait for toothache to appear as a warning. Pain often warns us too late in

many conditions of the body. Look for discolorations. Look at crooked, irregular teeth and then decide that you will have teeth constantly inspected while they are evidently good. Each tooth is worth hundreds of dollars to any boy or girl. The X-Ray is a big help.

"Focal Infection" is a prominent factor in the cause of disease as seen today. It has been found that there are not so many different diseases as we thought but it is more likely that germs located in foci or spots in tonsils, teeth and adenoids are carried in the blood current (like salts of minerals are carried by brooks and streams and deposited on stones) and lodging in various organs "Hatch out" by the millions in these new locations and set up a new inflammation. Your child has a "Mastoid" which is acute inflammation in little closed bony cells back of the ear. You say what Disease is that? It is not a new disease. Germs from some infected teeth were washed there by the blood. Found a haven started the usual process of inflammation. Operation is required to get them out. Likewise your child develops inflammation of the kidney. Where did he get it? Perhaps from an infected tooth or tonsil. But you say his mouth appeared all right to you. Perhaps so. It may take an X-Ray to show the abscess in the tooth. Even such a disease as *Biliousness* may have its origin in an infected tonsil. There are two small sinuses or caverns in the head connected with the nose or ear by a small canal admitting a very small wire. There are some in the bones of the forehead, another set back of the bridge of the nose, and some in cheek bone. These too may become infected and be focal areas. Chronic Diseases of these or of tonsils or teeth are serious. So have your child inspected now and then, "for a stitch in time saves nine."

HEARING.

Nearly all of the ear troubles start from the mouth up through the eustachian canal into the middle ear. Some come by the blood current. Frequent examination alone will prevent them but after they have done permanent damage it is exceedingly hard to bring back the hearing. Avoid indiscriminate washing of ears with various washes, the composition of which you do not know. Ear troubles are best prevented by drugs dropped into the nose.

DEFORMITIES.

Orthopedics—the science of correcting deformities has disclosed many of them. Watch early for deficient motion in limbs. Keep your children's feet in shoes that are not tight. Throw shoes away if they hurt. If any deformity appears seek the best man in your vicinity who follows the specialty.

NERVOUSNESS.

Do not say that this is merely tempermental until you are sure of it. Children should not be nervous. This does not mean that "gritting their teeth" means worms, or crying out in the night tends to epilepsy. Neither of these are true. But if child "wets the bed" at night, jerks his head or eyes, or has ever so slight a condition known as "fits" consult a competent adviser. Whether the cause is the "movies" or lack of sleep, it is nevertheless a fact that nervousness in children is on the increase.

TUBERCULOSIS.

Children should not be exposed in the same household to a tubercular patient. Nor should they drink milk from cows not tested against tuberculosis. These are the two common causes of the disease.

Probably one third of all children have a slight attack of this disease sometimes in their lives. Children who have had other chest diseases are especially prone to it.

Underweight, lack of desire to go and play, "kernels" in the neck, fever (very low), night sweats, condition known as "scrofula" or "debility"—these are all early symptoms. It is sometimes thought that much of the tuberculosis in grown ups is only a return of tuberculosis they had when a child.

Rest. Fresh air. Good plain every day food. Sunlight. These are the treatment in the beginning. Later, exercise selected and moderate.

CONTAGIOUS DISEASES.

Most diseases are caused by direct contact, although some may be air borne. Many people have germs in their bodies which have become harmless to them but are still dangerous to other people. They are called "Carriers." Germs need moisture and warmth and tissues like the human body. Unless one has the resistance against them they will enter and start to grow and live wherever they can.

MEASLES.

A very dangerous disease and very much under rated. You know how severe it appears from the outside, then recall it is appearing similar to that in the respiratory tract, namely the wind pipe and lungs. Pneumonia is what is to be feared. Running eyes and nose, a nutmeg grater cough, dry skin, and at times little blush white spots along teeth and on gums, *Koplik's Spots*, are the earliest signs. Your child is most dangerous to others during this time. Measles leaves the child in rather impaired condition—a fruitful soil for other diseases. Middle ear disease is quite common.

WHOOPING COUGH.

Whooping cough carries a fatal termination in many more cases than it is generally supposed. Nor is it the heart so often that suffers as it is the weakened condition generally speaking that follows. The whoop is due to the action of the diaphragm. It is not absolutely necessary as a symptom. If child grasps chair and coughs at the same time and vomits long ropy mucus, holding its breath and has been exposed, suspect it whether he whoops or not.

SCARLET FEVER.

Probably in its severe form the most dreaded disease of modern times. Yet it can occur in so mild a form as scarcely to be noticed. It is infectious in either case and very much so in its beginning, not so much its scaling stage. All

of these diseases with rash and cough that belong peculiarly to children begin with headache, tired feeling, aching of bones, some fever and intestinal disturbance. Eating food that does not agree with your particular digestive system, paw paw, peanuts, cabbage, etc., may give you a short term red rash. They do not have sore throats. All discharges from every where should be regarded as catching, or should be destroyed.

Doctors suspect, although they do not know for sure, that the germ that causes this, causes blood poison, therefore it leaves all the organs especially the kidneys and middle ear in poor condition. Both should be closely watched. Through the discovery by two investigators, the Dicks, has come a Dick test and the serum. The one enables you to tell whether you are susceptible or not, while the serum bids fair to eliminate scarlet fever as diphtheria has been. Do not conflict this *Dick Test* for scarlet fever with the *Schick Test* for diphtheria. They are entirely separate.

DIPHTHERIA.

Formerly a very fatal disease, while now if intelligently handled, is very mild. Intelligently handled means getting an early diagnosis as well as an early injection of antitoxin into the patient. Delay is the worst condition in this malady. The fatalities used to be 35 percent, now they are hardly one percent. Suspect every sore throat. It is the only way. Nor can you tell by looking at it alone. Some cases of ordinary tonsilitis appear worse than mild diphtheria. In general, diphtheria looks like a grayish white smear of velvety looking paint. The membranes stick tight. If in least doubt obtain physician or a nurse who will make a culture. This is not in the least harmful. It merely means obtaining some of the discharge and membrane and examining it under the microscope and also letting it hatch out like eggs in an incubator. The Schick Test is a test which shows whether a child is susceptible to the disease. There is an antitoxin which protects against the disease, and this antitoxin coupled with the antitoxin the patient developed himself overwhelms the poison. Horses in prime condition if given the disease throw it off, and just at the point where their system is getting the ascendency, their blood is taken. The horses do not suffer, they usually survive. The clear part of the blood is then strained off, and is rendered free from any tendency to spoil. The patient is doing this when he has diphtheria, only it comes on so gradually that he cannot manufacture his own fast enough. So doctors give the horses serum to the patient and together they cure the patient. Some times people break out in hives after the use of the horses serum. This comes from mixing two kinds of blood together, and soon wears off. Gargles help to keep the mouth clean, but when the membranes get in the throat the wind pipe will have to be opened or a tube by way of mouth inserted. If you have an early diagnosis, plenty of antitoxin, these severe measures never will be necessary.

GERMAN MEASLES.

A mild disease with a short term rash like measles.

MUMPS.

Mumps, no rash but a swelling down on face in front of ears. Keep patient quiet, give ordinary nursing care. In boys watch for complications of the testicles.

SMALL POX.

An obsolete disease which has been made so by vaccination. The unpleasant features of vaccination scabs are very often mixed infections due to germs of the pus family getting in. Every child should be successfully vaccinated.

TYPHOID.

Caused by a peculiar germ found in water and milk. Can be prevented by having three injections of a vaccination serum. If in doubt about its nearness boil all water and even the milk if necessary. Have your water supply examined.

INFLUENZA.

A disease resembling measles but with no rash. It is likewise really a form of pneumonia, of the broncho pneumonia type. Prostration is an early sign. It comes into the body by the way of the nose and throat.

PNEUMONIA.

The king of diseases comes in by way of nose and throat. Give attention to them and keep the body as near fit as possible, avoid exposure, especially for long periods, with insufficient clothing protection and little food. Pneumonia is catching; be sure to have enough fresh air and avoid close, ill ventilated places where many people congregate. This disease depends on one's so called existence as to its outcome.

INFANTILE PARALYSIS.

Comes into the body by way of nose and throat.

When one case has been made out, all other children should be protected. It is a highly contagious disease. If you have a child that has had it consult the best crippled children expert you can find to obtain proper correction. Consult him before deformities appear.

HOOK WORM.

Found in southern climates. Very great pallor lazy disposition. Backwardness at school and distention of abdomen. The worm or egg can be found in stools. Sanitation is needed while the drug thymol is an antidote.

HAY FEVER.

We have a proteid balance in our body. Some people have this easily disturbed by eating or in handling even minute quantities they are sensitive to. Some people can not eat eggs. The dandruff of a dog upsets others; but by far the most offensive is the pollen of plants such as rag weed, timothy, rose pollen, all can cause it as can many others. Injections of protective extract can be made into the body if you know which one is the offensive. Hay fever is caused by these various irritating substances from these plants and foods.

LOCK JAW TETANUS.

Found in dirt, dust, fire crackers, blank cartridge wads, manure, hair, etc. It gets into the body through a wound. It thrives best if wound seals itself because it cannot grow in the presence of fresh air. The symptoms do not appear until later, so a wound produced by an old dirt covered nail or from the above mentioned causes should be well opened, thoroughly cleaned and at the time of injury a protective dose of antitoxin given. Do not wait for the spasm of the muscles to develop; it is then often too late. Remember it is not the rust of an old nail, it is the germ hidden in the rust away from the air that does the damage. Call a physician at once.

TRACHOMA.

Very infectious disease of the eyelids; granular lids that persist must always be looked at by competent eye physician.

PEDICULOSIS. LICE.

Well recognized as little white nit on hair: comb with fine comb, apply kerosene or larkspur after thoroughly shampooing; leave on over night.

SCABIES ITCH.

Anybody who has red, irritated areas with little marks like a fine needle scratch, face, arms, fingers or abdomen which suddenly appear should consider scabies, especially, if one after another develop it. Sulphur ointment is a cure. Disinfect all articles of bedding and clothing.

IMPETIGO.

Large clusters of thick crust with reddened base, exuding water-like discharge, contagious. Use sulphur, zinc, or amoniated mercury ointment, the last must be handled carefully.

RING WORM.

If inflammation of the skin occurs in circles, consult a doctor.

HEAD COLDS.

Only a word to say they must not be neglected or left to run their course unmolested.

RICKETS.

A disease caused by lack of sunshine and a diet lacking in mineral and vitamines. Sunshine, a balanced diet cure it. The bones are soft and easily curved and bend under weight.

SCURVEY.

Child pale, skin not clear. Later red spots and bleeding gums, caused by faulty diet. Lacking in fruits and vegetables.

PELLAGRA.

Brown, dirty looking splotches on the face, neck and knees. It is a nutritional disease and needs a balanced diet.

GOITRE.

Enlargement of the thyroid gland of the neck coming on about puberty, although may exist before. Iodine administered in chocolate tablets or otherwise is its cure. This is now usually given in the school and no parent should object to its intelligent use. Iodine like iron is needed in your system. Iodine given thus, is not a drug, it is a necessary constituent of the body. Cod liver oil also contains iodine.

ACCIDENTS.

Almost all articles or objects we come in contact with are covered with germs. Any laboratory can demonstrate this at any time. Most of them do no damage to the unbroken skin. Unfortunately there is no way of telling where the really dangerous ones are located. A thousand common pins may have nothing on them of a dangerous character but the one next to it may have on its point the streptoccus, the fatal germ of blood poison. These germs are as different as varieties of snakes and under the miscroscope are as different as a rattlesnake is from a garter snake. The only thing you can do is to promptly take care of all wounds however trivial. Turpentine or peroxide of hydrogen will not do this. Use iodine, also solutions of bichloride of mercury, lysol, creolin and *Dakin* solution. In the eye and ear some of the silver salts or boric acid may be used if proper directions have been given. "Drawing" with fat meat, application of dirty cobwebs or tobacco are of no value and carry germs.

HYGIENE.

II

The definition of Hygiene is the science of health and its preservation.

Periodic Health Examinations should be made if one expects to ward off many of the ills of life. It should be done like the teeth are examined or one's automobile is gone over. Nor is it necessary to have some big organization do it, there are in nearly all sections of the country medical men who are capable of doing this. All that is required is that they be trained as well as honest. This advice applies to babies as well. The average loss to each person in loss of time each year is seven days. Over two percent of American wage earners are constantly ill. In the war over half the recruits had defects which caused some trouble. A stitch in time saves nine.

INFANT HYGIENE.

A baby should be registered not only for vital statistics but as a matter of lawful record. A new baby should have silver in some form put in its eyes at birth to prevent blindness. Mothers milk is of course best for the baby. Nature no doubt has the better idea of just what it requires. No doubt properties the mother possesses are passed on to the baby to fight off disease. Not nearly so many breast fed babies die as bottle fed. Beside if the nipple is cleansed the milk is certainly clean. If the mother has a communicable disease such as tuberculosis then it should not be fed by her from breasts.

Mothers milk may not be in sufficient quantity. Drinking more water by mother and massaging the breast may help. The baby's sucking them stimulates them as well. The baby should be nursed at regular intervals. Some

prefer 3 hours, others 4. Whatever is decided on should be strictly adhered to. Arousing the baby up when asleep can do no harm. It immediately falls asleep again. One feeding at night from one to two A. M.

Three hours or over is selected because it takes that long to empty a baby's stomach. A baby should be breast fed up to ten to twelve months. If persisted in too long, the baby obtains milk similar to the so-called "strippings" from a cow. Orange or lemon juice or tomato or spinach water should be given in order to insure the so-called vitamine element. Up to four months one teaspoonful strained with water is given daily.

WEANING.

It should be partially attempted as early as six to 10 months. Baby trained to use bottle or cup. There can be no set rules of feeding for any baby. They all require attention in special ways. The following is taken from a Health Bulletin.

6:00 A. M. Breast feeding.
9:00 A. M. Orange juice—two teaspoonsful.
10:00 A. M. Well cooked cereal, breast feeding.
2:00 P. M. Breast feeding.
6:00 P. M. Well cooked cereal, breast feeding.
10:00 P. M. Breast feeding.

At seven months:

6:00 A. M. Breast feeding.
9:00 A. M. Orange juice—two tablespoonsful.
10:00 A. M. Well cooked cereal, breast feeding.
2:00 P. M. Vegetable soup, hard toast or zwieback, breast feeding.
6.00 P. M. Well cooked cereal, breast feeding.
10:00 P. M. Breast feeding.

At eight months:

6:00 A. M. Breast feeding.
10:00 A. M. Orange juice or raw cabbage juice, cereal, toast or zwieback, breast feeding.
2:00 P. M. Vegetables (one tablespoon), toast, broth, breast feeding.
6:00 P. M. Cereal, toast, breast feeding.
10:00 P. M. Breast feeding.

At nine months:

6:00 A. M. Breast feeding.
10:00 A. M. Orange juice, cereal, two ounces milk (boiled one minute), toast, butter, breast feeding.
2:00 P. M. Broth, fresh vegetables (two tablespoons), baked potato, butter, fruit, zwieback or cracker.
6–6:30 P. M. Cereal, two ounces milk, (boiled one minute), breast feeding.

If the baby cannot have breast milk then cow's milk modified must be used. Cow's milk and mother's milk are not the same. Modification means bringing cow's as near as possible to mother's milk.

Pasturized milk means milk that has been brought to a certain heating point considerably short of the boiling point, but enough to kill or greatly inhibit the growth of bacteria. Many diseases a child is later heir to as well as the cause of its many ailments during infancy are due to germs of bacteria in milk. It is the duty of parents to spend some time and care in finding out the character and source of their infant's milk.

Numerous preparations of artificial milk are to be had. Some of these contain too much sugar. Some of them are merely milk with the water extracted and come as a powder or in condensed form. Many of them are merely added to milk as modifiers. There are times when they are very excellent additions or even substitutes but they should be selected by a physician to suit the needs of a baby. Corn syrup is at times admissable. All of them should be prescribed and not used blindly depending on advertisements. Everything entering into the procedure of feeding a baby must be clean.

A baby's bowels should move at least once or twice a day. Water given regularly will aid this. If some evidence of clogging up arises, a syringe (baby) of warm water as an enema will probably be sufficient. This should not be required often. A safe and sane laxative in the drug line has as yet not been found that could be given indiscriminately.

Soft material in dressing baby. An abdominal band is not required after second week. It frequently causes crying because it is on too tight (after feeding).

A baby should gain over half an ounce a day in first six months. After this a little less. It is interesting and helpful to weigh it daily At the same time it is no cause for worry if at times it fails to do this every day.

A baby needs its full share of oxygen. Growing it needs a good deal. It should get it. This does not mean to put it where it can kick the covers off and be in a direct draft. Drafts cause the rapid conduction of heat away from body like blowing on hot soup cools it. The modern theory of sunlight makes it an absolute necessity. Rickets, one of the worst of children's diseases is prevented as well as cured by sunlight. Babies properly protected should go out in cold weather. Babies out of doors or on porches in all kinds of weather naturally develop a hardiness.

A baby's greatest requirement besides food is sleep. This should be regular and free from interruption. This should be 18 to 20 hours in first six months. A little less after that.

A baby should lie flat, and if it is properly fed the use of pacifiers and the like are not necessary. Insects not only interrupt regular sleep but carry disease. Colic is either caused when the baby is really hungry or else by overfeeding. Overfeeding is usually the result of irregular feeding.

Summer is not any more dangerous than any other time if the baby is fed reliable milk and its usual habits observed. The fact that summer is the time of vacations and parents usually travel around, makes the above a little difficult to observe. Nevertheless they should be if your baby is ill or is not gaining weight you should consult a competent adviser at once.

VITAL INFORMATION CONCERNING THE PREVENTION

DIVISION OF COMMUNICABLE DISEASES

DISEASES	EARLY SIGNS AND SYMPTOMS	SOURCE OF INFECTION	INCUBATION PERIODS	MODE OF TRANSMISSION	PERIODS OF COMMUNICABILITY
Cerebro Spinal Meningitis	Rapid onset, headache, stiffness of neck, and vomiting. Temperature 102°. Positive Kernig, Herpes Labiales.	Naso-pharyngeal discharges.	2 to 10 days	Contact, droplet infection from sneezing or coughing of carriers or cases.	So long as meningococcus persist in naso-pharynx—carriers more common than supposed.
Chickenpox	Usually occurs in children under 12 years of age. Onset usually gradual with mild fever The symptoms may be mild or lacking. The rash appears on the second day as small raised pimples which shortly become filled with clear fluid.	Discharge from skin and mucous membrane.	14 to 21 days	Contact with patients or articles soiled by discharges from lesions.	While primary scabs are present on mucous membranes and skin. Discharge from nose and throat. Most infection during early stage of disease.
Diphtheria	The onset may be gradual or rapid. The early signs are those of croupy cough, fever and sore throat with grayish-white patches on the throat, palate or tonsils. The glands of the neck near the angle of the jaw may be swollen. Later there may be profound prostration.	Discharges from throat, nose, vagina, and wound surfaces—persistent carriers often show virulent bacilli in tonsilar crypts.	2 to 5 days	Contact with discharges from cases or carriers—milk and milk products are vehicles of infection.	While virulent organisms are present in secretions and lesions. Well persons carry diseases for months.
German Measles	While the onset is sudden the malady is usually mild. The rash may be the first sign noticed. Ordinarily there is no "cold in the head" as there is in measles,	Oral and nasal discharges.	10 to 21 days	Direct contact with patient or with fresh oral and nasal secretion.	Eight days from onset, and especially during catarrhal stage.
Influenza	The onset is abrupt with fever, chills, pain in the head, back and limbs as well as a "cold in the head." Lassitude or profound depression are characteristic symptoms.	Oral and nasal discharges.	2 to 5 days	Direct contact with fresh discharges. Droplet infection—sneezing and coughing, improper sterilization of Mess gear, common drinking cups, towels, etc.	Unknown. Probably until four days after temperature is normal.
Measles	Begins like a "cold in the head," with running nose, watery, inflamed eyes and sneezing The rash, consisting of small, irreguiar groups of dull-red, slightly raised spots appears about the third day.	Oral and nasal discharges.	7 to 18 days Usually 14 days	Direct contact with fresh discharges of persons coming down with disease.	During period of catarrhal symptoms and while there are abnormal mucous membrane secretions.
Mumps	The onset may be sudden or gradual with slight fever, nausea, pain and swelling about the angle of the jaw.	Secretions from mouth and possibly nose.	4 to 25 days Usually 18 days	Direct contact with cases or articles freshly soiled with secretions of mouth.	From onset and one week after disappearance of swelling.
Scarlet Fever	The onset is usually sudden. Vomiting, sore throat, headache or fever may be early symptoms. In the beginning of the disease the eyes are not watery or congested as in measles. The rash usually appears within 24 hours upon the neck and upper part of the chest. It appears as fine bright-red and evenly diffused spots. Later the skin peels in scales, flakes or large pieces. In the early stages of the disease the tongue is often of a characteristic strawberry type, the red papilae of the tongue showing through the white fur.	Discharges from nose, throat, ears, and broken down glands and any open lesion.	2 to 7 days Usually 3 or 4 days	Direct contact with cases or articles soiled by infectious discharges or by contaminated milk.	Twenty-eight days from onset, without regard to desquamation and while there are abnormal discharges or open sores.
Whooping Cough	The disease is highly infectious and sometimes assumes a virulent type. A malady that is particularly infectious during the first few weeks and is accompanied by a high mortality among very young children.	Discharges from bronchial and laryngeal mucous membranes.	Within 14 days	Direct contact and with articles freshly soiled by discharges.	During catarrhal stages.

SCABIES OR ITCH

An infectious eruption found most frequently on palm of hand and between fingers. The usual treatment is to wash affected parts thoroughly with warm water and soap and then anoint with a diluted sulphur ointment. Child should be kept separate until cured. Sleep alone. All clothing and bed linen should be boiled for one-half hour. Quite contagious, especially to others in same family. Exclude child until eruption has entirely disappeared.

PEDICULOSIS OR HEAD LICE

Light gray insects. Lay eggs or "nits" in the hair at the nape of the neck and about the ears. Symptoms are irritation and itching of the scalp. The usual treatment is to soak hair in kerosene or in turpentine, wash thoroughly with soap and hot water. Repeat three successive nights. Scrupulous care and cleanliness are sufficient to prevent recurrence. Exclude child until head is free from lice. Entire family must be deloused.

AND CONTROL OF COMMUNICABLE DISEASES

WEST VIRGINIA STATE DEPARTMENT OF HEALTH

Laboratory Diagnosis	Rules for School Attendance	Special Features	Period of Quarantine and Method of Control
Examine cultures from pharynx of carriers or spinal fluid turbid and under pressure organisms can be found intra and extracellular.	Children from houses infected shall be excluded from school during the quarantine period or may be permitted to attend school after being removed from infected house and kept under observation for 10 days together with obtaining negative pharyngeal cultures.	Most prevalent in winter and spring months. Over-crowding is a factor in the spread of the disease.	Quarantine and isolate for 14 days—isolate carriers until pharyngeal cultures negative 2 to 4 times. Prevent overcrowding and deficient ventilation.
Chief inoculation (Lymph) rabbit's cornea negative for Guarnieri's bodies as against variola.	Sick child can not attend school. Exclude contacts to known cases from school for period of 14 days unless satisfactory proof of their having had the disease is furnished.	A mild disease with few after-effects but readily transmitted. The most dangerous period is during the onset of the disease. Papules, vesicles, postules and crust present at same time due to successive crops of the eruption.	Notify health authorities having jurisdiction and isolate patient for 14 days from beginning of the disease, and until all abnormal discharges have ceased.
Cultures throat, nose or other affected surfaces. Examine for B. Diphtheria.	Sick child must be excluded from school until two negative cultures, taken not less than 24 hours apart, are obtained from the nose and throat. Children remaining in infected home may be released 5 days after quarantine is lifted, 1 negative culture and freedom from disease. Exposed children living in other homes may be released after 1 negative culture and freedom from disease. Children exposed to disease should be removed from infected premises and kept under observation for a period of 5 days. At end of this period secure 1 negative culture before releasing.	A very serious disease, varying greatly in its forms and frequently escaping detection. Mild cases should be particularly sought after as they are fully as infectious as the more apparent ones. All children under 5 years of age should be immunized against diphtheria by injection of toxin-anti-toxin. All children over 5 years of age should receive the Schick test; those reacting positively should be immunized. Daily inspection of children for fever, sore throat or croupy cough is recommended during the prevalence of the disease.	Quarantine and isolate case until two negative cultures are obtained from nose and throat taken 24 hours apart. In absence of laboratory test, cases should be quarantined for 21 days from beginning of disease. Wage earners of patient's family should be released from quarantine immediately after one negative culture each from nose and throat is obtained.
None.	Same for measles.	Usually a mild disease with few or no after-effects. Precautions should not be neglected.	Isolate patient 10 days—Concurrent disinfection.
None.	Sick child can not attend school until 4 days after temperature becomes normal and abnormal manifestations have disappeared. Well children from infected homes can not attend school.	An exceedingly infectious malady frequently followed by serious after-effects. The patient should be kept in a recumbent position until 4 days after the temperature has become normal or longer if necessary.	Prevent the promiscuous transference of saliva.
None.	Sick child can not attend school. Children from infected homes who have had measles may attend school. Well children from infected homes who have not had measles may not attend school.	A malady which is infectious even before the rash appears. Complications such as broncho-pneumonia, middle ear disease, weakness of the eyes and even tuberculosis may ensue. The after-effects are much more serious than the disease itself.	Quarantine and isolate cases for 14 days—concurrent disinfection.
None.	Sick child can not attend school until 2 weeks after onset of disease and 1 week after disappearance of swelling. Well children from infected homes may not attend school until 21 days after last exposure to known cases.	Because of the infectiousness of the disease attempts should be made to observe early symptoms and exclude immediately persons showing symptoms.	Isolate patient until parotid glands return to normal. Contacts should be excluded from public gatherings for 21 days from date of last exposure.
Marked leukocytosis in severe cases. May be some eosinophilia. Urine may show albumen.	Sick child must be excluded from school for at least 6 weeks and until membranes are normal and discharges have ceased. Well children may be admitted to school after 7 days of exclusion, provided they have been removed from infected home during that period and are free from the disease.	When the disease is present a daily inspection of the school children should be made for the purpose of detecting early cases. Sore throat, fever or feeling of illness should be deemed sufficient for the exclusion of a child from school. The disease is dangerous both during and after the attack. Complications are frequent. A certain percentage of cases of scarlet fever do not have a distinct rash. Quite an additional number of cases have only a slight rash on some parts of the body, the rash disappearing within a few hours. The failure to recognize these obscure cases is undoubtedly responsible for the occurrence of many additional cases.	Quarantine and isolate cases for 28 days from beginning of disease or until all discharges from ears or glands have ceased without regard to desquamation. Contacts should be isolated for 7 days. Disinfect all discharges. Pasteurize milk.
Primary leukocytosis, then lymphocytosis, then eosinophilia. Examine smear from sputum of early stages and culture same.	Sick child must be excluded from school at least 8 weeks after onset. Well children from same home may attend school provided they are removed from infected premises for period of 14 days.	Whooping cough is especially infectious during its early stages. The disease is particularly fatal to children under 5 years of age and may cause prolonged debility at all ages.	Isolate child 2 weeks after whoop.

EXCLUSION FROM SCHOOL

Teachers should send home at once any pupil with a severe cough, a severe cold, itch, lice or other vermin or any contagious skin disease; also children who are filthy in body or clothing, or who have any dangerous contagious or infectious disease.

IMPETIGO "CONTAGIOUS SORE"

Sores which soon form loose scales. Appear principally on face, also may appear on back of hands. The usual treatment is to apply ammoniated mercurial ointment (10% strength). Child should use separate towels. Very contagious, especially in the spring. Exclude child until sores have disappeared.

Nervous System.

MEDICAL TERMS

Ab—meaning From. The word abnormal meaning behaving or acting from the normal which is to say different from the regular.

Acute—Used in two ways. One meaning sharp, stinging, disturbing, equal to directing all attention to it, biting such as acute pain, or toothache. 2. What is short, or new, or recent by acquired. An acute disease is one just "caught" in an organ not before affected. An acute appendicitis is one that has just become diseased in an organ supposed to be normal.

Bacteria.

Coccus—Bacteria that are round or in the shape of a ball.

Bacillus—Bacteria that have the shape of rods or straight lines.

Spirillum—Bacteria that have a coil-like form that are stiff.

Spirochaete—Bacteria that are in the form of wavy hair and are flexible.

Chronic—Applied to inflammations and other conditions that have been acute and instead of going on to cure have become continuously affected or diseased. They may apparently have recovered as regards symptoms and still have remained diseased. A patient may have an "acute appendix." Pain, tenderness, nausea, vomiting, fever and all these subside. Repeated attacks with intervals of seeming good health will however reveal the disease has become chronic.

Cesarean Section—Delivery of child by a laparotomy.

Diagnosis—The art of telling the points of difference that one disease has from the others and in that way arriving at the nature of the affection with which any given case may be diseased.

Clinical Diagnosis—That obtained at the bedside based on the symptoms present during life, usually in conjunction with the past experience of the doctor; and not taking in account the laboratory or other such findings.

Differential Diagnosis—Telling one disease from another which is different.

Exclusion—Ruling other out.

Laboratory—Obtained by tests of blood, urine, sputum, and the examination of bacteria.

Pathological—Founded on the texture of a removed piece of a diseased organ. Also its microscopic aspect.

En—Usually refers to the condition as within or inside the membranes covering (Walls) Encephalitis. Inflammation of the inside of the brain itself.

Endo—Means on the inside as well. Endocarditis, an inflammation on the inside of the heart or in its cavity.

Ecto—A term meaning without.

Ectomy—Usually means in following a name, to cut out—Gastrectomy—to cut out stomach: Appendectomy—to cut out appendix: Cystectomy—to cut out a cyst. Although it usually applies to a bladder, it furthermore usually refers to the Gall Bladder.

Filterable Virus—Toxins or poisons which slip through all the barriers at present known to collect such material. It is as though you were using a sieve and some of the particles were still too small to be collected by the mesh.

Immunity—The ability to "not take or catch" a disease. It is of two main kinds.

NATURAL IMMUNITY—The one we have within our own bodies, so to speak.

ACQUIRED IMMUNITY—The one we induce in ourselves when we are vaccinated or have protective serum injected into our bodies. This may be done in gradually increasing small doses as in the injection against "Hay Fever" or in one dose to protect other members of the family when a single case of Diphtheria has developed.

Itis—This means an inflammation of the part of the body to whose name it happens to be attached. For instance Tonsil. The small organ at the back part of the throat. Inflammation of it is called Tonsillitis. Mastoid—Mastoiditis. Appendix—Appendicitis.

Laparotomy—A term now used to mean any opening through into the abdominal organs. An operation for Appendicitis is a Laparotomy. As is also one for the removal of an Ovary.

Peri—Means around. For instance if the tonsilar inflammation extends around the tonsil as well as in the organ itself, it is called Peritonsilar Abscess or a Peritonsillitis. Pericardium means around the heart. Periosteum—around the bone.

Normal—The way healthy organs were when they were born subject to the usual and prescribed rules of growth. That is the usual composition and structure of the tissues of the body as they exist when unaffected by disease or injury, and are performing their functions in the regular manner.

Pneumococcus—Coccus or bacteria of Pneumonia. Streptococcus occurs in chains, the germ of virulent Blood Poisoning.

Staphylococcus—Coccus in the clusters like grapes when preceded by the word pyogenes —means they form pus.

ALBUS—White pus.

AUREUS—Golden yellow pus.

CITREUS—Lemon yellow pus.

It is well to recall these names, difficult as they first appear on reading them, because each one of them have characteristics as different as one species of dog has from another.

Streptococcus—A much dreaded organism. Its introduction through a wound is what usually causes the short infections of blood poisoning that quickly terminate in death. The Staphylococcus, Aureus and other forms are virulent but not so violent usually in their activities. Whenever you get a wound and it has violent symptoms of inflammation with red-

dish streaks running up a limb or away from the scene of injury, you will do well to at once repair to a competent authority and find out just which one of these organisms has been the cause.

Serum—This is the plasma or serum obtained from animals who have been given a disease and as they arrive at the condition where they "throw it off" then their blood is withdrawn. In many diseases, the bacteria attack the human body with such vigor that the natural fighting machinery of the blood cannot make antitoxin fast enough to act as a complete antidote to the attacking poison. When you give antitoxin of any kind you are only adding the fighting antitoxic serum of a horse or other animal to that of the sick person's—it is like the slang phrase "Every little bit added to what you got, makes a little bit more." Say you could measure it in ounces (which of course you cannot) and you had a child with Diphtheria. Say the poison was two ounces. The child's resistance in antitoxin one ounce. Now you add two ounces of a horse's antitoxin. That would make three against two and the child would get well. The only thing to remember is not to mix animal and human blood together very often. If you do a condition of serum sickness or anaphylaxis will follow.

Tests:

Wasserman Test—To determine the presence of Syphilis from blood or spinal fluid.

Fehlings Test—A test for sugar in the urine. Used in Diabetes.

Albumin Test—A test for albumin in urine. Used in Brights Disease or to determine poor kidney function.

Specific Gravity—Comparing the urine with that of distilled or pure water.

Reaction—Testing any liquid to see if it is acid or alkaline.

Basal Metabolism—A test with a special apparatus which measures the composition of the ventilation products of the air in the lungs and gives you an idea how the body is burning up its energy.

Microscopical Examination of Urine—Putting the urine through a centrifuge, which whirls out the sediment. This is examined for casts, bacteria, pus, blood, urea, uric acid and the cells of the kidney and bladder.

Twilight Sleep—Formerly extensively used but not now so common. Use of Morphine and a drug called SCOPOLAMIN to render patient as acting to stimulus of pain but not keeping it in her memory when in labor.

Vaccine—The well known clear fluid taken from cowpox blister or vesicle which inoculates against smallpox. This is now prepared in elaborate laboratories, the very last word in cleanliness and is taken from inoculated calves whose antecedents are proven healthy. Vaccines are also prepared against other diseases. They are however obtained after inoculation with bacteria and themselves. Typhoid is the chief disease protected against. This is a highly successful procedure and made Typhoid Fever almost a negligible disease in the late war.

Common colds, aches, boils and many others have a vaccine. They have not been altogether accepted by all physicians but that of Typhoid as a preventive not as a cure is a efficacious as vaccination against smallpox.

Babylonian and Assyrian Literature.—The majority of modern students of language consider that it is very probable the Sumerian language, spoken by the earliest inhabitants of the valley of the Euphrates, is the oldest language of which we have any knowledge. In that locality recent excavations have revealed a great quantity of clay tablets bearing characters written in the peculiar wedge-shaped letters known as cuneiform inscriptions. These have been deciphered and are found to be records in the Sumerian language, which seems to have persisted in written records long after the people themselves had merged with the Babylonian races. Only a very slight fraction of the great wealth of the early literature that is buried along this locality has yet been discovered, but sufficient is known to render it very probable that the first place in which written records were made, of which we have any knowledge, is among the Babylonians. The language was Semitic, and the Babylonian differed from the Assyrian only in a few variations of dialect. Everything points to a common Aryan origin; in no sense did the Babylonians borrow from the Egyptians. Clay was used as an ordinary writing material among the earliest Babylonians, but they inscribed upon stone the records which they desired to be permanent. Assurbanipal, a king of Assyria, caused copies of this earlier literature to be made, and some of it dates back earlier than 2000 B. C. It comprises hymns, prayers, incantations, myths, legends, and poems. Among the records are a great many commercial and legal cabinets, which are abundant in European and American museums. These range all the way from 3000 B. C. down to 200 B. C., and are exceedingly valuable as throwing light upon the history, manners, and customs of the people during many of the past centuries. There is every prospect that the gaps in the complete record will all be filled up by discoveries of new material which the excavations are constantly yielding. So important has this great mass of literature been to the students of past history that since 1890 it has been possible to almost wholly reconstruct the records of early Babylonian and Assyrian history from them. Under the patronage of the Assyrian kings the great library at Nineveh, instituted by the removal hither of that at Cabah, obtained a wonderful collection of tablets and books systematically arranged in every known department of knowledge. This library was destroyed in 625 B. C. when Nineveh fell. Nebuchadnezzar formed a great royal library, of which we have probably exaggerated accounts, and this, too, disappeared with the fall of Babylon. The contents of these libraries were private property of the kings.

EGYPTIAN LITERATURE.

Such papyri as we now possess are sufficient to show that ancient Egyptian literature was very extensive. The pyramids of the VI. and VII. dynasties bear rock-cut inscriptions of a religious nature. These are generally magical, for the religion of ancient Egypt was saturated with belief in magic. The famous *Book of the Dead* is, in its earlier chapters, little more than a series of incantations and assurances to the soul of the dead of its future welfare. Translation of hieroglyphics shows a complete absence of any works of a philosophical or speculative character. The nearest approach to this department of literature is a number of moral maxims or proverbs, all of an extremely practical nature. Such are the *Proverbs of Ptah-hotep* and the *Prescriptions of Ani*. The same practical vein runs through their works on science. The *Rhind Papyrus*, preserved in the British Museum, is the most important work on Egyptian mathematics which we have. It is a collection of arithmetical and geometrical solutions of problems of a very practical sort.

The *Papyrus Ebers*, written about 1550 B. C., is an extensive medical work. It deals only with the treatment of disease, and the prescriptions which it contains are in many cases disgusting and always empirical. Magical incantations play an important part in increasing the efficacy of the treatment prescribed. A fuller collection of these religious and medical incantations has been preserved in the *Harris Magical Papyrus*.

The *Turin Papyrus* gives an admirable and interesting illustration of civil and criminal law procedure, especially as no code or collection of Egyptian laws has come down to us. The *Abbott Papyrus* further illustrates these in describing the procedure in an investigation into tomb robberies in the reign of Rameses IX. (about 1100 B. C.).

Egyptian poetry is modeled upon that of the XII. dynasty. The only epic poem which remains describes the victory of Rameses II. over the Hittites at Kadesh on the Orontes. Lyric poetry abounds in the form of many really fine hymns and a few love-songs.

In the narration of tales and stories the Egyptians excelled all other Oriental nations, and the professional story-teller appeared in public places in ancient Egypt just as he does in Cairo to-day. The *Papyrus Westcar* contains a collection of stories dating from the Middle Empire. The story of the *Fated Prince* which is contained in the *Papyrus Harris*, though incomplete, is interesting in its treatment of a theme common in the folklore of all nations. The *Tale of Two Brothers* contained in the *Orbiney Papyrus* is complete. The story of the *Shipwrecked Mariner* gives play to the Egyptian love of adventure in simple, unaffected narrative, while the *Story of Sinuhe* and that of the *Eloquent Peasant* are heavily laden with a florid and ornate style and filled with rhetorical extravagances. Later Egyptian fiction, however, returns in the Ptolemaic era to the simple narrative, where the plot is essential and quick movement is the rule.

CHINESE LITERATURE.

The history of Chinese literature goes back, perhaps 18 or 20 centuries B. C. We do not find in China any lasting monuments like those of Babylon and Assyria upon which by inscriptions the early writings might be recorded. The earliest gathering together of the Chinese literature that we know of was in the sixth century B. C. when Confucius edited the famous *Ching* or *King*, a sacred canon. From this we know that already a great mass of both prose and poetry existed in China. This classic stands in a unique position among the early writings of the world in that it has exerted a marvelous influence upon the manners, morals, and customs of the nation down to the present day. It forms as interesting a literary collection as can be found anywhere among ancient writings. Thousands of volumes of commentary and discussion have been based upon this work which for over 3,000 years has been the model of literary style, the means of preserving the form of their remarkable language, and of prescribing the social life and the government of so many millions of people. As a record of authentic ancient history China is easily in the first rank of the Asiatic nations for reliable information concerning the early ages. Mencius, the greatest follower of Confucius, adds to the work and gives an elaborate exposition of the teachings of Confucius and sets forth the principles of his philosophy in what is known as the *Book of Mencius*. This group of works has dominated the minds of the people and has subordinated all other teachings, making it the backbone of extreme conservatism of the nation in all of the departments of national life. When, in 213 B. C., the emperor Chin found his reforms opposed by this spirit of conservatism which the writings of Confucius imposed upon the people, he ordered the destruction of all books in the hope that he would in this way be able to overcome the opposition of the *literati*. The only books spared were those upon science, agriculture, and divination. This thorough destruction of literature forms an epoch in Chinese history. But Chin's reign was short, and the Han dynasty (200 B. C.—200 A. D.) which succeeded instituted one of the most zealous revivals of learning that history has ever witnessed. In this revival there was a remarkable development of poetical and historical writing which is in distinct and marked contrast with the severe canonical restrictions of the age of Confucius. It is to this period that the work of Sze-ma Ch'ien (born 145 B. C.) belongs. His *Historical Record* gives the history of China from the beginning down to the author's own times in 526,500 words, all originally scratched with a stylus upon bamboo sheets. So thoroughly and devotedly has this work been studied that it forms even to this day the model of style for all historical treatises. Each succeeding dynasty caused the records of its rule to be added faithfully to the original record, so that in 1747 the work consisted of 219 volumes in which the national history had been revised and condensed. Other noted Chinese historians are Sze-ma Kwang, who wrote a history in 360 volumes in the eleventh century, and Chu Fu-tz', who wrote an abridgment in 55 volumes in the twelfth century.

Among the comparatively few works of foreign travel, for which the Chinese were never noted, are the accounts of the Buddhist pilgrims, Fa Hsien in the fourth century, and Hsuan Tsang

in the seventh century. These record travel in India and preserve much Buddhist literature which would otherwise have been lost in the extinction of India.

The intellectual life of China reached its zenith in the T'ang dynasty (600-900 A. D.), The names of the poets of this period are legion, and a "Complete Collection" was published in 1707. It contains 50,000 poems in 900 books. The most noted names of this period are Li Po (705-762) and Tu Fu (712-770), both court favorites and very popular among all classes. Their names have been household words in China for more than a thousand years. Han Yu (768-824) is a name venerated for nobility of character, probity and ability in high office, and refinement and excellence of literary style. Parts of his works are even now read at Chinese funeral exercises and others form an important part of the repertoire of school and public readers.

While there is a marked and rapid decline in the originality and power of the writers after the great golden T'ang period of Chinese literature, yet several noted names appear in the tenth and eleventh centuries. Valuable historical works were written by Sze-ma Kwang (1019-1086) and Chu Hsi (1130-1200). The latter was one of the most remarkable men of his country. He was not only a historian of ability but as a philosopher he interpreted the work of Confucius into that system or code which is now known to the outside world as Confucianism.

The invention of block printing in the tenth century caused a great increase in bookmaking and in the formation of libraries. While the Mongols added nothing to the intellectual life of China, it was during the period of their control that the Chinese drama was evolved and developed, and novels and short stories were introduced. Chinese plays are not long, as is erroneously supposed in the West. They are short and the plot often ingenious and melodramatic, but never complicated. The sessions at the playhouses are long, but a number of plays are presented in rapid succession without scenery. During the Ming (1368-1644) and present dynasties novels have developed with increasing and absorbing interest, though the plot is often too complicated and the characters too numerous to suit the Western ideas. Chinese short stories are admirable and some of them rank among the world's best, such as *Strange Stories* published in 1679.

Chinese later literature abounds in dictionaries and encyclopedias—one of the latter being complete in 5,600 volumes. No other country can present anything to compare with China in this department; but they can hardly be classed as literature.

Taken as a whole, Chinese intellectual development is most praiseworthy and creditable to any nation. More attention is being devoted to its study by Western scholars and every year reveals much to be admired in it, though through the difficulties of the language it suffers in translation more than the literature of other nations.

The labors of various European travelers and students have given us specimens of almost every description of Chinese literature. In legislation, we have a translation of the penal code of the Empire; in politics and morals, the sacred books of Confucius, and his successor Mencius; in philology and belles-lettres, a well-executed dictionary of the language; several translations and abstracts of history; and selections from the drama, criticism, and romance. Among the most successful explorers of the field of Chinese literature, we may mention Staunton, Davis, Morrison, Klaproth, and Rémusat, who have followed up the earlier researches of the Jesuits at Peking, and elucidated a subject which had been supposed to be inaccessible.

HEBREW AND JEWISH LITERATURE.

The earliest known writings in Palestine are the Tel el-Amarna letters which date about 1400 B. C. It is, however, probable that a knowledge of writing was general among the Hebrews about 1000 B. C. The greater part of ancient Hebrew literature which is known to us is contained in the Old Testament, which covers a period of about 900 years,—from 1000 B. C. to about 100 B. C. There are in addition some apocryphal books, such as the *Book of Ecclesiasticus*, written by Jesus Sirach about 180 B. C. A large portion of the originals of this work has recently been discovered. The oldest portions of this literature are the poetical portions, such as the *Song of Deborah* in Judges v., the *Fable of Jotham* in Judges ix., and the *Elegy of Saul and Jonathan* in II. Samuel i. The earliest collections of traditions and legends date from the tenth and ninth centuries B. C. Legal codes, such as are to be seen in the *Book of the Covenant* in Exodus xxi. and xxii., date from the tenth century B. C. The discourses of the prophets date from the eighth century B. C., while the latest sections are of the third century B. C. The great body of the religious poetry such as the *Psalms* and such philosophical productions as the Books of *Ecclesiastes* and *Job* were written after the return from exile. At that time a college of learned men under the direction of Ezra gathered together the remains of Hebrew literature, and from their labors we have received the books of the Old Testament in their present form.

This period of literary activity is considered the first period of Jewish literature as distinguished from the ancient Hebrew literature. The second period of Jewish literature dates from 143 B. C. to 135 A. D. In this period the *Midrash*, or inquiry into the meaning of the Old Testament, was divided into the *Halacha*, or authoritative and binding civil and religious law, and the *Haggada*, which was a free poetical dissertation on the whole body of the Old Testament. The *Midrash* was the center of all Jewish mental activity for over 1500 years. To this second period also belong all of the *Apocrypha* and the earliest Jewish writings on Christianity. Josephus, Philo, Hillel, Shammai, Johanan ben-Zakkai, Gamaliel, Eleazar ben-Hyrcan, Joshua ben-Hananya, Ishmael, and Akiba are among the great names of the second period. To the third period (175-475) belong the flourishing schools of Galilee, Syria, Rome, and Babylonia in which instruction was given in the *Halacha* and the *Haggada*. The masters of the *Mishna*, the body of "oral law," and the *Talmud*, the comprehensive compilation of laws and ceremonial regulations pertaining to rabbin-

ical Judaism and the discussion of the same, were Eleazar ben-Jacob, Jehuda, Jose, Meir, Simeon ben-Yehai, Jehuda the Holy, Nathan, Hiyya, Rab, Samuel, Johanan, Hunna, Rabba, Rava, Papa, Ashe, and Abina. In 340, Hillel II. fixed the Jewish calendar. The fourth period extended from 475 to 740. During this time the Jews adopted the language of the country in which they lived and the greatest part of the literature is of translation of the *Talmud* and other works into the several languages. Little remains of the works of the eminent physicians of the period. In the fifth period, from 740 to 1040, the Oriental Jews were stimulated by the great activity of the Arabs, and names of many physicians, astronomers, grammarians, commentators, and historians are famous in the literature of this period. The oldest prayer book was drawn up in 880, and the first Talmudic dictionary in 900. In this period are such names as Saadia (died 942), famous in nearly all departments of knowledge; Sherira (died 998) and his son Hai (died 1038) who wrote a dictionary. Spain and Egypt became the great seats of Jewish literature after the suppression of the Babylonian schools in 1040. In the eighth century Hebrew rhyme was produced. The sixth period, which extended from 1040 to 1204, was the most splendid in Jewish medieval literature. The Jews in Spain devoted their energies to almost every branch of literature and wrote in Arabic, rabbinical Hebrew, and ancient or classical Hebrew. The greatest names among them were Samuel Halevi, the great doctor (died 1055), and the celebrated Maimonides, who died in 1204. The French and German Jews attained very great fame. The seventh period (from 1204 to 1492) shows distinctly the influence of Maimonides. The most famous writers of this period lived in Spain, and, later, in Portugal, Provence, and Italy. The first Hebrew books ever printed were produced in Italy between the years 1475 and 1477. The eighth period extended from 1492 to 1755. The ninth period includes the years from 1755 to the present time. In these two periods the names of brilliant Jewish writers increased so that it is impossible to give even the names of the most illustrious. But it may be safely said that there is no civilized country which is not proud to record the names of eminent Jews among the great literary men of every department of literature. Everywhere they take a leading part in the intellectual progress of the age; and there is hardly a university of note which does not number Jews among the most learned professors.

SANSKRIT LITERATURE.

Sanskrit literature, like the language, may be divided into two periods: the Vedic and the Sanskrit. The chief point of difference is that the literature of the Vedic period is always sacred and that of the Sanskritic period is nearly always profane. The *Vedas* are the oldest books of the Hindus and, in the opinion of great philologists, date back to the fifteenth century B. C. They are the sacred books or the Bible of the Hindus written in poetry in the most ancient form of the Sanskrit language. The *Vedas* are three in number: first the *Rig-Veda*, containing hymns and mystic prayers; second the *Yajur-Veda*, containing the religious rites; and third the *Sama-Veda*, composed of prayers in the form of hymns or psalms. These writings are believed to be inspired. They treat of the 33 gods of the heavens, of the air, and of the earth; of the creation of all things; of the relation of the gods to each other; of the relations and duties of men to each other and to the gods; of surgery, medicine, music, dancing, war, architecture, mechanical arts, astronomy, astrology, grammar, poetry, etc. The *Vedas* were first translated into English by Sir William Jones, about 1790. The individual writers of the Vedic literature are practically unknown, as the books are the work of families of poets or schools of religious learning. The *Brahmanas* are divisions of Vedic literature which relate to prayer and sacrifice. They are of a later period than the hymns. The *Upanishads* are speculations of a philosophical and theological nature found usually at the end of the *Brahmanas*. The earliest of the *Upanishads* can hardly be dated later than the year 600 B. C.

Sanskrit literature includes epic, lyric, didactic, dramatic, and narrative. The great epic is the *Mahabharata* or the story of the *Bharatas*. It is a composite work dating in the form in which it has come down to us from about 200 B. C. with additions from time to time down to 100 A. D. It consists of 18 books of 100,000 stanzas. The Bharata war which the epic describes is thought to have occurred in the twelfth century B. C. The *Ramayana* is the second of the two great epics of India. Unlike the works which precede it, this epic is mainly the work of one poet, Valmiki. It ranks with the great epics of the world and is to-day the favorite poem of the Hindus. In its 50,000 lines it describes the youth of Rama, the incarnation of the god Vishnu, and his banishment and residence in central India. The *Puranas* are a mixture of the epic, didactic, and cosmogonic, dating from the sixth to the fourteenth centuries A. D. They are 18 in number and relate chiefly to mythological legends. They form a sort of religious manual for the people and deal almost exclusively with the worship of Siva and Vishnu. Epic poetry reaches its highest perfection in the works of the great poet Kalidasa in the sixth century A. D. *The Birth of the War God* and the *Race of Raghu* are his most artistic epic poems.

In Sanskrit lyric poetry also Kalidasa is the leader. His elaborate long lyrics, the *Cloud Messenger* and the *Cycle of Seasons*, are famous examples. Short lyric verses were a favorite form of poetry for which Bhartrihari is the most famous. He lived in the seventh century A. D. and is the most remarkable Sanskrit poet after Kalidasa. Amaru, who wrote the *Century of Amaru*, is perhaps better known than Bhartrihari, because of his mastery of the erotic phase of lyric verse. But Hindu poetry and prose is always marked by the presence of speculative and reflective expression so that much of the writing is at once capable of classification in several departments of literature. The proverb is a favorite form of expression in Hindu writing and more than 8000 stanzas of this nature have been collected from Sanskrit writings. Such is largely the work of Bhartrihari; Silhana in his *Century of Tranquillity;* and the *Hamer of Folly.*

In didactic literature the most famous examples are the *Pancatantra* and the *Hitopadesa*. The *Pancatantra* is the great collection of beast-fables of the Hindus. It dates from the fifth century A. D., and is the work of probably many hands. The *Hitopadesa* or *Book of Good Counsel* is a collection of fables which have passed into the literatures of the whole world.

The chief dramatic writer, too, of India is Kalidasa, at once a master of the epic, lyric, and dramatic. One drama antedates his work. It was written at the court of King Sudraka, probably by Dandin. Later than Kalidasa are the works of King Harsha in the seventh century; Bhavabhuti, who ranks next to Kalidasa in the drama, and Viskhadatta, both in the eighth century.

The most interesting phase of Sanskrit writings is the fable and the fairy tale. Besides the *Pancatantra* and the *Hitopadesa*, which deal with fables, there is the *Oceans of Rivers of Stories* composed by Somadeva, a Kashmirian poet about 1070, which is the most famous collection of fairy tales. There are also the *Seventy Stories of the Parrot*, the *Twenty-five Tales of the Vampire*, and the *Thirty-two Stories of the Lion-Seat or Throne*.

In prose romance there are the works of Dandin who wrote the *Adventures of the Ten Princes* in the sixth century A. D.; of Subandhu, a little later; and of Bana, a writer of novels in the seventh century A. D.

Indian literature abounds in works of science, from the grammars of Panini, one of the greatest grammarians of all time, and from his commentators, Katyayana and Patanjali, down through the gift of the so-called Arabic numerals to the Arabs, to the medical works of Caraka, chief physician to King Kanishka, in the first century A. D.

PERSIAN LITERATURE.

The literature of Persia falls into four divisions: (1) The Old Persian cuneiform inscriptions of the Achæmenian kings; (2) the *Avesta*, including the more ancient Gâthâs, believed to date from the time of Zoroaster; (3) the Pahlavi literature; and (4) the post-Mohammedan or "Modern Persian" literature, which latter is generally what is understood as "Persian Literature." The Achæmenian inscriptions may be regarded rather as historical than literary monuments, and we may pass to the one classic which represents the literature of ancient Persia. This is the *Avesta*, of which only a fragment has come down to us, and which embodies the religious system of Zarathustra (Zoroaster).

The language of the *Avesta* is termed Avestic, but is often improperly called Zenda. The misleading term, *Zend Avesta*, really means "Avesta and Zend," that is, the original text of the Zoroastrian scripture, and the Zend or "Explanation" (translation and commentary) which accompanies it. The Zend is written in the Pahlavi language, different altogether from that of the text. By analogy it is as if some old Anglo-Saxon fragment had been "explained" in the middle English of Chaucer.

The Pahlavi literature consists chiefly of translations of Avesta texts, and of a number of religious works and commentaries of Pahlavi texts. Of non-religious subjects only 11 works have come down to us, containing not more than 41,000 words altogether. Pahlavi was essentially the Persian literature of the Sâsânian period, though it continued to about the ninth or tenth century. No poetry has come down to us from Sâsânian times, and scholars are not agreed as to whether such poetry ever existed.

In 641 the Persians were defeated by the Arabs at the battle of Nehavend, and with the fall of Merv in 651, the Moslem conquest was complete. The growth of a national literature was retarded, for during the Arab dominion Arabic was the chief medium in Persia, both for prose and poetry. Under the semi-independent dynasties, the Saffârids, Sâmânids, and earlier Tâhirids, the use of Persian was revived as a literary language.

The oldest poem written in modern Persian that has come down to us is a short ode by Abbas of Merv, at the beginning of the ninth century. The founder of the new school of Persian literature proper was the blind poet Rudagi, who died about 950, and who was pronounced by his contemporaries as "peerless amongst the Arabs and Persians." The language of Rudagi and his followers was surcharged with Arabic words, and their poems were but echoes of Arabic poetry.

The famous Sultan Mahmud of Ghazni, who reigned from 998 to 1030, was the greatest patron of literature that Persia had hitherto known. His court was the home of 400 poets, of whom one was elected as "King of the Poets," or laureate—an office which has continued to the present day.

The works of these poets consisted chiefly of occasional odes and panegyrics, with a sprinkling of lyrics in honor of some imaginary beauty. These were arranged in *divans* or collections, and were for the most part modeled on the *ghazal* of the Arabs. The ghazal is a form of poetical composition, consisting usually of 12 couplets, into the last of which the poet invariably introduces his nom de plume. The Arabic *kasida*, corresponding to the Greek *idyllium*, or our elegy, was also freely copied. It was at the court of the great Mahmud that Firdausi flourished, the Homer of Iran, and the author of the great Persian national epic, the *Shâhnâma*, or "Book of Kings," completed in the year 1010 and containing about 60,000 couplets. Though not the founder of the epic style in Persian he was its greatest exponent.

The epic was foreign to Arabic poetry, and was essentially Persian in growth and origin. The national spirit, though suppressed, was not extinguished by the flame of Islam. Firdausi's famous epic recorded the old legendary story of Iran from the creation of the world to the fall of the Sâsânian dynasty in 641. In the field of pure romance the greatest figure is Nizami (died 1203), who composed five romantic poems. The last of this school and the last poet of the classical period was Jami (1414-1492).

Not only the epic but the *ruba'i* or quatrain (from Arabic *raba'a*, four) was native to the Persian genius; the examples best known to the West are the quatrains of Omar Khayyam (died 1123). The other great lyrist was Hafiz, noted for his famous ghazals. Among his many imitators the most prominent was Baba Fighani of Shiraz (died 1516 or 1519), known as "the

minor Hafiz." In the Persian lyric proper, love and wine are the predominating themes; but in reading these poems the esoteric or Sufiistic meaning must ever be borne in mind.

Parody is closely allied to the lyric, and in this connection must be mentioned Abu Ishak (died 1427), who sang of gastronomical glories. Still more closely related to lyric poetry is the religious and didactic poetry, equally permeated by the spirit of Sufiism. The foremost writer of the mystic poetry was Jalal-ud-Din Rumi (1207-1273), whose *Divan* and *Mathnavi* are among the most important sources for the study of Sufiism. His greatest predecessor was undoubtedly Farid-ud-Din Attar (died 1229), whose *Mantig ut-Tair* (*Bird Parliament*) is a noble allegory of the struggle of the soul to be one with the Infinite. To this class of writing also belongs the great name of Sâdi (died 1291), whose *Gulistán* or *Rose Garden*, and *Bustán* or *Flower Garden* are among the finest didactic poems of the Orient, and Mahmud-Shabistari (died 1317), the writer of the well-known *Gulsán-i-Ráz* or *Rose Garden of Mystery*.

The prose literature is meager in extent, and indifferent in quality, very few of the great writers making use of prose at all. The oldest specimens of prose are Muwaffak's work on pharmacology and Balami's translations of Tabari, both written in the tenth century. The principal historical works are the *Chronicles of Wassaf*, the *Marrow of the Chronicles*, by Khaswini, in 1370, and the *Rauset Essafa*, by Mirchond, written about 1450.

During the last century Persia has produced three poets of a high order of genius, Kaani of Shiraz, Yaghma of Khorasan, and Mirza Serush of Ispahan, all of whom, both in style and diction, rank almost equal with Hafiz and Sâdi. Kaana in particular is noted for his charm of language, and many of his poems are unexcelled in the Persian tongue.

Apart from the miracle play of *Hasan and Hosein*, the drama of Persia is of recent development and unimportant as literature. The present state of Persian literature cannot be called flourishing, and, save in the field of philosophical speculation, serious studies are rarely attempted.

GREEK LITERATURE.

Greek literature is the source from which all European literature has mainly sprung; nor is its quickening energy abated by the centuries. In ethics and logic, as in geometry, the Greeks laid the foundation of all modern thought. Their literature is preëminently original, as befits a race remarkable for its creative genius. The beauty of the mind expressed itself in beauty of form and language. In poetry the Greeks perfected for us the principal types—the epic, lyric, and dramatic; in prose they fashioned well-defined types to suit particular needs—historical, oratorical, philosophical.

Greek literature may be divided into three periods: (1) the Early Literature, from Homer to 475 B. C.; (2) the Attic Literature, from 475 B. C. to 300 B. C.; and (3) the Literature of the Decadence, from 300 B. C. to 529 A. D.

I. The Early Literature. During the early period of Greek literature epic poetry flourished. There are no extant records of any poetry previous to the immortal poems of Homer—the *Iliad* and the *Odyssey*. But these epics were not the crude efforts of a primitive race struggling to record its minstrelsy in the vulgar tongue. They are the finished products of a poetic age, and reveal the skill of a consummate artist. The earliest stages of Greek poetry were closely allied to religion—hymns to the gods, festive marriage hymns, dirges for the dead. In time, poetry assumed a more secular character, and the minstrel (*aoidos*) sang of the deeds of warriors and the clash of war. Narrative or epic poetry gradually took form and became identified with hexameter verse.

The *Iliad* describes one of the final stages in the ten years' siege of Troy, and centers around Achilles and his "wrath." The theme of the *Odyssey* is the return of Odysseus (or Ulysses as he was called by the Romans). It is more domestic than military, and is filled with the wonderful legends that stirred the popular imagination. Little is known of the illustrious bard who wove these legends, lays, and superstitions into an artistic whole. Whether or not the *Iliad* and the *Odyssey* are the work of one poet has been often challenged, but the question admits of no positive proof.

The second author whose works have come down to us is Hesiod. His most important writings are his *Works and Days*, the earliest didactic poem extant, the *Theogony* or *Origin of the Gods*, and the *Catalogues of Women*, of which the well-known *Shield of Heracles* was supposed to be a fragment, although the latter is now held to be of later date. A collection of thirty-three so-called Homeric Hymns has descended to us; these consist of epic preludes designed for the use of the rhapsodists.

As is natural to all literatures, the lyric is of later growth than the epic; the poetry of reflection is of later unfoldment than the poetry of observation. In this early epoch of Greek literature elegiac and iambic poetry arose and the lyric had its birth. Archilochus (670 B. C.) is regarded as the father of lyric poetry. Other noted names are Simonides of Amorgus (660 B. C.), and the famous elegists Callinus, Tyrtaeus, Mimnermus, Solon the great lawgiver, Theognis, Phocylides, Xenophanes the founder of the Eleatic philosophy, Simonides of Ceos (480 B. C.), more celebrated as a lyrist, and Hipponax the outcast of Ephesus.

As lyric poetry was inseparable from music its development kept pace with that of the sister art; for in ancient Greece music formed part of a liberal education. The Æolian School of lyric poetry was rendered famous by the works of Alcaeus, Sappho (610 B. C., a woman of surpassing genius), and Anacreon. The most prominent figures of the Dorian School are Alcman, Stesichorus ("marshal of choruses," whose real name was Tisias), Arion, and Ibycus (540 B.C.). Lyric poetry was Dorian in form but national in spirit. With Simonides of Ceos commenced a new era. Pindar (522 B. C.) became the national lyrist of Greece, and with him lyric poetry culminated. The fragments of his work which have come down to us represent every form of lyrical poem including hymns, panegyrics, dirges, choral dance-songs, and *scolia* or festive songs. The only complete poems of Pindar extant are his *Epinicia* or triumphal odes

celebrating the victories gained respectively in the Olympian, Pythian, Nemean, and Isthmian games. During this early period prose writing began among the Ionian Greeks of Asia Minor, though in a crude form.

II. Attic Literature. During the Attic period, from 475 to 300 B. C., dramatic poetry reached its perfection both in tragedy and comedy. Popular devotion to the drama brought about a decline in lyric poetry, though the dramatic art could not be entirely divorced from the lyric, for the songs of the chorus were an essential feature of the Greek drama. The drama attained its highest excellence in the works of the great trilogy of Greek tragic artists—Æschylus the true founder of tragedy, Sophocles, and Euripides. Besides "satyric" dramas 70 tragedies are attributed to Æschylus, 113 to Sophocles, and 92 to Euripides. Only seven of the tragedies of Æschylus now remain to us: *Prometheus, Seven against Thebes, Agamemnon, Choephori, Eumenides,* the *Supplicants* and the *Persians.* Sophocles was the most perfect tragic writer of classic times. His dramas are marked by skillfully woven plots, clearly delineated characters, and artistic development of the stories. He introduced improvements into the Greek drama, increasing the number of actors from two to three, which was the greatest number allowed on the stage at any one time. His extant plays are: the trilogy of *Oedipus the King, Oedipus at Colonus,* and *Antigone;* the *Death of Ajax;* the *Maidens of Trachis;* the *Philoctetes;* and the *Electra.* These plays of Sophocles give expression to the age of Pericles on its higher moral and intellectual side. Euripides (480 to 406 B. C.) introduces a new order of ideas. His characters are essentially natural and his dramas are marked by great pathos combined with elegance of language; they however lack the artistic finish of the plays of Sophocles. His leading tragedies are *Alcestis, Medea, Iphigenia among the Tauri, Hippolytus, Hecuba,* and *Ion.* The *Cyclops* is the only specimen of a satyric drama that has come down to us.

Like tragedy, Greek comedy originated from the worship of Dionysus. Attic comedy began to take artistic form about 470 B. C., and in the hands of the three great dramatists, Cratinus, Eupolis, and Aristophanes, it reached its highest perfection. The comedies of Aristophanes form a satire on the daily life of the Athenians, and partake somewhat of the nature of burlesque. Aristophanes was great not only as a satirist but as a poet. After his death comedy became more purely social than political, and was represented by Antiphanes, Alexis, and Philippus. The "New" comedy, which flourished chiefly from 320 to 250 B. C., is represented by the poets Menander, Philemon, and Diphilus.

Literary prose was late in being developed, and until the time of the Persian wars the epic was found all-sufficient. During the Attic period the Greeks perfected a prose literature in history, oratory, and philosophical dialogue, and with this new development, coincidental with the passing away of political freedom, strictly creative art is left behind, and we enter an era of learned productions in science and literature. Herodotus, who lived in the fifth century B. C., is regarded as the "father of history," as he was also the first artist in prose. Thucydides may be styled the first philosopher of history. The third historian of the period is Xenophon, whose principal works are the *Anabasis,* the *Cyropaedia,* and the *Memorabilia.*

The most finished specimens of prose are contained in the works of the Attic orators: Antiphon, Andocides, Lysias, Isocrates—the founder of literary rhetorical prose, Isaeus, and Demosthenes—the greatest orator the world has ever produced. The chief contemporaries of Demosthenes were Æschines, Lycurgus, Hypereides, Deinarchus, and Demades. The decline of oratory began with Demetrius Phalereus, who flourished about 318 B. C.

The Greeks were the first nation to separate philosophy from religion. The untrodden field of philosphical thought was entered by Thales of Miletus and his successors, Anaximander and Anaximenes, about six centuries before Christ. The Pythagorean and the Eleatic schools still further grappled with the mysteries of existence. The doctrines of the atomistic philosophers were followed by those of Anaxagoras and the sophists. Then the master mind of Socrates introduced a new method into the inquiry. Socrates left no writings, but fragments of his teachings are preserved for us in the works of his disciples, more especially Xenophon, and the most celebrated philosopher of any age—Plato (429-347 B. C.). No "profane" teacher held a purer conception of God, nor has any writer embodied his thoughts in language more exquisite. His *Republic, Phaedrus, Timaeus, Critias,* and his famous Dialogues, are all masterpieces of literary genius.

The first of Greek scientists, Aristotle (384-322 B. C.), presents us with concise and unadorned reasoning. He was the founder of logic, and discovered the syllogism. His *Ethics* and *Politics* and his conceptions of what is now termed biology have exercised a far-reaching influence on Western thought. After Aristotle the productive energy of Greek philosophy began to decline. Various schools of philosophy flourished about the beginning of the third century B. C.: the minor Socratic schools (Megarics, Cynics, and Cyrenaics), the Epicureans, and the Stoics.

III. The Literature of the Decadence. This may be subdivided into two periods: the Alexandrian, 300-146 B. C., and the Graeco-Roman, 146 B. C.-529 A. D. When the glory departed from Athens after the conquests of Philip of Macedon and Alexander the Great, the city of Alexandria became the center of literature and art. The poetic Pleiades which assembled there consisted of Lycophron, Aratus, Nicander, Theocritus, Philiscus, Æantides, and Homerus. Poetry became artificial in style and derivative in character. Prose held a prominent place but was devoted chiefly to works of science and learning. Theocritus, the pastoral poet, was the greatest of the Pleiades, while with Apollonius Rhodius, Bion, and Moschus, the "silver age" of Greek poetry passed away. The "golden age" had perished with Pindar and his great contemporaries.

Science and learning are represented by Zenodotus, Aristophanes of Byzantium (200 B. C.), Aristarchus, Apollodorus, Euclid, Archimedes, Eratosthenes, the founder of scientific chronology, and the historians Manetho and Berosus.

The first part of the Graeco-Roman period, that is, from the Roman conquest of Greece to the end of the Roman Republic (146-30 B. C.), was devoted to literary and scientific research, and produced a number of histories, lexicons, miscellanies, and the like. The most talented of the historians was Polybius, who ranks next below Herodotus and Thucydides. During the latter part of this era, namely, from Augustus to Justinian (30 B. C.-529 A. D.), a number of writers arose, many of them being more remarkable for industry than for literary merit: Dionysius of Halicarnassus; Plutarch, whose celebrated *Lives* are of undying popularity; Strabo and Pausanias, the geographers; Josephus, the Jewish historian who wrote in Greek; Athenaeus, author of the *Deipnosophistae;* Lucian, Longinus, Libanius, and Heliodorus, noted names in rhetoric and belles lettres; Epictetus, Marcus Aurelius, and the Neoplatonists Plotinus, Porphyry, and Iamblichus, who represent the philosophic thought of the epoch.

No poetry of high merit was produced during these years of decadence. Æsop's fables were versified by Babrius; other notable writers of verse were Oppian, Nonnus, and Quintus Smyrnaeus. The so-called *Sibylline Oracles* and the *Greek Anthology* contained the remainder of all that is interesting or pleasing in the verse of this age. In 529 the schools of heathen philosophy were closed by order of Justinian, and the edict emphasized the fact that the old literature of Greece was dead.

LATIN LITERATURE.

Though all divisions are arbitrary, it will be found that Latin literature divides naturally into six periods, viz.:—

I. A period of crude beginnings, before literature was established, extending from the founding of Rome to the end of the First Punic War (240 B. C.). These beginnings are limited to simple and often coarse ballads, farces, and mimes, popular among the rustics at fairs and merrymakings. It was not until the Romans came into closer contact with the cultured Greeks who lived in the cities of southern Italy that they became aware of their great literary inferiority.

II. A second period, which for lack of a better name may be called the early period of Roman literature, extends from 240 B. C. to 80 B. C. After Rome had conquered for the time her arch-enemy, Carthage, in the First Punic War, she found time to devote herself to the arts of peace. The leisure class turned to a study of Greek culture, and for a time, at the beginning of this period, the literature of Rome consisted chiefly of translations of Greek models into Latin. Livius Andronicus (about 284-204 B. C.), a Greek captive from the taking of Tarentum in 272 B. C., translated Homer's *Odyssey*, fragments of which remain. But the real founder of Latin poetry was Gnæus Nævius (died 204 B. C.), who wrote tragedies and comedies that were very popular with his countrymen. Titus Maccius Plautus (about 254-184 B. C.) displays the greatest genius and a surprising mastery over the difficulties and limitations of the Latin language in his comedies. While we have only very few fragments of the works of his predecessors, we have no fewer than 20 plays from his pen. Great names in Latin literature now follow very rapidly. Quintus Ennius (239-169 B. C.), more popular than Plautus, was styled "the Father of Roman Poetry" and is memorable for his *Satires* and *Annales*. Quintus Fabius Pictor (born about 254 B. C.) was the first important prose historian. The familiar Marcus Porcius Cato (234-149 B. C.), or Cato the Censor, among other great literary qualities was the first Latin orator to write down his speeches. Alimentus (prætor in 210 B. C.) wrote his annals in Greek. The six plays of Terence (about 185-159 B. C.), derived from Greek sources, are faultless in diction and full of merit. Gaius Lucilius (180-103 B. C.) is called "the Father of Roman Satire." The last of the great Latin tragic poets, Lucius Attius (170-94 B. C.), closed the school of the old character-drama. Lucius Afranius closed the old Latin comedy school. Nor must the Gracchi be forgotten in the department of oratory, though their chief characteristic was vehemence.

III. The third period is known as the Golden Age, the Classical Period, or the Ciceronian Period (87-43 B. C.). The latter part is known as the Augustan Age, in which a new spirit is exhibited in Roman literature. In didactic poetry Lucretius surpassed his Grecian masters by the force of thought and the splendor of diction which characterize his great philosophical poem on the origin of the universe. Catullus attempted various styles of poetry, in all of which he obtained eminent success. His lyric and elegiac poems, his epigrams and satires, are marked by singular versatility of feeling, frequent flashes of wit, and rare felicity of expression. Among the elegiac poets, of whose genius we still possess the remains, the highest distinction was gained by Tibullus, Propertius, and Ovid. The former of these poets was pronounced by Quintilian to be the greatest master of elegiac verse; Ovid possessed an uncommon fertility of invention and ease of versification; while Propertius tempers the voluptuous cast of his writings with a certain dignity of thought and vigorous mode of expression. The great lyric poet of the Augustan age is Horace, whose graceful and sportive fancy, combined with his remarkable power of delicate and effective satire, continues to make him a favorite with all who have the slightest tincture of classical learning.

The noblest production of this period, however, is the *Aeneid* of Virgil, which, with his elaborate poem on rural affairs, the *Georgics*, and his sweet and tender pastorals, or *Eclogues*, fairly entitles him to the position, which has been given him by universal consent, of the most gifted epic and didactic poet in Roman literature.

The writings of the Latin prose authors, taken as a whole, betray a higher order of genius and cultivation than the works of the poets. In this department the pre-eminence belongs to Cicero, whose various productions in eloquence, philosophy, and criticism are among the most valuable treasures of antiquity. In history, Cæsar, Sallust, and Livy are the most prominent names, who, each in his own peculiar style, have left models of historical composition which have been the admiration of every subsequent age. The literature of the Augustan

period partook of the general character of the Roman people. Devoted to the realization of practical objects, with slight tendencies to the ideal aspect of things, and absorbed in the exciting games of politics and war, the Romans had little taste either for abstract speculation or for the loftiest flights of poetical fancy. Hence no new system of philosophy was produced in their literature; their best poets were essentially imitative; and of all branches of study, those connected with popular eloquence were held in the greatest esteem.

IV. The fourth period, to mark the decline and its inferiority to the period immediately preceding, is often called the Silver Age. It is post-classical, and receives many important contributions from Spain. It is counted as extending from 17 B. C. to about 130 A. D. While more of the writings of authors of this period survive, they are of only secondary importance. The two Senecas, Mela, Lucan, Columella, Quintilian, Martial, and others were of Spanish origin. The despotic Tiberius (reigned 14-37) exercised a markedly depressing effect upon Roman literature by discouraging it so that men dare not praise the deeds of the past nor record those of the present. Yet the fables of Phædrus in adaptation of those of Æsop, and the great medical work of Celsus belong to this reign. The greatest writings of the succeeding reigns were the philosophical works of Seneca (4 B. C.-65 A. D.). The greatest writer of Vespasian's reign was Pliny the Elder, whose zeal for scientific research caused his death in the destruction of Pompeii by the eruption of Vesuvius. Martial, the court poet of the Emperor Domitian, is the creator of the epigram as we know it, for he invented the use of the sting which the real epigram carries with it. Sextus Julius Frontinus (40-103) was perhaps the most scientific writer of all the Romans. The noblest literary works of the whole period of the Roman Empire are those of the reign of Nerva and Trajan, covering the period from 96 to 117. It is graced by the names of Tacitus, Juvenal, and Pliny the Younger.

V. The fifth period covers the time of the Middle Empire during the second century, marked by the writings of authors of African origin and those of the Early Christian writers. Gaius Suetonius Tranquillus (75-160), author of *Lives of the Caesars*, Florus, Fronto (about 100-175), and Gaius the Jurist (about 110-180) were the chief writers in the reign of Hadrian. Aulus Gellius, author of *Noctes Atticae;* Lucius Apuleius, the rhetorician and philosopher; and the earliest literary work in Latin on Christianity, the *Octavius* of Felix, are of greatest interest in the reign of Marcus Aurelius. In the reigns of Commodus and Severus, Tertullian of Carthage (about 150-230), the defender of Christianity, and Papinian the Jurist are the greatest names.

VI. The sixth and closing period, covering the years from the third to the sixth centuries, marks one of decline in literature from a purely literary point of view. Interest in the numerous writers of the period attaches to subjects upon which those learned men wrote. Saint Cyprian, Bishop of Carthage; the Christian poet Commodius; Lactantius; Avienus; Ausonius; Prudentius; Saint Ambrose, Bishop of Milan; Hieronymus or Saint Jerome; Donatus, the grammarian; Claudianus; Saint Augustine; Bishop Hippo; Apollinaris Sidonius, Bishop of Clermont; Dracontius; Boethius the philosopher; and Cassiodorus, author of the *World-Chronicle*, are among the last names memorable in the department of Latin literature.

ITALIAN LITERATURE.

There is no existing record to show that Italian—the latest developed of the Romance languages—was used for literary purposes before the thirteenth century. Unlike those of France and Germany, the beginnings of Italian literature were not simultaneous with the struggles of a rising people. The nation was versed in the art of expression in other tongues, which accounts for the rapid development of the literature when once the vernacular became a medium for the master minds. At the outset Italy drew mainly from the literature of France, and imitated the lyrics of the troubadours and the heroic songs of the trouvères. Italy had no national epic of its own. The first awakening of Italian poetry was in Sicily in the time of Frederick II., the great patron of letters. Soon afterward religious poetry flourished in Umbria, due to the rise of the two orders of St. Francis and St. Dominic. The drama sprang into being from the same impulse; the *Laude Spirituali* gradually developing into the *Devozione* and the *Rappresentazione*. Meanwhile the poets of Tuscany, stimulated by the influence of Provençal poetry, founded a less conventional school of writing, and established the preëminence of the Tuscan dialect. Three poets are worthy of mention in connection with this school: Guinicelli (1220-1276) the founder, Cavalcanti, and Cino da Pistoja. Of early prose writings the oldest specimen extant is a register of household expenses by Matasala di Spinello of Siena, which, however, cannot be classed as literature. The letters of Guittone d' Arezzo are the earliest existing monument of literary prose; but the first writer of any considerable work was Malespini, who wrote a history of Florence to the year 1282. The real founder of Italian literature is Dante (1265-1321), for previous to him there is not an author of the first or even the second rank. Out of the crudest materials this mighty artist fashioned a monument whose sublimity of conception is equaled by the grandeur and delicacy of his art. The destiny of Italian literature was fixed and defined by his great epic, the *Divina Commedia*, and the era of the Renaissance was ushered in. In this world's classic, Dante voices the beliefs and aspirations of the Middle Ages. Guided by Vergil, he makes a visionary journey through the dread regions of the Inferno and the circling abodes of Purgatory; thence led by the saintly Beatrice he beholds with a seer's vision the manifold glories of Paradise. The greatness of the poem was instantly recognized, and time will never sully the brightness of its fame. Two more names—Petrarch, the greatest Italian lyrist, and Boccaccio, the father of Italian prose—complete the *triumvirate*. Petrarch (1304-1374), "the laureat poete," as Chaucer called him, was the first to place Italy in the van of European literature. He revived the study of the Greek and the Latin authors and restored

the republic of letters. His fame now rests not on his Latin works but on his *Canzoniere* or lyrical poems, inspired by his love for Laura. The exquisite beauty and perfection of these poems place him only a little lower than Dante himself. Boccaccio (1313-1375) by his *Decameron* endowed Italy with a classic prose and earned the distinction of being the first modern novelist.

The century from the death of Boccaccio to the rise of Lorenzo de' Medici is the most barren in the history of Italian literature. Attention, however, was given to the development of the drama and the romantic epic. The most famous of the early dramatists are Feo Belcari (1410-1484), Castellani, Antonia (wife of Bernardo Pulci), Rosselli, and the author of the first classical Italian drama, Angelo Poliziano (1454-1494). The first to raise the literature from the low estate into which it had fallen was Lorenzo de' Medici, named "the Magnificent" (1448-1492), who gave a great impetus to the study of the vernacular, and himself led the way with many graceful poems. His court was the home of artists and men of letters. Among them were Boiardo, author of the *Orlando Innamorato*, and Pulci, author of the epic, *Morgante Maggiore*. One of the features of the times was the founding of the academies of Florence, Naples, and Rome.

In the literary epoch following that of the Renaissance every form of art was perfected, and the Italian character of the language was combined with classicism of style. This Golden Age lasted from 1494 to about 1560. Of the prose writers two figures tower above their contemporaries—Machiavelli and Guicciardini, the chief originators of the science of history based on observation. Machiavelli (1469-1527) is the Thucydides of Italy, as the great Florentine historian Villani in the previous century is her Herodotus. He holds a position in prose similar to that of Dante in poetry. His three most famous works are *The Prince*, *The Art of War*, and the *History of Florence*. No book has aroused more controversy than *The Prince*. By many it has been regarded as a manual for tyrants, and true it is that no book has wrought more harm, for it was the daily companion of the most noted despots of Europe. Yet it was nothing more than the dream of a philosophical patriot for the restitution of liberty to his country. Less illustrious but of a more practical genius is the historian Guicciardini (1482-1540), whose *History of Italy* is one of the most valuable works in the language. Of lesser historians of this period Nardi, Segni, Camillo Porzio, and Cardinal Bembo may be noted. A characteristic product of the age, due to the study of Plato, is the dialogue; and the most typical example of these polished didactic colloquies is the *Cortegiano* of Castiglione (1478-1529). Ariosto (1474-1533) is a great and essentially national poet, who assimilated the romance of chivalry to the style and models of classicism. His great poem, *Orlando Furioso*, the result of ten years' toil, eclipses all previous romances, and has never since been equaled. Its success inspired many imitations, the two most important of which were the *Girone il cortese* of Alamanni and the *Amadigi* of Bernardo Tasso, both of them feeble productions. Not more successful was Trissino (1478-1500) who in his *L'Italia Liberata* made the first attempt to write Italian epic poetry in blank verse. Torquato Tasso published his famous work *Jerusalem Delivered* in 1581. It is a poem of faultless beauty, and is the finest of all epics after the *Aeneid* and *Paradise Lost* (for *Orlando Furioso*, to which it is commonly compared, is not really an epic at all). Tasso achieved immediate success with *Aminta*, a pastoral masque which attracted a host of imitators. The best of these was Guarini, the author of the *Pastor Fido* (1537-1612).

From 1559 began a period of decadence, known in the history of Italian literature as the *Secentismo*. Lyric poetry was represented by mediocre rhymesters. Galeazzo di Tarsia, Vittoria Colonna and her sister poet, Gaspara Stampa, are amongst the noteworthy names. Though in pure literature the age was one of decline, it was an era famous for the advance of natural science, and incidental reference may be made to the names of Galileo, Cassini, Renieri, Torricelli, Valisnieri, Viviani, Bellini, and Redi. The chief name in Italian literature during the seventeenth century is that of Tassoni (1565-1635), whose masterpiece, *La Secchia Rapita*, is a poem of European reputation. Of the minor poets who emulated the extravagances of Marini (1569-1625), the most famous were Guidi, Testi, Ciampoli, Menzini, and Filicaja. Some of the poems of Filicaja reach a high degree of excellence, and his name recalls the famous sonnet, *Italia, Italia, a cui feò la sorte*. A mania for rhyming seized the nation, and dates from the inauguration of the "Arcadian Academy" in 1692. But the Arcadians, the last of whom was Frugoni (1692-1768), replaced with effeminacy the bombast of the Marinists, and only succeeded in impoverishing the literature. But one department of the fine arts, the opera or musical drama, achieved distinction through the genius of Metastasio (1698-1782), who was both a consummate playwright and a true lyric poet. The only other writer of the first rank during this period is Goldoni, the reformer of Italian comedy. Voltaire said of him that he had rescued Italy from the hands of the harlequins. His great rival, Count Carlo Gozzi, won success on the Venetian stage by his *fiabe* or dramatized fairy-tales. Alfieri (1749-1803) swept Italian tragedy with his drastic reforms. Though his writings display what Matthew Arnold calls a "narrow elevation," his style is manly, and he is undoubtedly one of the grandest figures in Italian literature since Tasso. Giuseppe Parini is interesting as being the first Italian poet who shows decided traces of English influence. His *Giorno* is suggestive of Thomson's *Seasons*, but the satire is worthy of Pope. Parini opened the way to the fine school which was now to arise, that of Foscolo, author of the lyrical masterpiece, *I Sepoleri;* Monti, whose *Bassvilliana* gave him rank as the first epic poet of his time; Pindemonte, whose best work is his *Antonio Foscarini;* Manzoni, the representative of the romantic and mediæval reaction of the post-Napoleonic age, and the author of the world-famed *I Promessi Sposi;* Leopardi, whose blank verse is the finest in Italian literature; Niccolini, renowned as a poet and a classical dramatist; Giusti, the Tuscan satirist; Gioberti,

author of the great book, *Il Primato d'Italia;* Pellico, the writer of the famous work, *Le Mie Prigioni.* Love of country is the dominant thought of the nineteenth century writers; and though these include no name of premier rank, yet the pervading spirit of liberty and patriotism lends to the literature of the period a unity and dignity which command our admiration. Aleardo Aleardi (1812-1878) has failed to retain his popularity. His poems are graceful and full of feeling but lack force. Prati (1815-1884), called by Carducci "the last of the troubadours," produced several volumes of lyrics, whose fluency borders on improvisation. Gabriele Rossetti (1783-1854) was the most noted poet in southern Italy. His greatest compositions are *Iddio e l'Uomo* and *L'Arpa Evangelica.* Carducci (1835-1907) is the foremost Italian poet of the past half century, and the greatest force in recent Italian literature. Many of his lyrics are widely known, and the admirable translations of the American, Mr. Sewall, have done much to increase their popularity. Carducci is a critic, too, of no mean order. Zanella (1820-1889) is a poet whose fame has gone on increasing. *The Vigil,* a meditation on evolution, is perhaps his masterpiece. His lyrics are exquisite. D'Annunzio (born 1864) is a second Marini, but his naturalism too often borders on extravagance. In his sonnets he has enriched Italian poetry with one new form of beauty, the *rima nona.* The poet of the social revolution is Mario Rapisardi, a Sicilian; while the woes of the poor are expressed by a lady, Ada Negri. Arnaboldi excelled in grave and dignified lyric, not unlike Matthew Arnold. Arturo Graf, Fogazzaro, Panzacchi, Edmondo de Amicis (celebrated as a traveler), Capuana, Marradi—translated specimens of these and other contemporary poets may be read in G. A. Greene's *Italian Lyrists of To-Day.*

The serious drama is represented by the tragedies of Cavallotti and the New Testament trilogy of Giuseppe Bovio; and the humorous by the comedies of Roberto Bracco and Giacinto Gallina.

Lengthy story-telling seems to be foreign to the genius of the people, and the novelists are mostly of inferior rank. One or two, such as Matilda Serao, Barrili, and Farini have acquired a wider reputation. Two names stand out, however, as masters of fiction, the poet, D'Annunzio, author of *La Vergine della Rocce,* and Giovanni Verga, whose novels reflect the social history of Sicily. In the field of literary criticism the two chief names are Settembrini and De Sanctis. Of modern historians, Villari, the biographer of Savonarola and Machiavelli, and Comparetti, author of *Virgilio nel Medio Evo,* have won a lasting reputation as writers. We cannot conclude without a reference to Giuseppe Mazzini (1805-1872), that "swift, yet still, Ligurian figure; merciful and fierce; true as steel, the word and thought of him limpid as water," as Carlyle finely portrays him. His writings greatly influenced the destinies of his beloved Italy.

SPANISH LITERATURE.

Spanish literature has its root in the old heroic songs and *fabliaux* of early France and Italy. No texts of earlier date than the twelfth century have come down to us. The two oldest extant specimens of Castilian verse are the *Poema del Cid,* and the *Misterio de los Reyes Magos.* The *Cid* is national in tone, and is an epic or *chanson de geste* of about four thousand lines, celebrating the adventures of the great national hero, Ruy Diaz de Bivar (died 1099), better known by the Arabic surname of the Cid. His exploits are also recounted in the *Rhymed Chronicle,* which some suppose to be of older date than the *Poema.* In the thirteenth century religious and didactic poetry grew up, the most noted representative of which is Gonzalo de Berceo (1198-1268). Under Alfonso the Learned (1226-1284) the language became a polished literary medium. Alfonso, like Bacon, took all knowledge as his domain, and in every branch he shone preëminent. He was the creator of Castilian prose. The second great prose-writer was his nephew, Don Juan Manuel, who brought the language to perfection. His best known work is *Conde Lucanor,* a collection of 51 didactic tales. Juan Ruiz (1300-1350), better known as the Archpriest of Hita, is the most original mediaeval Spanish poet. His *Libro de Cantares* gives us a highly-colored picture of the manners of the age. The *Rhymed Chronicle of Alfonso XI.,* discovered in 1573 by Diego Hurtado de Mendoza, was written by Rodrigo Yañez, who is the first to use lines of eight syllables for the purpose of epic narrative. A writer who did not come under the prevailing influence of Provençal and Italian poetry is Pedro López de Ayala (1332-1407), whose best-known work is the *Rimado de Palacio.* He is equally distinguished as a writer of prose. A representative writer of the fifteenth century is Iñigo López de Mendoza, Marqués de Santillana, who wrote both in prose and verse, and was an imitative rather than an original genius. The official court-poet of the time of Juan II. was Juan de Mena, known to his own age as the "Prince of Castilian poets." In contrast to the artificiality of such writers as these is the celebrated elegy of Jorge Manrique on the death of his father, known as the *Coplas de Manrique.* This imperishable poem has been admirably translated by Longfellow. The fifteenth century finds the chivalrous romance established in Spain, and the best example is *Amadis de Gaula.* The introduction of printing presses in 1474 inaugurated an era of translation. Nebrija (1444-1522), the greatest of Spanish humanists, printed his Spanish-Latin dictionary in 1492. It is worthy of note that the first Greek text of the New Testament ever printed was produced by Nebrija at the University of Alcala de Henares, in 1514. Versions of foreign classics were in all men's hands.

With the reign of Charles V. we reach the Golden Age of Spanish literature. Juan Boscán is chiefly noted as having naturalized the Italian eleven-syllable verse. He is seen at his best in the allegorical poems, the *Octava Rima.* In point of merit he is eclipsed by his comrade, Garcilaso de la Vega (1503-1536), a poet of refinement and distinction, whom both Cervantes and Lope de Vega agreed in calling the first of Castilian poets. He certainly is one of the greatest of Spanish poets. As a reproducer of the cadences of the Vergilian Eclogue, his success is unique. Diego Hurtado de Mendoza

(1503-1575), one of the chief figures in the history of Spanish politics and letters, cultivated both the national and the Italian forms of poetry, but lent his weight to the supremacy of the latter. He is the author of two historical works: The *History of the Rebellion and Chastisement of the Moriscos* and the *Guerra de Granada*. Amongst the greatest Spanish poets few, if any, rank higher than Fernando de Herrera (1534-1597). He is the first purely lyrical poet of Spain. Another eminent poet was his contemporary, Luis Ponce de León (1529-1591), who was no less great in prose. The greatest of all Spanish mystic books, *Los Nombres de Cristo*, together with his translation of the Song of Solomon, give him rank with the masters of Castilian prose. The moral and mystic writings of Santa Teresa (1515-1582) have justly won a reputation which is world-wide. She is a sublime figure in the annals of religious thought, and is the only woman who stands as an unchallenged equal with the great writers of literature. Crashaw's famous line will be recalled:—

"O 't is not Spanish but 't is Heaven she speaks."

Her masterpiece is the *Castillo interior*.

At the close of the sixteenth century, Spanish literature, with the exception of the drama, had become stereotyped; the Italian influence had set its seal on form and matter; the chivalresque romance was on the wane; the picaresque novel, modeled on the unclaimed *Lazarillo de Tormes*, was losing its freshness; and until the appearance of Cervantes no genius had arisen to introduce any new type. Miguel de Cervantes Saavedra (1547-1616) is the most illustrious figure in Castilian literature. He is a great creative genius and a universal humorist. He ignored the conventions of the times, and, drawing closely to humanity, he created types which are eternal. As a dramatist he is seen at his best in the tragedy of *Numancia*, and in his comedy, *Trato de Argel;* but it is as the author of the immortal *Don Quixote* that his fame is sung throughout the world. This work is by no means a model of literature, nor does it show Cervantes at his best as a writer of prose; but the strong human interest that underlies its humor is the reason for its greatness. It is a masterpiece of unsurpassed invention, and is a work for all times and all nations. A great creative writer, but lacking the universal note of Cervantes, is his contemporary, Lope Felix de Vega Carpio (1562-1635). Lope was the creator of the modern drama. He was a prodigy of learning and inventiveness, and was the most voluminous writer of ancient and modern times. The great authors of other nations drew upon the treasures of his art; his plays have been treated as models by all later Spanish writers, and his influence has been unique. As a poet he achieved fame, though not greatness. Many of his carols (*villancicos*) treating of the childhood of Jesus are very beautiful. The miscellaneous works of this versatile writer fill more than twenty large volumes. The most eminent of the minor poets of this epoch was Góngora (1561-1627), whose earlier verse is marked by fine workmanship and rare lyrical melody. But he was the founder of a school which is known as *culturanismo*, and Gongorism soon become synonymous for all that savors of bad taste, affectation, and euphemism. A more widely gifted writer is Quevedo (1580-1645), who attained some measure of success in almost every branch of literature, though never reaching the first rank in any one of them. The chief writers of the so-called Aragonese school were the brothers Lupercio and Leonardo de Argensola, whose works are scholarly but artificial. Less exclusively classical is Manuel de Villegas, an Anacreontic poet.

Turning to the historians, a new epoch is marked by the production of the *Anales de la Corona de Aragon* by the learned Gerónimo de Zurita. This is the most trustworthy authority on the period, though it is hardly distinguished as literature. Very different is the *History of Spain* by the greatest of Spanish historians, Juan de Mariana. It bears the defects and limitations of the age, but its prose is above criticism.

Calderón (1600-1681) is the greatest Spanish dramatist by reason of his being the greatest poet who espoused the drama. He created no new forms but developed the seeds sown by Lope. His published works consist of about 120 plays and 80 autos or mystery-plays, besides some light interludes and occasional verses. His best known plays are the *Principe Constante*, *El Pintor de su Deshonra*, and the two philosophical dramas *La Vida es Sueño* and *El Mágico Prodigioso*. As a writer of autos he stands supreme. He is not an universal dramatist, but the most representative Spaniard of the seventeenth century. A notable dramatist of the Golden Age is Gabriel Téllez, better known by his pseudonym "Tirso de Molina" (1571-1648). His most famous play is the *Burlador de Sevilla*, which is based upon the legend of Don Juan. The religious side of the Spanish character is represented in *El Condenado por Desconfiado*, while Tirso's mastery in lighter comedy is shown in his *El Vengonzoso en Palacio*. His fame, like Lope's, is growing every day. During a period of one hundred years the fertility of the dramatic authors is unparalleled. Plays dealing with the problems of human life or studies in human character are foreign to the Spanish genius, but the form in which Spain excels is the play depending for interest entirely on its plot, and the masterly combinations of stock characters. The "sword and cloak" plays were dear to the hearts of the people. The period of Spanish literary glory coincided, as in other countries, with the most brilliant epoch of military glory and national activity. But when reverses came, Spanish literature decayed. The old ideals were still clung to, but they were no longer in keeping with the spirit of the times.

The best attempt at formal epic in Spanish is the *Araucana* of Ercilla, written during the campaign against the Araucanian Indians in Chile. There is little in it however that merits the name of poetry.

With the succession of the Bourbons, French influences became dominant in Spain. The old traditions were dead, and the ground was cleared for fresh developments. When Spain awoke from her lethargy, the eighteenth century was dead, the old literature was gone, the foreign influences had not taken root, and the vacant field was about to be occupied by the romantic

school and the modern novelist. During the age of the Bourbons, one of the foremost figures was the poet Luzán, whose *Poética* sets out his destructive criticism. Other reformers were Feijoo, Sarmiento, Isla, and Meléndez. Isla was the greatest prose writer of his time.

Under the unifying influence of the French wars Spanish literature responded to the renewed activities of the nation. During the struggle for independence, the verses of Manuel José Quintana (1772-1857) stirred the depths of patriotism. Yet even his *Call to Arms against the French* is written in the French classical style, and is Spanish only in sentiment. The classical poets of the early years of the nineteenth century number many other names of minor rank. The two chief poets of the Romantic school are the Duque de Rivas (1791-1865), who wrote *Al Faro de Malta* and *El Moro Expósito*, and José de Espronceda (1810-1842), the greatest Spanish poet of the last century. Espronceda modeled his verse on that of Byron, and was the hero of his own writings. His famous ode *To Jarifa*, his fragmentary *Diablo Mundo*, and his patriotic odes *A la Patria* and *Al Dos de Mayo*, are the most notable of his compositions. His successor, Zorrilla (1817-1893), is more widely known by his plays, *Don Juan Tenorio*, *El Zapatero y el Rey* and *Traidor, Inconfeso, y Mártir*. Among his more prominent contemporaries may be noted A. G. Gutierrez, the author of *El Trovador;* J. E. Hartzenbusch, who wrote the popular play, *Amantes de Teruel;* Manuel Tamayo y Baus, whose best and most ambitious play is *Un drama nuevo* (1867); and Gustavo Becquer (1836-1870), who is represented by three volumes of prose legends and *Rimas*. Some of the latter are beautiful and full of pathos.

Spain has not contributed much to modern philosophy; but her theologians have always been of good repute. Two names suggest themselves: Don Jaime Balmés, author of the famous *Cartas á un Escéptico*, and Don Juan Donoso Cortes, whose most celebrated work is *An Essay upon Catholicism, Liberalism, and Socialism*. One of the most brilliant masters of prose is Mariano José de Larra (1809-1837). An essayist of somewhat the same stamp is Serafín Estébañez Calderôn (1799-1867); but more popular is Mesonero Romanos, author of *Escenas Matritenses*. Cecilia Böhl von Faber, better known by her pseudonym, "Fernán Caballero" (1796-1877), is the writer of *La Gaviota*, a novel many times translated.

Of more recent writers, the most eminent are Campoamor, who devised a new poetic *genre* under the name of *doloras, humoradas*, or *pequeños poemas;* Valera, whose *Pepita Jiménez* marks the renaissance of the Spanish novel; Pereda and Galdós, the novelists; Alas ("Clarin"), the critic and writer of one of the best modern novels, *La Regenta;* Emilia Pardo Bazán (b. 1851), the best authoress of the century; and the orator Castelar, who wrote an Italian story called *La Hermana de la Caridad*. The best of the modern dramatists is José Echegaray (b. 1832), who wrote *La Esposa del Vengador* and *O Locura ó Santidad*. The political poet, Gaspar Nuñez de Arce, the Cuban poetess Doña Gertrudis de Avallaneda, and the eminent critic, Marcelino Menendez y Pelayo (b. 1856), author of the remarkable *Historia de las Ideas estéticas en España*, are the last names that call for special mention.

The most exhaustive survey of the subject will be found in George Ticknor's great *History of Spanish Literature*, first published at Boston in 1849. This may also be read in the Castilian version of Pascual de Gayangos and Enrique de Vedia (1851-1856), or in the German of Nikolaus Heinrich Julius (Leipzig 1852).

PORTUGUESE LITERATURE.

The Portuguese language and literature had their birth in the same era as the kingdom. There is no great Portuguese epic like the *Cid*. The earliest monuments we possess are fragments of the poems of Hermiguez and Egaz Moniz, two knights of Alfonso I. These uncouth ballads are barely distinguishable as Portuguese. For the next two centuries such poetry as existed was imbued with the Provençal spirit, due to the troubadours and jongleurs of Provence, who flooded the peninsula with their minstrelsy. Macias, known as El Enamorado, Cristovão Falcão, João de Menezes, and the more eminent Bernardin Ribeyro, are the first Portuguese poets of any importance. These writers flourished in the fifteenth century, by which time the language began to assume the characteristics of modern Portuguese, and pastoral poetry laid its hold upon the affections of the people. Ribeyro has also left us a fragment of a prose romance entitled *Menina e Moça*. At the beginning of the sixteenth century the wealth and greatness of the nation had reached their zenith, and at this opportune moment appeared Sá de Miranda to stamp his genius on the poetry of his country. Miranda (1495-1558) laid the foundations of a national literature, and gave to poetry a nobler aim and a wider sympathy. Much of his best work is in the Castilian tongue, but his Portuguese writings consist of eclogues, sonnets, epistles, and two comedies. Of these, his epistles, written in flowing verse, are perhaps his most important contribution to literature. His influence was very marked, and, having rescued the national literature almost from barbarism, he was esteemed and imitated by a host of writers. Foremost among these was Antonio Ferreira (1528-1569), who rivals his master in the mark which he has left on the literature of his country. His style is more classical and more polished, and he wrote no single line except in Portuguese. His epistles and odes have won for him the title of the Portuguese Horace. His greatest work, and also the best tragedy in the Portuguese tongue, is *Castro*, based on the tragic history of the Lady Inez de Castro. These two great poets ushered in the most glorious period of Portuguese literature, an age which gave birth to the poets Pedro de Andrade Caminha, Diego Bernardes, Rodriguez de Castro, and Lobo de Soropita, and which culminated in the *Lusiad* of Camoëns.

The genius of Camoëns (1525-1580) looms large in his country's literature, so much so that the two great names, Miranda and Ferreira—the Chaucer and Dryden of Portugal—are almost overlooked even by their countrymen. His great masterpiece, the *Lusiad* (called by the Portuguese *Os Lusiadas*, or the *Lusitanians*), is a magnifi-

cent conception inspired by a lofty patriotism. It recounts the conquests in the Indies and the glory of the Portuguese arms and achievements. This famous epic is almost the only specimen of Portuguese poetry known outside the kingdom. Camoëns wrote a number of sonnets, canzoni, and eclogues, eloquent of the sorrow and melancholy of his life. One of his most noted contemporaries was Gil Vicente, a dramatic author, who may be considered the founder of the Spanish theater, in that he served as a model for Lope de Vega and Calderon. The rage for pastoral compositions reached its height in the time of Rodriguez Lobo, the author of a book on philosophy, besides pastoral romances and fugitive poems. His *Winter Nights* greatly influenced the writers of Portuguese prose, and its Ciceronian style was freely imitated. During the same period flourished Jeronymo Cortereal, who wrote a ponderous epic on the misfortunes of the celebrated Manuel de Sousa Sepulveda. Two other specimens of the Portuguese epic must be noted: the *Ulysses* of Castro, and the *Malacca Conquistada* of Francisco de Sa y Menesez.

The Augustan age saw the beginnings of a new branch of Portuguese literature. The historians vied with the poets in recounting the exploits and conquests of their countrymen. Foremost among them is John de Barros (1496-1571), author of the monumental work, *Asia Portugueza*, and one of the founders of Portuguese prose. His history was continued by Conto. Other noted historians are Castenheda and Bocarro, who dealt with the Portuguese conquests in India; Affonso d'Albuquerque, author of a series of *Commentaries;* Bernardo de Brito (1570-1617), whose reputation rests on his *Monarchia Lusitana*, an incomplete history of Portugal "from the creation of the world" to the rise of the monarchy; Osorio, Bishop of Sylvez (1506-1580), the historian of the troublous reign of King Emanuel. The most voluminous writer of this epoch was Manuel de Faria. He wrote largely in Castilian, but in his native writings he has won distinction by his *Portuguese Europe*, and a number of sonnets and eclogues. His commentary upon Camoëns and his dissertations on the art of poetry established his reputation as a critic. During the national decline following the subjugation of Portugal by Philip II. of Spain, a number of lesser poets abounded, the most notable among them being Antonia Barbosa Bacellar (1610-1663), Andrada. Simão Torezão Coelho, Duarte Ribeiro de Macedo, and Sister Violante do Ceo. Bacellar was the first to devise the *saudade*, a sort of elegy combining love, remembrance, and regret. The eighteenth century opens with the name of Francisco Xavier de Menezes, Count of Ericeyra (1673-1744), a disciple of Boileau, whose *Art of Poetry* he had rendered into Portuguese verse. Ericeyra's most ambitious work is the *Henriquéide*, an epic poem relating the exploits of Henry of Burgundy (the founder of the Portuguese monarchy) against the Moors. Antonio Correa Garçao and the Countess de Vimieiro, author of the tragedy *Osnia*, did their best to revive a moribund drama. The most eminent of the early nineteenth century poets are Antonio Diniz da Cruz e Silva, J. A. da Cunha, and F. M. de Nascimento. The Romantic movement began with Garrett (1799-1854) and Herculano (1810-1877). The latter is more famous as a historian, his *History of Portugal to the End of the Reign of Alfonso III.*, and later, the *History of the Origins and Establishment of the Inquisition*, establishing his reputation as the leading historian of the Peninsula. An ultra-romantic school of poetry was started by Castilho (1800-1875), and included such lyric poets as João de Lemos (1819-1889), Soares de Passos (1826-1860), and Thomaz Rebeiro (1831-1901), author of the patriotic poem, *D. Jayme*. Belonging to no school, and a true son of the people, is João de Deus (1830-1895), one of the chief lyric poets of Portugal. His *Campo de Flores* is remarkable both for its spontaneity and simplicity, and contains a number of such exquisite gems as *A Vida* and *Rachel*. Four more poets call for mention, each of whom is distinguished by a weighty reflection and the influence of foreign models: Anthero de Quental (1842-1891), author of more than one hundred sonnets; Guerra Junqueiro, whose *Death of Don Juan* and *Patria* prove him a master of satire, while his quasi-philosophical *Os Simples* shows him to be a really great poet; Gomez Leal, who wrote the *Claridades do Sul;* and Antonio Nobre (1867-1900), whose lyrics created a sensation by their freshness and lofty inspiration. In comedy the two chief names in modern times are Fernando Caldeira (1841-1894), author of *A Mantilha da renda* and *A Madrugada*, and Gervasio Lobato (1850-1895), whose most popular plays are *O burro do Sr. Alcaide*, *O Valete de Copas*, and *O testamento da Velha*. The novel shares with poetry the leading place in modern Portuguese literature, and three at least of their novelists are of first rank, viz., Camillo Castello Branco (1825-1890), Gomes Coelho ("Julio Diniz"), and Eça de Queiroz (1843-1900), the greatest of the three, and the founder of the Naturalist school in Portugal. The best novels of Queiroz are *Cousin Basil*, *Os Maias*, *The Relic*, and *The City and the Mountains*. As a creator of characters he can hold his own with any European novelist of his day. The leading art critic of recent years is Ramalho Ortigão, who will be remembered chiefly for his *Farpas*, a series of satirical sketches of society written in collaboration with Queiroz. Nor must we overlook the philosophic *Historia de Portugal* and *Portugal Contemporaneo* of the gifted writer, Oliviera Martins (1845-1894). It will be seen that, the drama alone excepted, Portuguese literature during the last century reaches a high level of excellence. That their more eminent writers are not more widely known and appreciated is due to the language being little understood by foreigners generally.

FRENCH LITERATURE.

The earliest literary monument of the French language is found in the Strassburg Oaths of 842, famous alike in history and literature. Few manuscripts, however, have come down to us from before the twelfth century. The form of the language and the trend of the literature were largely determined by two events: the conquest of Normandy by Philip Augustus, and the Crusades which terminated under his grandson. During the twelfth and thirteenth centuries almost every form of literature was attempted

Since poetry invariably develops before prose in the literature of any nation (for the imagination of infancy precedes the growth of reason), we find *cantilènes*—short historical ballads—and epic poems in abundance. The French Epic is of German origin, the Teuton spirit in a Romance form; and like that of all other nations it had its birth in native minstrelsy. The *Chansons de Gestes*, so called from the *Gestes* or heroic families of early France, were sung by the *Trouvères* and *Jongleurs* to the accompaniment of the *veille*. The *Chanson de Roland*, the MS. of which is in the Bodleian Library, Oxford, is the most famous of these poems, and represents the first real development of French literature. To France we owe the origin of the epic of Arthur, the satire of Reynard the Fox, and the allegory of the Rose. The epic and romance were not so popular in the south, and the lyrics of the troubadours are the chief feature of Provençal poetry. Blondel de Nesle (known by his legendary connection with Richard I.) and Thibaut of Navarre were the most noted lyrists of the Provençal school. The drama, too, was begun in all its varieties, tragedy, comedy, and opera; while history, vernacular homilies, and satire were equally prolific. The oldest extant historical work on contemporary events is Ambroise's *L'Estoire de la Guerre Sainte*, which relates to the Third Crusade (1189-1192). The Fourth Crusade is dealt with in the famous memoirs of Villehardouin (about 1160-1213), the first author of distinction who used French prose as a medium of expression. His *Conquête de Constantinople* has been called a *chanson de geste* in prose. What Villehardouin is to the twelfth century *Jean de Joinville* (1224?-1317) is to the thirteenth and Froissart to the fourteenth. Joinville, in 1309, produced his *Histoire de Saint Louis*, in which he gives an account of the things he had "oralement veues et oyes." During the reign of St. Louis the first French translation of the whole Bible was written at the University of Paris. This became the standard French version of the Scriptures.

The fourteenth century saw a change come over the spirit of the literature; romance was checked, and the *chansons de gestes* were converted into prose. Didactic literature dethroned the tales of chivalry and adventure. Few writers need be noted: Alain Chartier (1386-1440), poet and historian, whose best work is his *Quadriloge*, but who is known to modern readers by the story of Margaret of Scotland's Kiss; Christine de Pisan (1363-1431), whose chief works are her *Cents Ballades*, and the *Livre du chemin de longue étude* directed against the *Roman de la Rose;* Eustache Deschamps (1328-1415), the most prolific poet of his time; Charles d'Orleans (1391-1465), the last of the trouvères, and an admirable poet; Villon (1431-1485), the most important figure of French literature before the Renaissance, and whose poems foreshadow the modern poetry; and Froissart (1335-1410), the celebrated chronicler and lyrist, whose *Chroniques* deal with the history not only of France but of England, Italy, Germany, Spain, and Portugal. Froissart has been well named "the knight-errant of history." The fifteenth century was more remarkable for its prose than its poetry, and Comines (1447-1511) was its most illustrious writer. In reading his *Mémoires* one is struck with the progress the language has made since Froissart. The French Chronicle before Comines was practically only gossip, with random gleams of genius. No abstruse or political work of importance was attempted in French prose before the beginning of the sixteenth century; for the vernacular, though rich in volume, was not flexible or precise enough for serious prose. Latin had stunted the expansion of the language, and a critical spirit had not as yet shown itself. As a molder of French prose, Antoine de la Salle (1398-1462), the chief writer of fiction before Rabelais, deserves to rank with the great chroniclers. Poetry was at a low ebb, and the verses of Crétin and Coquillart may be taken as typical of the fifteenth century.

The sixteenth century witnessed the grand upheaval of the Renaissance and the Reformation, and in no country was the literary result more striking than in France. No later period can show a finer array of poets and prose writers: Calvin, St. Francis de Sales, Montaigne, Du Vair, Bodin, D'Aubigné, Brantôme, Pasquier, Rabelais, Des Periers, Herberay des Essarts, Amyot, Garnier, Marot, Ronsard and the rest of the Pléiade, and the polished satirist Regnier. These created a language and a style able to give expression to their genius. Calvin's *Institution de la religion chrétienne* (1540) is the first really great composition in argumentative French prose. The Pléiade, whose two brightest stars were Ronsard and Du Bellay, revolutionized the language; and in spite of their classical eccentricities they laid the foundations of modern French. The dramatic works of Etienne Jodelle (1532-1573) mark an epoch in the history of the drama. With his *Cléopâtre* he founded modern French tragedy, and modern comedy with his *Eugène*. Literature, in fact, became organized. But the pride of the early Renaissance is Rabelais, whose *Gargantua and Pantagruel* is the work of a great creative mind, and a master of literature. Montaigne, whose *Essays* have never lost their popularity, was a writer of the purest French, and his work is of supreme importance in the history of French prose.

The seventeenth century is the golden era of the French drama and French prose; but, excluding the dramatists, there is not a single poet who belongs to the first rank. Malherbe and Boileau are the two most prominent poets of the latter half of the century, the former being a radical reformer of the language and literature. The most illustrious group of the "Grand Siècle" of Louis XIV. consisted of Descartes, Corneille, Pascal, St. Evremond, La Rochefoucauld, Bossuet, Madame de Sévigné, La Fontaine, and Molière; and these have scarcely a rival in prose, or in the measured verse, half poetry, half prose, which the dramatists affected. In 1635 a great service was rendered to literature by the founding of the *Académie française* by Richelieu. "Le grand Corneille" (1606-1684) is the greatest tragic dramatist of France in the classical style, and as a writer of dramatic verse his place is amongst the giants of the world's literature. The *Cid* and the *Menteur* are respectively the first examples of French tragedy and comedy, which can be termed modern. His masterpieces, *Horace, Cinna, Polyeucte* (the greatest of all Christian tragedies), and *Rodogune* (perhaps the finest of his works), strictly conform to the classical model. Molière (1622-1673) stands foremost in the history of French comedy. He

alone amongst dramatists recognized the value of the stage as a lay pulpit, and his wit enshrined a wholesome moral. The heights of his genius are seen in *Tartufe* and the *Misanthrope;* while his influence on all subsequent writers of comedy is most marked. The tragic masterpieces of Racine (1639-1699) reveal a perfection of workmanship never before attained. The purity and melody of his style and his masterly skill are seen at their best in his *Andromaque* and *Athalie.* But like Molière he ignores the complexity of human character, and his dramatis personæ might well be labeled with some particular type or trait—puppets of the stage and not creatures of the world. This distinguishes the classical dramas from the plays of Shakespeare, and is largely due to the rigid adherence to the Aristotelian unities. No century surpasses the seventeenth in the beauty and precision of its prose. As finished gems, what can excel a peroration of Massillon, a letter of Madame de Sévigné, a maxim of La Rochefoucauld, a *caractère* of La Bruyère, a *pensée* of Pascal, an *oraison* of Bossuet, when each writer is seen at the best? But the first complete model for classical prose was supplied by the *Discours de la Méthode* of Descartes, which was not only an epoch-making book of philosophy but also of French style. The essays of Jean Guez de Balzac (1594-1655) and the *Recherche de la Vérité* of the philosopher Malebranche (1631-1715) were remarkable contributions to French literature. The most popular narrative of France, the *Télémaque* of Fénelon, was produced in this period; so too were the writings of the great wit, St. Evremond, which influenced Voltaire and through him all later literature.

The eighteenth century was dominated by the Academy, to which every French author strove to belong. The effect at first was salutary, but in time the Academy acted as a check on spontaneous genius; hence the eighteenth century is not eminent in belles lettres, but only in serious branches of study. The most important French literary production was the *Encyclopédie* edited by Diderot. Voltaire (1694-1778), one of its contributors, won fame in almost every branch of letters. As a dramatist his three best works are *Zaïre, Mérope,* and *Tancrède.* As a writer of short tales he excels, and in the use of satire and *persiflage* he is a past master. Many of his phrases are now household words. As a historian his best work is the *Siècle de Louis Quatorze.* Chénier (1762-1794) is the greatest poet of the century; while Crébillon the Elder, Beaumarchais (author of the *Barbier de Séville* and the *Mariage de Figaro*), and Lesage are its most noted dramatists. Diderot the encyclopædist was not at his best in his plays. The first and greatest novelist of the century is Lesage, whose *Gil Blas,* a work which resembles Fielding, is by reason of its style and language one of the classics of French literature. Marivaux (1688-1763) may claim to have invented the novel without a purpose, aiming simply at amusement. Jean Jacques Rousseau (1712-1778), the celebrated novelist and *philosophe,* became the teacher of Europe, and was a greater force in life, letters, and education than any other writer of the age. His *Emile* (whose sub-title is *L'Education*) and *La Nouvelle Héloïse,* though not perfect as novels, have had a mightier influence than any other novel in the world. The greatest man of letters of the eighteenth century was undoubtedly Montesquieu (1689-1755), a writer of greater depth and originality than Voltaire. His three chief works are the *Lettres Persanes,* the *Grandeur et Décadence des Romains,* and his masterpiece *Esprit des Lois.* A notable follower of Rousseau was Bernardin de St. Pierre, whose *Paul et Virginie* is now a well-known schoolbook. In philosophy we must note the names of Turgot, Condorcet, Volney, and Condillac, as well as the moralists Helvétius, Thomas, Vauvenargues, Chamfort, and Rivarol. Among the *philosophes* was an antitheistic school, whose opinions may be gathered from that remarkable book, the *Système de la Nature,* believed to be the work of Baron d'Holbach. The chief of the scientific writers is Buffon (1707-1788), whose great work is the *Histoire Naturelle,* a book of 36 volumes, written in an inflated style. Buffon is the author of the well-known phrase, "Le style c'est l'homme." Rouget de Lisle deserves mention for his one famous poem, the *Marseillaise* (1792).

The greatest name at the beginning of the nineteenth century is unquestionably Chateaubriand (1768-1848), whose literary influence can hardly be exaggerated, and who has justly been called "the father of the romantic movement." So charmed was Joubert (whose *Pensées* prove him the most illustrious successor of Pascal and Vauvenargues) with the brilliance of Chateaubriand's style, that he called him "l'enchanteur." Of his miscellaneous works the most remarkable are *Les Martyrs, René, Génie du Christianisme,* his *Itinéraire,* and his autobiography, *Mémoires d'Outre Tombe.* Madame de Staël (1766-1817) is an important figure during this epoch. Her principal novel is *Corinne,* but her greatest achievement is her book *De l'Allemagne.* Xavier de Maistre (1764-1852) is best known by his *Voyage autour de ma Chambre,* a model of French style. Courier (1772-1825) deserves mention for his unique Letters, which in his own words reveal "peu de matière et beaucoup d'art." Chief amongst the transitionists from the *philosophe* era to the new romantic and eclectic movements are Béranger, the song writer of the people; Lamartine, distinguished both in prose and verse; Lamennais, the gifted theologian and journalist; Cousin, the eclectic; Henri Beyle, who wrote under the name of De Stendhal; Nodier, and the two dramatists Soumet and Delavigne. The triumph of the literary revolution is centered in Victor Hugo (1802-1885), the king of modern French literature, foremost then and foremost still. In him all the romantic characteristics are embodied and expressed. The fine tragedy *Hernani,* that masterpiece in prose *Notre Dame de Paris,* his matchless odes and ballads, and that remarkable book *Les Quatre Vents de l'Esprit* all show the greatness of his genius. The seven other names which sum up the greatness of the romantic movement are Sainte-Beuve, the greatest of French critics; Dumas the Elder, the celebrated novelist and dramatist; Honoré de Balzac, a novelist of great originality, given to minute psychological analysis; George Sand (Lucile Aurore Dupin), a novelist of rare imagination and improvising power; Mérimée, a novelist of the first rank and a master of French prose; Théophile Gautier, poet, critic, and novelist, a master of the ornate style of modern

French; and, lastly, Alfred de Musset, the gifted poet, dramatist, and novelist. Three stars of lesser magnitude must be noted: Alfred de Vigny, an original thinker among poets, and a prose writer of some distinction; Auguste Barbier, eloquent in his vigorous satires, the *Iambes;* and Gérard de Nerval, a less known writer of poetic prose. The romantic was followed by the naturalistic movement, itself divided into the Impressionists (represented by the two Goncourts, Alphonse Daudet, and, in a sense, Pierre Loti) and the Realists (led by Flaubert, Zola, and Guy de Maupassant). The Realistic School abolished all conventions and sunk deep into the baser side of human character. Though the works of Zola contain an element of grandeur, it is a grandeur in which no Soul is immanent. A reactionary movement against this school was begun by Paul Bourget (1852-1936), aided by Brunetière, Lemaitre, and Anatole France.

Of the most recent poetry the "Parnassian School" is the most noteworthy. It was founded by L. Xavier de Ricard and Catulle Mendès. Its most prominent members are Sully-Prudhomme (a French Matthew Arnold) and François Coppée. Of names distinguished in other fields of literature, the most notable are Comte and Proudhon, constructive philosophers; Montalembert, Lacordaire, and Rénan, theological writers; the brothers Thierry, Guizot, Thiers, Michelet, Quinet, Tocqueville, and Taine—a band of the greater modern historians.

Lavedan perfected the analytical novel, while de Régnier, Jammes, and Alain Fournier developed a fine poetic fancy in prose, and Romain Rolland combined criticism with fiction. Collete, the wife of de Régnier, and Comtesse de Noailles all three wrote with charm and feminine insight. Symbolism had died out by 1910, but the World War stopped further progress, though novelists continued to analyze, reminisce, and weave in delightful pictures. Benoit, Chadbourne, and Bizet brought back adventure to fiction after 1915. Carco chose realism, while Maurois perfected a type of impressionism, Bloch seemed a new Balzac, Jules Romains founded a new poetic style, Montherland introduced new moral purpose, and Chartier a short perfect French essay.

GERMAN LITERATURE.

The history of German literature may conveniently be divided into three periods:—

I. Old High German Literature, 600-1100, from the rise of the Franks to the Crusades.

II. Middle High German Literature, 1100-1500, from the Crusades to the Reformation.

III. New High German Literature, 1500 to the present day.

1. The beginnings of the literature may be traced almost to the dawn of the Christian era, and although no remains have come down to us there are references to German poetry which was in existence during the first six centuries. The development of epic poetry from the old heroic songs was closely connected with the migration of the German tribes. The heroic period was succeeded by an age of culture and Christianity in which the whole tone of literature was revolutionized by the infusion of new ideals. In the fourth century Bishop Wulfila (or Ulfilas) made a translation of the Bible into Gothic. The oldest monument extant of Christian poetry is the *Wessobrunner Gebet,* a Saxon poem, written in the beginning of the ninth century. A copy of the pagan poem, *Hildebrandslied,* though of much earlier origin, has come down to us from the same period. A great impetus was given to the literature by Charlemagne, aided by his Anglo-Saxon adviser, Alcuin. The poems *Ludwigslied* and *Der Heliand* mark the transition from paganism to Christianity. The former was written by Otfried, who was the first to write in rhyme. He also wrote the sacred epic, *Krist.* The first German poetess was the nun Hroswitha von Gandersheim (920-968), who was also the first dramatist after the Romans. In the second half of the ninth century we trace the beginnings of prose, the first efforts being in the form of tales (*Märchen, Novelle, Schwänke*) and legends. In the tenth century Notker Labeo translated the psalms into German prose.

2. The hundred and fifty years from 1150 to 1300 are called the "erste Blütezeit"—the first Golden Age of German literature. The brilliancy of this period is due to four causes: (1) The influence of the Crusades; (2) the patronage of the Hohenstaufen dynasty; (3) the spirit of chivalry; and (4) the introduction of models from France. The language used was Middle High German The epic romances presented an idealized picture of the virtues of knighthood. The priest Konrad wrote the *Rolandslied* in imitation of the *Chanson de Roland;* another priest, Lamprecht, wrote the *Alexanderlied.* Greater than either of these was Heinrich von Veldeke, the first of the poets who may claim to rank as German trouvères. His great work was the *Eneit,* based on Vergil's *Aeneid.* The greatest production of the Middle Ages is the *Nibelungenlied,* an epos which embraces the hero-songs of the leading German tribes. These songs had been recited for generations by the wandering minstrels, to an accompaniment on the zither or the harp. The second national epic is the *Gudrunlied,* which embodies the legends of the North Sea. While the sagas of the minstrels formed the foundation of these two epics, the poetry of the Court was inspired largely by the legends of other nations. Chief amongst these were the Arthurian Legend, the Spanish Legend of the Holy Grail, the Classical Legends of the Trojan War, the deeds of Alexander the Great and Charlemagne. The greatest poet of this era is the Bavarian knight, Wolfram von Eschenbach, whose *Parzival* is a masterly conception. The greatest of his contemporaries is Gottfried von Strassburg, who died at the beginning of the thirteenth century. The age of chivalry was remarkable for its lyrics. Poets of this class were called Minnesänger because their theme was "Minne," or the ideal Love. The chief of these writers of Minnepoesie was Walther von der Vogelweide, who died in 1227. The lyrics of Ulrich von Lichtenstein rank next in order of merit. His *Frauendienst,* 1255, is the oldest German autobiographical work extant. As the national and courtly epic began to decay about the middle of the thirteenth century, narrative poetry became more general, and the longer romance gave place to the short tale. The chief didactic work of this period was Freidank's *Bescheidenheit,* a word which appears to have meant worldly wisdom, rather than "modesty"—its modern meaning.

The use of prose was encouraged by the *Sachsenspiegel* and the *Schwabenspiegel*, two great collections of local laws; but preaching did more to establish it. From 1300 to 1500 was a period of literary dearth. After the fall of the Hohenstaufen dynasty, the age of chivalry came to an end. Driven from the strongholds of princes and nobles, literature took refuge in the cities. Guilds of poetry were formed amongst the burghers, but there is hardly a "Meistersänger" worthy of note. Heinrich von Meissen, surnamed "Frauenlob," was the first of the Meistersingers. Lyricism found its expression in the popular ballads (*Volkslieder*). During this age of decadence, prose became the universal medium, and a plain narrative prose style began to be cultivated in the Chronicles. But there were no prose writers of distinction in this period of gloom; no Villehardouin or Joinville, no Boccaccio or Roger Bacon. Not till after the early Italian Renaissance and the culture of the Humanists had spread beyond the Alps, did the Germans rise to the need of universities to form a groundwork for their literature. The rise of the drama from the sacred plays was similar to its development in other European countries. Gradually the comic element increased, until in the fifteenth century the secular drama or comedy arose alongside of religious tragedy.

3. With the Reformation the Germans awoke from their lethargy; and Luther (1483-1546), the dominant figure in literature as in religion, placed his countrymen in the van of European progress. His translation of the Bible gave the nation for the first time a literary language. Luther is the greatest of German hymn writers, and led the way with that fine battle hymn, "Ein feste Burg ist unser Gott." Ulrich von Hutten (1488-1523), a writer of satirical poems and prose dialogues, was a prominent disciple of Luther's. Hans Sachs (1494-1576), the leading German poet of the sixteenth century, composed in all 6,048 poems, among them many excellent hymns. His best works are his *Shrove Tuesday Plays*. The greatest satirist of this epoch was Johann Fischart, who was also one of the best masters of diction. Jacob Ayrer, a writer of plays, is best remembered for his *Singspiele*, the parent of the opera. The Thirty Years War (1618-1648) paralyzed German literature, and religious lyrics alone survived amid the general decay. The beginnings of modern German poetry may be said to date from the publication of the critical *Buchlein von der deutschen Poeterei*, of Martin Opitz, 1624. Paul Fleming (1609-1640) is the only secular poet of the seventeenth century endowed with true genius. Opitz and his followers are called the First Silesian School of Poetry. Marking the transition from this to the Second Silesian School is Andreas Gryphius (1616-1664), who was the first German dramatist to divide his tragedies into five acts. During the greater part of the seventeenth century Germany produced few prose works of eminence, and the language became more and more corrupt. Grimmelshausen's romance *Simplicissimus*, 1659, is a masterpiece of its time; while the name of Christian Thomasius (1655-1728) is noteworthy in connection with the first German periodical. During this dismal period Germany gave birth to one of her most brilliant thinkers, the philosopher Leibnitz (1646-1716). Poetry is represented by the names of Wernicker, Günther, and Brockes, the first German poet who displayed acquaintance with English literature. With Frederick the Great came a revival of letters. Gottsched (1700-1766) did good work for German literature by his "Critical Art of Poetry" (*Kritische Dichtkunst*). The poet and fabulist, Gellert, is the most popular figure of these times. His most important work is *The Swedish Countess*, the first social novel in German literature. It was modeled on Richardson's *Pamela*. Haller, Hagedorn, and "Vater Gleim" deserve note as poets; but greater than these is Klopstock (1724-1803), who, under the influence of the English nature poets, created the modern German lyric. His *Messias*, a sacred epic, is his greatest achievement. Gessner (1730-1788) is best known by his *Idylls*, which, until the appearance of *Werther*, was the most popular book in Europe. Among prose writers Moses Mendelssohn, Nicolai, and Forster stand out among their contemporaries.

The foundations of the classical literature, which reached its zenith by the beginning of the nineteenth century, were chiefly laid by Klopstock, Wieland (1733-1813), and Lessing (1729-1781). Wieland stands somewhat apart from the writers of his time. He represents the Latin element in the literature, and his work helped to counterbalance the excessive nature worship of Rousseau, which later swept through Germany. His masterpiece is the romantic poem *Oberon*, which won the applause of Goethe. In a letter to Lavater, July 3, 1780, Goethe wrote: "Sein 'Oberon' wird so lang Poesie Poesie, Gold Gold, und Crystall Crystall bleiben wird, als ein Meisterstück poetischer Kunst geliebt und bewundert werden." Wieland was the first to popularize Shakespeare in Germany, and translated 22 of his plays, thus contributing to the development of the German drama, which was soon to burst forth into unrivaled splendor. Lessing was the founder of æsthetic criticism in Germany, and the pioneer of the modern German drama. Macaulay styles him "the first critic of Europe." The greatest of his critical writings is the *Laokoon*. Lessing is still a living influence, and unsurpassed as a master of style. His *Minna von Barnhelm*, 1767, is the first masterpiece of German comedy. The tragedy, *Emilia Galotti*, followed in 1772, and his third and greatest dramatic work, *Nathan der Weise*, in 1779. The Second Golden Age of German literature was now reaching its highest glory in every field of thought. A new and vigorous movement began in Germany known as the "Sturm und Drang" (a name adopted from one of Klinger's plays); and the watchword of its leading spirits was "Originality and genius." Herder (1744-1803) is the greatest intellectual force of this new epoch, and forms the link between Lessing and Goethe and Schiller. As a linguist and translator he stands alone. His best prose work is *Ideen zur Philosophie der Geschichte der Menschheit*. Goethe, to use his own words in reference to Shakespeare, "is not for an age but for all time." His name is enrolled amongst the foremost poets of all nations, and *Faust*, his masterpiece, will live as long as the German tongue. Goethe sprang into European fame with the publication of his *Werther*,

and soon afterwards joined the illustrious group at the court of Weimar. With Wieland, Herder, Goethe, and Schiller banded together, it was indeed a "Court of the Muses." Goethe's famous dramas *Iphigenie, Egmont, Torquato Tasso,* besides his immortal *Faust,* give him rank as the greatest of German dramatists; while his matchless lyrics prove him the foremost lyric poet of Germany. The range of his activity was extraordinary, but the main secret of his power was his combination of realism and idealism. Schiller (1759-1805) is a truly national poet, second only to Goethe. He is an idealist expressing his noble sentiments and ideas by means of his dramatic creations. *Don Carlos, Wallenstein, Die Jungfrau von Orleans, Maria Stuart,* and his masterpiece, *Wilhelm Tell,* reveal the greatness of his dramatic genius. His ballads are loved by every reader of the language.

The Romantic School which now arose left its influence on every branch of literature and science. The prophet of this school was Friedrich von Hardenberg, better known as Novalis (1772-1801); its critical leaders were the brothers Schlegel, and its most productive writer was Ludwig Tieck. Affected too by this wave of romanticism were the brothers Grimm, whose fairy tales are dear to every child; Alexander von Humboldt, the natural philosopher; and Jean Paul Richter (1763-1825), usually called "Jean Paul," a master of satire gifted with what Carlyle called a "vast World-Maelstrom of Humour." Richter's two best works are *Titan* and the unfinished *Flegeljahre.* He was a power in his generation, but his influence is on the wane. Among the contemporary poets must be named Bürger, whose *Lenore* and *Der wilde Jäger* are translated by Scott; Voss, best known for his poem *Luise;* the brothers Stolberg; Matthisson, Miller, and Claudius. The deepest current in the intellectual life of Germany during the nineteenth century was philosophical speculation. The eminent philosopher, Kant, was succeeded by Fichte, Schelling, and Hegel, and these in turn by Strauss, Feuerbach, and Schopenhauer. One of the most celebrated story writers of the Romantic School was E. T. Amadeus Hoffmann (1776-1822), whose *Die Serapions-Brüder* and *Nachtstücke* are characteristic of his weird imagination. Friedrich de la Motte-Fouqué (1777-1843) is remembered best by his well-known fairy tale *Undine.* One of the great lyrical poets of modern times is Chamisso (1781-1838), who also wrote the romance of *Peter Schlemihl.* The lyrics of Heine (1797-1856) are amongst the best in German literature, and his ballads are known in every home. Except Goethe, no other German poet achieves his effects by such simple means. Rückert (1788-1866) wrote a number of poems inspired by the Napoleonic wars; but a more picturesque figure is Theodor Körner (1791-1813), whose well-known battle songs and the drama *Zriny* show great promise. Patriotism likewise inspired Kleist (1777-1811), who wrote many lyrics and excellent short stories. His two great patriotic dramas are *Prinz Friedrich von Homburg* and the *Hermannsschlacht.* Platen, Arndt, and Max von Schenkendorf also stand among the greater poets of the period. The Swabian group of nature poets included Uhland (1787-1862), the writer of some of the most charming songs and ballads; Gustav Schwab; Justinus Kerner, who was of a more tragic cast; and Eduard Mörike. Of more recent poets Fallersleben (1798-1874), Freiligrath (1810-1876), Kinkel (1815-1882), and Giebel (1815-1884), are the most distinguished; while Hebbel and Karl Gutzkow are highly-gifted dramatists. The German novel has not kept pace with other departments of literature. Freytag, author of *Soll und Haben* ("Debit and Credit"), is one of the best German novelists. Hauff's *Lichtenstein,* Scheffel's *Ekkehard,* Dahn's *Kampf um Rom,* Ebers' *Homo sum,* Auerbach's *Tales of the Black Forest,* Spielhagen's *Problematische Naturen,* and Paul Heyse's *Die Kinder der Welt,* are amongst the best of modern German fiction. Heyse is a master of style, as is also Hermann Sudermann, the dramatist of the successful play, *Die Ehre.* Sudermann's two best novels are *Frau Sorge* and *Der Katzensteg.* The greatest modern humorist of Germany is Fritz Reuter, author of *Ut mine Stromtid;* while the most original dramatist is Hauptmann (born 1862). History rose to its zenith in Niebuhr, von Ranke, and Mommsen.

Friedrich W. Nietzsche (1844-1900) established the individualism that dominated later Germany. Even on the poets, like Arent, Falke, Rilke, Hart, and the Swiss Spitteler his influence was profound. Realism in prose gained new power in Fontane, Raabe, H. Seidel, Rosegger of Austria, and Meyer of Switzerland. Keller in Switzerland and Thomas Mann (b. 1875) perfected the short story, while three women, Gabriele Reuter, Clara Viebig, and Ricarda Huch, gave us some of the best fiction. Wasserman and Mann kept the novel at high level, but popular tendencies interfered. Fulda, Kaiser, Ernst, Werfel, Toller, with Schnitzler, Bahr, and von Hofmannsthal developed the drama. Expressionism and romanticism also flourished.

RUSSIAN LITERATURE.

The literature and the people of Russia stand apart from the Western European world. The great movements, from the Crusades to the Revolution, which left their mark on Western nations, did not arouse Russian literature from its lethargy. The epic age, beginning with the *bilinas* or heroic tales, continued till the opening of the nineteenth century. The *bilinas* (literally "songs of the past"), unlike the national epics of other nations, are an apotheosis of the laborer instead of the knight. Instead of an Arthur or a Roland, they glorify Mikula and Ilia, both heroes of the plow. The age of chivalry which succeeded this primitive era is known as the Kief cycle, and its central figure is Vladimir, who introduced Christianity into Russia; yet the heroic *mujik,* Ilias de Moron, the giant Cossack, is well to the fore. With the spread of Christianity the paladins disappeared, and the literature assumed a religious cast. Two Greek brothers, Cyril and Methodius, translated the Gospel into the Sclavonic tongue; and in the eleventh century epistles, sermons, and moral writings began to pour forth. Nestor the monk, who died in 1116, Nicephorus, and Cyril the Golden-Mouthed were the chief writers of the time. Nestor's *Chronicle* is the first book on Russian history ever written. The twelfth century produced the *Song of the Host of Igor,* a

mixture of pagan and Christian marvels, written to please the Russian nobles. The Tatar invasion in the thirteenth century checked the course of lay literature, and not till the fifteenth century did the oral tales really enter into the domain of literature. In 1564 the printing press was established in Moscow, and on the first of May *The Acts of the Apostles*, the first book printed in Russia, made its appearance. The first regular press and the first periodical (1705) were founded by Peter the Great, who gave a great impetus to the Russian language and literature. Peter revived the theater and established the academy. In his reign there arose the first Russian writer of note, Lomonosof, who refined and perfected the language for his successors. Till the middle of the eighteenth century, though many writers appeared, their works were chiefly of an utilitarian nature. Tatichtchev (1685-1750) produced a *History of Russia*, while the only poet of distinction was Kantémir, with whom modern Russian poetry practically begins.

Under the influence of the Empress Catherine letters made great progress. A literary Pleiad arose, which numbered such names as Von-Vizine, the first original Russian dramatist; Derzhavin, the official bard; Kheraskoff, the pseudo-classic author of the *Rusiada;* Sumarakov, the first dramatist whose plays were put upon the stage; and the poets Bogdanóvich and Petróv. Russian literature owes much to Catherine, for by her writings and her influence she familiarized her people with the best thought of Europe. Translations from the *Spectator*, the *Guardian*, and the *Tatler* had a salutary effect on Russian letters. In the eighteenth century we find hardly a trace of anything original; imitations of foreign models alone abound. Other writers worthy of mention are Princess Dolgoroukaïa (1713-1770), Prince Chakhofskoï (1705-1772), Joukovski (1786-1852), and the prose writers Nóvikov, Tatíshchev, Shcherbâtow, and Radíshchev. But during this epoch little seriousness was shown in literary pursuits, and prose naturally suffered more than poetry. The best records of the eighteenth century are found in the memoirs, for the restrictions of free speech gave an incentive to this class of literature, which was not originally intended for publication. Karamzin (1766-1826), the "Titus Livius of Russia," the historian and novelist, first freed the popular style from the fetters of a pseudo-classicism, and exercised a humanizing influence on Russian literature. His direct literary heirs were the poets Dmitriev and Oziérov. The fables of the satirist Krylov are stamped with his own personal genius, and have been translated into twenty-one languages.

With the name of Pouchkine (1799-1837) we enter upon the most glorious epoch in Russian literature. Pouchkine is a lyrist of the first rank. His chief works, *The Prisoner of the Caucasus*, *The Fountain of Baktchissaraï;* *The Gipsies, and Eugène Onièguine*, have won for him a European reputation. He was moreover a finished prose writer, and the author of a most interesting novel, *The Captain's Daughter*. The two poets who stand nearest to him are his contemporaries, Baratinski, whom Pouchkine called "our first elegiac poet," and Lermontoff, the Russian Byron, whose poems are the high-water mark of romanticism in Russia. Pouchkine, Lermontoff, and Tolstoy, each in his own way, have sung the regenerative virtue of the snow-capped Caucasus. The creator of the Russian novel, Gogol (1809-1852), put an end to romanticism with his masterpiece, *Dead Souls* (a kind of Russian *Don Quixote*), and established the school of modern realism. One of the foremost writers of this school is the novelist, Turguéniev (1818-1883), a finished artist whom Ernest Renan pronounced the incarnation of the Russian people. His best known works, *First Love*, *A Sportsman's Sketches*, and *A Lear of the Steppes* so filled Taine with enthusiasm that he regarded their author as one of the most perfect artists the world has seen since the days of the ancient Greeks. Of his rival, Gontcharov (author of *Oblomov*), the visionary Dostoïevski, the gifted propagandists Herzen and Chtchédrine, the novelist Pissemski (whose best novel is *A Thousand Souls*), the poet of freedom, Nékrassov, and the author of the *Family Chronicle*, Aksakov, we can merely find space for their names. The most famous Russian novelist, Tolstoy, was born in 1828. A nihilist and a mystic, he formulated the idea of a return to Nature, for which the way was already paved by Schopenhauer, and in his writings Russian naturalism would seem to have culminated. A less known, though remarkable novelist is Liéskov (1831-1895), author of *The Priests*, the first description in the national literature of the life of the orthodox clergy. Of the writers of a younger generation only Tchékhov seems to be known out of Russia. Garshin and Chekov gave Russia powerful short narratives. Pasternak led the futurists, Klyuchevsky introduced scientific history, Lenin and Trotsky were powerful orators, but the Bolsheviks drove many good authors into exile.

POLISH LITERATURE.

Compared with Russia and Servia, Poland is extremely poor in legendary poetry and national songs. The earliest specimen of the Polish tongue is the so-called Psalter of Queen Margaret, discovered in 1826 at the convent of St. Florian, and which was presumably written about the middle of the fourteenth century. A more famous monument is the ancient battle hymn, *Picsn, Boga Rodzica* (1408), addressed to the Virgin. This is supposed to have been written by St. Adalbert. The next extant monument is the Bible of Queen Sophia or *Bible of Szaroszpatak*. The introduction of Christianity into Poland did nothing to foster the native literature, for Latin was exclusively the organ of the new faith. Not till the sixteenth century, when Polish became the language of Sigismund's court and of polite society, did the national literature come into being. From Rey of Naglowic (1505-1569), who is the earliest poet of repute and who first fixed the idiom of the language, the poets of Poland follow in an unbroken line. Rey, who is a contemporary of the celebrated Pole, Copernicus, is best known by his didactic poem, *The Mirror of an Honest Man*. The period from 1548 to 1606 is called by Poles their Golden Age. To this era belong Grochowski, author of 32 Polish works; Miaskowski, the best religious poet; Zabczyc, a song-writer and satirist; Zbylitowski, a didactic poet; Bielski, author of the *Kronika Polska*, the first historical work in Polish; Szymonowicz and Zimorowicz.

writers of pastorals; and Kochanowski (1530-1584), called the prince of Polish poets, whose most popular work is his *Treny* or "Lamentations," and who is the author of the first regular play, *The Despatch of the Greek Ambassadors.*

From 1606 to 1674 is known as the macaronic period, during which the literature and language declined, owing to the pedantic and frivolous studies introduced by the Jesuits. The poets were for the most part mere rhymesters, and the only writers worthy of notice are Potocki, noted for his epigrams; Twardowski, a most prolific poet; Opalinski, a bitter satirist; and Kochowski, one of the best Polish lyrists.

The literature found a regenerator in the last Polish king, Stanislaus Poniatowski, a zealous patron of letters and education. In this second great period of the development of Polish literature French taste was all-dominant; and though the language was enriched, it lost much of its national character. The most celebrated poet was Bishop Krasicki (1735-1801), a keen satirist, who wrote an elaborate epic on *The War of Chocim.* His fame now rests chiefly on his comic tales and fables. Another bishop-poet, Naruszewicz, succeeded better as an historian, and his *History of the Polish Nation* stands out as one of the finest examples of Polish prose. His contemporary, Kniaznin, ranks with the best of his country's lyrists. The more conspicuous names of this era are that "gifted child of nature," Elizabetha Druzbacka, the poetess; Trembecki, a court poet, whose chief work is a contemplative poem called the *Zofiiowska;* Wenzyk, whose *Glinski* and the *Boleslav* are the finest tragedies in the language; Kropinski, best known by the tragedy of *Ludgarda;* Felinski, who wrote the historical tragedy of *Barbara Radziwill;* Godebski and Tropinski, writers of miscellaneous verse; Niemcewicz, author of the *Historical Lives of Poland;* and Tomaszewski, the bucolic epic poet.

With the appearance of Mickiewicz (1798-1855), a romantic movement was inaugurated, and Poland, which had remained untouched by mediæval romanticism, was swept by the newer thought of England and Germany. Mickiewicz eclipses all Polish poets. His longest poem, by many regarded as his masterpiece, is *Pan Tadeusz;* but he is also the author of many beautiful sonnets, such as *The Storm, Bakchiserai,* and *The Grave of the Countess Potocka.* The second great poet of the romantic school is Slowacki (1809-1849), who, influenced by the writings of Byron and Hugo, produced his famous pieces, *The Monk, Hugo,* and *Lambro Beniowski.* One of the most entertaining dramatists Poland has produced is Fredro (1793-1876), who has given us many excellent comedies, modeled on those of Molière. Of more recent writers, few names call for special mention. Brodzinski, who has translated the *Lay of the Last Minstrel,* is a truly national poet. His best known poem, *The Legionist,* is touched with real genius. A further development of romanticism was marked by the Ukraine School of poets, chief amongst whom are Malczewski, Goszczynski, and Zaleski. But none of these can aspire to the mantle of Mickiewicz. Two names in fiction have attained European rank, Kraszewski and Sienkiewicz; the latter especially coming into prominence in 1896 with his sensational *Quo Vadis?*

DUTCH LITERATURE.

No national hero inspired the earliest writers of the Netherlands: the literature was mainly nurtured in the lap of commerce. Dutch literature had its birth in the thirteenth century. The oldest prose monuments extant are the charters of the towns of Flanders and Zealand, 1249, 1251, and 1254; these are in Middle Dutch. A translation of the Old Testament was made about 1300, and there is a *Life of Jesus* written about the same time. No genuine folk-tales of Dutch antiquity have been bequeathed to us, but there are some interesting prose translations of the stories of Arthur and Charlemagne recited by the wandering *jongleurs.* The first original Dutch author was Jakob van Maerlant (1235?-1300?), whose *Flowers of Nature*—a collection of moral and satirical addresses—forms an epoch in Dutch literature. No longer was literature the handmaid of the classes, but gave expression to the prosperity and growing independence of the burghers. A Dutch version of *Reynard the Fox* was made about 1250 by Willem the Minstrel. The first lyrical writer was John I., Duke of Brabant; while the earliest collection of Dutch folk-songs was published in 1544. The fourteenth century opens with the famous rhymed chronicles, the *Brabantsche Yeesten,* of Jan van Brendale (1280-1365); but the most important work of this period is the *New Doctrine* by De Weert, which by the boldness of its phrase foreshadows the Reformation.

The chivalric spirit came once more into vogue about the middle of the fourteenth century; though it was foreign to the literary genius of the Hollanders, who from the first sought to express themselves in a homely and utilitarian manner. During the Bavarian period (1349-1433) very little original work was produced—Van Aken wrote the romance of *Heinric en Margriete;* while with Dirk Potter's *Der Minnen Loep,* the last traces of the chivalric element disappeared, and poetry was left to the school of Maerlant. As in most European countries the religious drama occupies a prominent place. The earliest existing relic is part of a *Limburg-Maestricht Passover Play* of about 1360. The latest Dutch miracle play is the *Mystery of the Holy Sacrament,* by one Smeken, and performed at Breda in 1500. Besides these theological dramas there were produced moralities known as *Abelespelen* and *Sotternieën,* and in these we find the first signs of that genius for low comedy which culminated in the dramas of Brederôo. Out of the various theatrical companies and the wandering poets or *sprekers* there arose the "Chambers of Rhetoric" (for poetry was then styled the "Art of Rhetoric"), and these literary guilds greatly flourished during the fifteenth and sixteenth centuries. Meanwhile the growth of the native literature was retarded by the fact that the greatest Dutch intellects had recourse to the Latin tongue. Erasmus, Grotius, Arminius, Lipsius, and Vossius are well-known names to students of history, but their writings are entirely in Latin.

Modern Dutch literature virtually begins with Anna Bijus, who stands out amid the rhetoricians and psalm-writers of the sixteenth century as a poet of true genius. In her the middle Dutch period terminates and modern Dutch begins. Marnix (1538-1598), the author of the

famous *Wilhelmuslied*, the national hymn of Dutch independence, is also the writer of an epoch-making prose work, the *Biencorf* or Beehive of the Church of Rome. His contemporary, Coornheert, is best known by his *Zedekunst*, a prose treatise on ethics. Spieghel and Visscher form the link between the sixteenth and seventeenth centuries, and stand at the threshold of the Dutch Renaissance. At a time when the republic of the United Provinces rose to the first rank among European nations, with Amsterdam as the center of all literary enterprise, we encounter the greatest names in Dutch literature—Hooft, Vondel, Cats, Huygens. The tragic and lyric poet Hooft (1581-1647) is the founder of native tragedy. He is even more celebrated as a prose writer, for his masterpiece, the *History of Holland*, gives him rank with the foremost of European historians. His influence on his native tongue cannot be overestimated. Vondel (1587-1679) is the greatest of all Dutch writers. His fame rests chiefly on his numerous tragedies, the best of which are *Gysbreght van Aemstel* and, the more exalted in conception, *Lucifer*. The two daughters of Visscher, Anna (1584-1651) and Tesselschade (1594-1649), won distinction by their poems, and many writers of their time gathered around them. Brederôo (1585-1618) is the greatest comic dramatist Holland has produced. His best work is *Jerolimo, the Spanish Brabanter*. He created no school, but is a solitary figure in the literature of his country. "Father" Cats (1577-1660), as his countrymen affectionately call him, was a voluminous writer of didactic and descriptive poems written in a prosaic style. Though always popular with the people, he has really had a baneful influence on the literary art of Holland. Huygens (1596-1687) was not great as a poet, though a consummate metrical artist. His most famous poem is *Batava Tempe*, written in praise of The Hague. Among the lyrists the chief name is Starter (an Englishman by birth), who wrote the exquisite *Friesche Lusthof*.

After 1687 the literature declined. The more noted names are those of Poot, a rustic poet of undoubted genius; Langendijk, Holland's only comic poet; Hoogvliet, the author of the poem *Abraham;* De Marre, one of the best writers of tragedy; the brothers Van Haren, two celebrated poets; and Heemskerk, whose *Batavian Arcadia* is the first original Dutch romance. Towards the end of the eighteenth century the turning point was reached when the ladies, E. B. Wolff and Agatha Dekken, began to collaborate. In 1782 appeared their first novel *Sara Burgerhart*, in imitation of Richardson. This was followed by *Willem Leevend*, 1785, and *Cornelia Wildschut* in 1792. The real creator of a new epoch was Willem Bilderdyk (1756-1831), the most impressive figure of his time. He excelled in every kind of poetry, except tragedy; his masterpiece is the unfinished epic, *De Ondergang der eerste Wereld*, of which his country is justly proud. In spite of Bilderdyk's opposition the new romantic movement made headway in Holland. Van Alphen (the children's poet), Feith, and Kinker are the chief poets of this school. The foremost prose writer of the nineteenth century is Van der Palm, an historian of decided genius. His greatest achievement was the translation of the Bible. No very great genius has arisen in any branch of letters since Bilderdyk and Van Alphen. Loosjes wrote an historical romance, *Charlotte van Bourbon*. Among more recent authors we may mention Tollens and Loots, the patriotic poets; Van Walré and Van Halmaal, dramatic poets of distinction; and Bogaers, the most prominent poet and romance writer of the time, author of the famous poem *Jochebed*, though more beautiful is his *Voyage of Heemskerk*, in which his genius attains its height.

Flemish literature came once more into existence with the independence of Belgium, and has produced three writers of note: the poet Ledeganck (1805-1847), the popular novelist Hendrik Conscience, and the gifted writer De Laet. The use of the French tongue by Flemish authors has, however, deprived the national literature of much that is meritorious.

SCANDINAVIAN LITERATURE.

From an intellectual standpoint the Scandinavian nations, which consist of the people of Denmark, Norway, Sweden, and Iceland, form a national unity imbued by the same spirit. Down to the Middle Ages they spoke the same tongue, and even to-day the differences between the three chief languages, Danish, Norwegian, and Swedish, are very slight. The development of Northern literature is one of the most striking phenomena in the history of the world. The poetry and the sagas of the North were inspired by the highest ideals, and gave utterance to the deepest thoughts of the Teutonic race. The early literature of the North divides itself into two great categories—(1) the Lays, usually called the Eddic Poetry, and (2) the Sagas or Prose Histories. There are two Eddas: *The Elder* or Sæmund's Edda, consisting of 39 poems, was collected from oral tradition in Iceland between 1050 and 1133; *The Younger* or Snorre's Edda is the work of different writers, both of prose and verse, and was doubtless intended as a handbook for Skalds. The Eddas embrace a number of semi-historical narratives, dealing with the lives and deeds of Norse heroes, chief of whom is Sigurd, the champion of the Volsungs, besides mythic poems remarkable for their range and depth of thought. The skaldic poetry extends back to prehistoric times, but not till the time of the Norwegian king, Harold Fairhair, at the end of the ninth century, can we name any skald with historical certainty. The two most famous poets of the reign of Harold—himself a skald—are Thjodolf of Hvin and Thorbjorn Hornklofe. Of greater renown is Eyvind Finnson, who celebrates King Hakon in one of the finest songs bequeathed to us—*Hakonar-mál*. This poem seems to have been modeled on the earlier *Eiriksmál*, which was chanted at the funeral of King Erik Bloodaxe (d. 952). The most famous Icelandic skalds, descendants of Norse emigrants, were Egil Skallagrimsson, a great warrior-poet who has left us three long *drapas* or songs of praise besides a number of songs; Kormak and Gunlaug Ormstunga, whose lives are told in sagas; Snorre Sturlason, the celebrated poet and historian, and his two nephews, Olaf Hvitaskald and Sturla Thordarson. Sturla was the last to compose drapas in honor of Norse kings. After the fourteenth century, when Christianity gradually made itself felt, the poetry assumed a

religious tone. The most noted of these early religious poems is *The Lily* by the monk Eystein, a poem which marks the close of the skaldic period and the beginning of the *Rima* or ballad. The saga is a kind of prose epic centering round a single figure or group of characters. The Sagas may be divided into three groups: (1) The Icelandic Sagas dealing with life and character in Iceland, e. g., *Njala*, *Gretla*, *Laxdaela*, the *Eyrbyggia*, and *Egil's Saga*, all works of great literary merit; (2) The Historic Sagas, e. g., the renowned *Heimskringla*, or "the Sagas of the Kings of Norway" to the year 1177, by Snorri Sturlason; (3) The Mythical or Romantic Sagas, e. g., The *Volsung* and the *Saga of Gunlaug Serpent-Tongue*.

After the union with Denmark, intellectual activity in Norway almost ceased. A few Norsemen with literary ambitions settled in Copenhagen, and their works became incorporated in Danish literature. Swedish letters, however, entered upon an independent course. Among the more eminent names are Saxo Grammaticus, whose *Chronicle of Denmark* is the greatest intellectual effort of Denmark in the Middle Ages; Messenius (1579-1637), whose chief work is the *Scondia Illustrata*, a history of Sweden partly in prose and partly in verse; the chancellor Axel Oxenstjerna (1583-1654), who began a history of Gustavus Adolphus; Olof Rudbeck the Elder (1630-1702), whose *Atlantika* tries to prove that Plato's Atlantis and Paradise were no other than Sweden; Georg Stjernhjelm (1598-1672), a great literary reformer, who, in his epic-didactic poem *Hercules* and other poetic works, laid the foundation of an artistic literature; Rydelius (1671-1738), the first great Swedish philosopher; Swedenborg (1688-1772), the mystic writer who founded the remarkable theosophical system which bears his name; Holberg (1684-1754), who wrote a number of comedies in the style of Molière, and whose influence was so great that he must be regarded as the founder of modern Danish literature; Ewald (1743-1781), one of the greatest lyric poets of Scandinavia, whose best work is *The Fishermen;* and Wessel (1742-1785), the witty satirist and the second great poet of this period. During the latter half of the seventeenth century Swedish poetry modeled itself chiefly on the pseudo-classical French, the transition between this period of imitation and the golden age of Swedish poetry being marked by the writings of Olof von Dalin (1708-1763), and Fru Hedvig Charlotta Nordenflycht (1718-1763). The first Swedish novelist was Jacob Henrik Mörk (1714-1763), whose great novels, *Adalrik och Göthilda* and *Thecla*, are amongst the best prose works of this era. Another novelist, Jacob Wallenberg (1746-1768), is still popular in Sweden by reason of his rollicking novel *Min Son pa Galejen*. This period produced many eminent men of science, the greatest of whom is Karl von Linné (1707-1778), "the king of botanists." Swedish poetry attained its highest glory in the reign of Gustav III., himself a man of great literary ability, and the founder of the national theater in 1782 and the Swedish Academy in 1786. The most famous poets of this Gustavian period are Kellgren, Karl Gustav af Leopold, J. D. Valerius, Lidner, Thorild, and the greatest of all, Karl Michael Bellman (1740-1795). Historiography in the first half of the nineteenth century claims three eminent names, Geijer, Strinnholm, and Fryxeli. The most widely known Swedish poet is Esaias Tegnér (1782-1846), the author of *Frithjof's Saga*, *Axel*, and a poem made famous by Longfellow's translation—*The Children of the Lord's Supper*. Of the romantic poets or Phosphorists (so called from their periodical, the *Phosphoros*), the greatest was Atterbom (1790-1855), and his disciples, Dahlgren, Börjesson, Julia Kristina Nyberg ("Euphrosyne"), and Grafström. In the field of fiction Sweden is to the fore, and is particularly rich in historical novels. Count Sparre, Zeipel, Kullberg, Crusenstolpe, and the Finlander Zachris Topelius, have each given us important historical novels. A writer well known in the United States, which she once visited, is Fredrika Bremer, who wrote an appreciative *Life in the New World*, besides the romances, *The President's Daughters*, *Nina*, *Home*, and *The Neighbors*. Somewhat like her in his appreciation of all the features of an everyday life is Wetterbergh ("Uncle Adam"), whose novels *Genre Pictures*, *The Four Signatures*, *The Core of Society*, etc., give us a vivid picture of Swedish life and customs. Two other novelists, both women, are worthy of note, Sofia Knorring, and Emilie Flygare-Carlen, both of whom have left faithful portrayals of popular life. The greatest poet that has ever used the Swedish tongue is Runeberg, the Finlander (1804-1877). His chief work, *Fänrik Stals sägner*, is a collection of masterpieces throbbing with intense patriotism, and has won for him the title of national poet, both of Finland and Sweden. His exquisite idyl, *The Elk-Hunters*, marks an epoch in Swedish literature on account of its minute realism. One of the foremost writers of modern times is Viktor Rydberg, whose historical romance, *The Last Athenian*, has been translated into several tongues.

During the first fifty years of last century Danish literature shone forth with a new splendor. Oehlenschläger (1779-1850) was the first to rouse the nation's interest in the treasures of the past, and he revived the skaldic heroes in a series of historic tragedies, *Earl Hakon*, *Baldur the Good*, *Palnatoke*, *Hagbarth and Signa*, the heroic romance of *Helge*, and the fine dramatic poem, *Aladdin*. The versatile Baggesen belongs to the opening years of the century. Both his prose and verse are marked by a graceful style. He has been called "the poet of the graces." In the field of the drama there are P. A. Heiberg, a writer of operettas and comedies; Hauch, a true romanticist and author of many successful plays; and Henrik Hertz (1798-1870), the father of the new comedy in Denmark. The study of antiquities was further developed by Müller, author of the critical *Sagabibliothek;* Petersen, Werlauff, K. F. Allen, and the Icelander, Finn Magnusson (1781-1846), who traced the discovery of New England by Bjorne in the tenth century. The chief name in natural science is Oersted (1771-1851), author of a brilliant work, *Aanden i Naturen* (The soul in Nature). A race of intellectual giants came to a close with four Danish poets, each eminent in his own line—Grundtvig, Bödtcher, Andersen, and Paludan-Müller. Grundtvig (1783-1872) is the people's poet and his spirited songs are the joy of the poor. His influence on the literature of his country has been

considerable. Bödtcher (1793-1874) is one of the most finished poets of the North. His finest poem is *The Meeting with Bacchus.* The world-famed Hans Christian Andersen (1805-1875) was one of the most versatile writers, but his *Fairy Tales* are the flower of his remarkable genius. Their charm and freshness are not equaled by his *Improvisatoren* and *The Story of My Life.* Paludan-Müller (1809-1876), the social satirist, has won fame by his great epic, *Adam Homo,* though his lyrical drama, *Kalanus,* possesses more cosmopolitan interest. The excellent critic, Georg Brandes, whose *Danske Digtere* (1877) is known to every Scandinavian student, says of *Adam Homo* that it is "a piece of Denmark, a piece of our history, a piece of living cloth cut out of the web of time."

It was not till Norway regained her independence in 1814 that her literature became distinct from the Danish. At first her poets sang with harsh and hearty note, but amongst these patriotic versifiers three men, who have been called the Trefoil, were much admired in their day—Schwach, Bjerregaard, and M. C. Hansen. Rising far above these is the noble figure of Wergeland (1808-1845), who aggressively advocated the building of a literature upon national history and traditions. His most ambitious work is the symbolic epic, *Creation, Man, and Messiah,* but *The English Pilot* is his last and greatest poem. Welhaven (1807-1873) maintained a contrary opinion, and did his utmost to introduce new canons of criticism from abroad. He has left behind him several fine lyrics, while his prose writings are the most brilliant in Norwegian literature. A book which has exercised a great influence on later poets is the *Norwegian Popular Tales,* by the joint authors Jörgen Moe and the gifted zoölogist, P. C. Asbjörnsen. We now pass to the greatest name among the poets of the new realistic school, Henrik Ibsen, who has risen higher and higher as an artist till he now ranks with the foremost writers of the nineteenth century. His most famous work is the Puritan opera of *Brand.* Of his many dramas none have excited so much controversy as *A Doll's House.* Ibsen is an original thinker and an unsparing satirist. To him literature is a mighty agency for the amelioration of the race. His great rival, Björnson, poet, novelist, and dramatist, is famous throughout Europe and America. Björnson's works are imbued with the life and thought of his native land, and he has achieved what to Wergeland was only a fond hope. Stimulated by Ibsen and Björnson, a vigorous school of novelists has arisen, the most distinguished writers being Jonas Lie and Kielland, whilst among minor novelists may be noted Magdalene Thoresen, Camilla Collett, Dilling, Glöersen, and Paulsen.

JAPANESE LITERATURE.

In reviewing the voluminous literature of the Japanese, three features are particularly noteworthy: (1) the prominence of women writers; (2) the lack of any great epic or didactic poem; and (3) the absence of any great dramatist or imposing figure of any kind in the whole twelve centuries of their literary history. From the earliest times literature was the pastime of the mikado and his courtiers, and took the form chiefly of poetry and the writing of diaries. There were few works of a popular nature. China supplied both the inspiration and the models, while India, through the humanizing energies of the Buddhist missionaries, left its impress on the rising literature. The oldest extant monument is the *Kojiki,* or "Record of Ancient Matters" (712); but, though containing a number of Japanese songs, its interest is more archæological than literary. Of a similar character, though of greater historical importance, is the *Nihongi,* or "Japanese Record," in which Chinese influence is very marked. The *Norito,* or Shinto liturgies, are written in prose containing many of the elements of Japanese poetry.

The poetry is very restricted in its scope and form. Love and wine, absent and lamented friends, the joys of home and life's uncertainty, and withal the manifold beauties of nature, these are the themes most favored by the poets. War and religion seem foreign to the native muse, nor do we meet with any political, philosophical, or satirical poems. The most ancient collection is the *Manyôshiu,* or "Collection of a Myriad Leaves," which was prepared at the beginning of the ninth century. This anthology covers a period of about 130 years, and contains more than 4,000 poems, of which the greater part are *Tanka,* or short stanzas of 31 syllables. Still better known is the *Hiaku-nin-is-shiu,* or "Collection of One Hundred Persons," each author being represented by a single poem. This was compiled about 1235 by a courtier named Sadaiye, and has been translated into English by F. V. Dickins.

The Chinese influence, which was so great in the tenth century that the development of the Japanese language and literature was left almost entirely to the ladies of the court, became even more pronounced during the Tokugawa-Shôgunate (1603-1867). This period was productive of many writings, more remarkable for their pedantry and extravagances than for their literary merit. Considerable attention was given to the geography of Japan, as well as to matters pertaining to art. The drama has never held the same place as in European countries, and no classic author has arisen. The plays are always of a popular character. Another large portion of the literature consists of romances and fairy stories. The foremost novelist in Japan is Kiokutei Bakin (1767-1848), whose most famous novel is *Hakkenden.* One of the greatest literary undertakings was the *Dai Nihonshi* in 240 books, prepared under the patronage of the celebrated Mitsukuni, daimio of Mito (1622-1700). This is a history of Japan from the reign of the first mikado, Jimmu Tennô, 660 B. C., to the abdication of Go Komatsu, 1413, and is written in a concise and polished style. This standard work was first printed in 1851.

The downfall of the Shôgunate in 1867 gave a decisive blow to Chinese influence. As in other departments of Japanese national life, European models were set up in place of the Chinese, and were studiously copied and adopted. A band of new writers came forward who popularized the life and institutions of Europe. Of these authors the most conspicuous was Fukuzawa, whose *Seiyô Jijô* ("Things European") was issued in 1866. Many English books were translated, and about 1872 a new impetus was given to the spread of European knowledge by

the rise of a magazine and newspaper press. The influence of Europe on Japanese literature proper dates from the translation of Lytton's *Ernest Maltravers* in 1879. Gradually a reaction set in against the high-flown style and the drawn-out stories of the older writers. The leader of this salutary movement was Tsuboüchi Yuzō, whose *Shōzetsu Shinsui* ("Spirit of Fiction") is a merciless attack on the methods of Bakin and his school. Bimyōsai, author of *Natsu Kadachi*, and the realistic novelist Kōyō, introduce the colloquial dialect, which differs very considerably from the literary language. The most popular and voluminous writer of the present day is "Rohan" (Kōda Nariyuki). Fiction holds a very prominent place in modern Japanese literature, and these are only a few names out of a host of writers.

ENGLISH LITERATURE.

I. Its Beginnings (600-1066).—The story of English literature, from its rise in a barbaric age to the splendor of its manhood, is one that has kept pace with the nation's progress, and reflects the growth and greatness of the Anglo-Saxon race. Though no prose has come down to us from before the reign of Ælfred, we have the remains of many of the earlier poems, written in that strong, unpolished tongue from which our language has been evolved. There is *Widsiδ*, the fargoer; *Deor's Complaint*—the earliest English lyric; *The Wanderer; The Seafarer; The Fates of Men; The Ruined City;* and that famous, though unfinished epic, *Beowulf*. These were the songs of prehistoric bards, who, like the rhapsodists of Homeric times, journeyed from court to court, chanting their wild lays of "battle and bale," and rousing their hearers with the stirring minstrelsy of the sea.

The introduction of Christianity, and with it the use of the Latin tongue, bade fair to stifle all native song. But in virile Northumbria, the "scops" or gleemen clung to the language dear to their heart, and shaped the course of a national literature. It is remarkable that for long after the North became Christianized, the ritual of the church was in the native tongue. But a new spirit entered into English song, and the minstrel sang of the deeds and battles of the triumphant King of kings. The theme alone was changed; the form and the fervor remained the same. Cædmon, the aged Yorkshire bard, sang the story of Genesis and Exodus, and told of Christ and the life to come. These were the first really English poems, but their fame alone has survived. About the year 1650 Junius (Francis Dujon), a scholar of Amsterdam, published a manuscript which he believed was the work of Cædmon. The *Genesis* is worthy of the "Anglo-Saxon Milton," and is believed to have inspired that greatest of English epics—*Paradise Lost*. To another Northumbrian, Bæda, we owe the beginnings of English prose. Bæda's earlier writings were in Latin, and his *Historia ecclesiastica gentis Anglorum* is the chief authority for early England. By his scholarship he raised the standing of the English tongue, and translated into English *The Gospel of St. John*. The story of Bæda's death told by his pupil, Cuthbert, is the first record of English prose writing. Cynewulf, the greatest of the Northumbrian singers, flourished about a century after Cædmon, and was the first of the Old English poets who signed his verse. His name appears in runic letters in four of his religious poems: *Elene, The Crist, Juliana,* and *Fates of the Apostles*. Under King Ælfred, English became the language of letters, and the *English* or *Anglo-Saxon Chronicle* rose to the dignity of a national history. The *Chronicle* preserves for us that fine war poem, *The Song of Brunanburh* (937), as well as many songs of the time. Ælfred was truly the father of English prose; and as Yorkshire is the cradle of English verse, so is Winchester of our prose. The *Chronicle* lived on till the death of Stephen (1154); and at its close, we catch the last strains of Old English minstrelsy, and see in its quaint historical records the last traces of Old English prose.

II. From the Conquest to Elizabeth (1066-1558).—For a century and a half after the coming of the Normans, English literary history is a barren waste. French became the language of court and cloister; and English singers and writers became outcasts in their own land. But the tongue lived on among the masses and in time absorbed the Norman speech, until in the reign of Edward I. English literature was again supreme. The Normans brought with them their Chroniclers; and these Latin historians, the greatest of whom was William of Malmesbury, paved the way for historic romance and English story-telling. Geoffrey of Monmouth recounted the half-mythical tales of Arthur and Merlin, the stories immortalized in the *Idylls of the King*. From the Latin, Geoffrey's "History" (as he humorously styled it) was translated into French, and next put into English garb in Layamon's *Brut*. Layamon, who flourished about 1250, is the first English poet after the Norman Conquest. About 1300 story-telling gave rise to historical poems, and Robert of Gloucester penned his *Rhyming Chronicle* from Brutus to Edward I. Within the next 50 years French and Latin words streamed into our language, and the spirit of French romance pervaded the writings of those times. The reign of Edward III. not only saw the consolidation of the English people, but the fixing of the standard of the English tongue. The "King's English" became the language of court and letters. It was the East-Midland dialect that prevailed—the tongue of Oxford and Cambridge, of London and the heart of England. Langland's *Vision Concerning Piers Plowman* was, however, written in a dialect, and so was Wiclif's translation of the Scriptures. But both these works were meant to reach the hearts of the simple masses, and were given to them in words they well could understand. The Bible was read eagerly in every corner of the land, and did much to mold the style of mediæval writers.

The courtly Gower wrote little of value, and we turn from the dreariness of the *Confessio Amantis* (written in English verse) to Geoffrey Chaucer, "the morning star of English song." Chaucer wrote many poems which are colored by his sojourn first in France, and afterwards in Italy. Of such are the *Compleynt unto Pite, Troilus and Criseyde*, the *House of Fame*, and the *Legende of Good Women*. But it is as the author of the *Canterbury Tales* that Chaucer

is loved and remembered best. Like Dante, he wrote in his native tongue and made it at once the tongue of literature. A popular book in its day was that strange mixture of fact and fancy, the *Voiage and Travaile of Sir John Mandeville*. With the death of Chaucer in 1400, the brilliance of the dawn was followed by a century of almost total eclipse. Imitators of the great master arose, such as Thomas Hoccleve and John Lydgate; but these feeble rays only deepened the darkness. The coming of Caxton with his printing press worked a silent revolution in England's intellectual life. The first book printed in England was *The Game and Play of the Chesse*, 1474; but the first book bearing the imprint of William Caxton is *The Dictes and Sayings of the Philosophers*. Caxton was not only a printer, but an editor and translator; and, by his enterprise and zeal, saved the English of Chaucer from further degradation. His most important publication was *La Morte d'Arthur* of Sir Thomas Malory, the greatest masterpiece of prose before the revival of learning. What fixed our language once for all was Tyndale's *Translation of the New Testament* (1525). Tyndale's Bible, revised by Coverdale and issued as *Cromwell's Bible*, 1539, and in the following year as *Cranmer's Bible*, was set up in every church in England. After its revival in 1611, this same Bible was brought by the Puritan Fathers to New England, and fixed the standard of English in the New World. No book ever published has had so great and lasting an influence on the purity of language and the style of prose. The *English Prayer Book*, 1549-1552, edited by Cranmer, also gave balance to the English tongue. Not in Tyndale alone, but also around Sir Thomas More and Roger Ascham did the new learning center. More's most famous work is the *Utopia*, written in Latin, 1516, but afterwards translated by Ralph Robinson in 1551. More also wrote many works in English, his most valuable being the *Life of Richard III.* and the *Life of Edward V.* Ascham's most important works are the *Toxophilus*, or Lover of the Bow, and *The Scholemaster*, both written "in the English tung, for English men." The Renaissance in Italy was far reaching, and in the lyrics of Wyatt and Henry Howard, Earl of Surrey, we see the Italian sentiment wedded to the English tongue. Wyatt and Surrey gave us a new kind of poetry, and heralded the dawn of the Elizabethan splendor. The *Miscellany* of Richard Tottel, 1557, contains a number of poems by Wyatt, Surrey, and "Uncertain Authors." This is the first English anthology, and marks an epoch in the history of English verse.

III. The Golden Age (1558-1625).—The Elizabethan era presents a galaxy of genius far outshining the glory of any other age. Seldom have such giants of intellect been crowded into so short a span. The creative spirit overshadowed the nation: the poets burst forth into immortal song, and from the old Mysteries and Morality plays rose the drama to swell the triumph of the age. To merely name the poets, dramatists, and great prose writers of this period is to tell the brightest stars in the firmament of English literature. Spenser, Sidney, Shakespeare, Ben Jonson, Beaumont and Fletcher, Raleigh, Bacon,—what age has produced their like? At the threshold of this new era stand two well-known figures: Spenser, "the poets' poet," gazing dreamily backward, and Sidney, the "jewell of his times," living devotedly in the present; both destined to shape the age, of which they also were the product. Spenser's two greatest works, *The Shepheard's Calendar*, in 1579, and that exquisite allegory, the *Faerie Queene* (1590), delighted the England of his day as they have charmed true lovers of poetry ever since. Spenser sang of the ideal and the spiritual, and out of this subtle substance he wrote for England her first great ideal poem. His influence on all later poetry has been considerable. He was the originator of the English Spenserian stanza—a form of poetry only inferior in individual beauty to the sonnet, and which has been used with such telling effect by Thomson, Shelley, and Tennyson. The impress of Sidney on English poetry is very clear. Sir Philip Sidney, who died in the heyday of his fame, 1586, produced more artistic prose than any previous author; but it is as a writer of verse he excels, and his matchless sonnets by their influence created the greatest sonnet era in the history of English literature.

It was an age of action, and looked to the drama for an expression of national life. Shakespeare's was the master mind which seized the occasion and shaped it to his will. Whatever Shakespeare wrote he impressed with his titanic individuality. He settled forever the form of the English tongue and the English drama. Beginning in 1589 with *Love's Labour's Lost* (though the dates and order of his plays are not known with exactness), we can trace the growth of his skill and power in the *Comedy of Errors*, the *Two Gentlemen of Verona*, and the *Midsummer Night's Dream*. His dramas are preëminently human, and show us every side of human life, thought, and passion. He voiced the nation's patriotism in that grand series of historical plays, beginning with *Richard II.*, *Richard III.*, *Henry IV.*, and *King John*. In the *Merchant of Venice* the mastery over his art has become complete, and then follow his four great tragedies, *Hamlet*, *Othello*, *Macbeth*, and *King Lear*, each overtowering the one before in dramatic strength and grandeur of conception. In *King Lear* he reaches the summit of his tragic power. The grand development of his genius, from the first imperfect efforts to the sublime achievements of his riper years, has led some critics to believe that Lord Bacon, and not the man of humble birth, was the author of the plays; but such a conjecture is idle and baseless. His minor works include the poems, *Venus and Adonis*, and *Lucrece*, besides a collection of sonnets which reach the high-water mark of English poetry. Shakespeare is the greatest poet of our modern world. He is a literature in himself. Not only is his imagination complete, but all the elements of his many-sided strength are evenly adjusted. His is the one towering figure amid a band of giants; and this is as true to-day as 300 years ago. Such is Shakespeare, and such is his influence.

"Rare Ben Jonson" (1573-1637), the other leading dramatist of the Golden Age, stands out in striking contrast to Shakespeare. Jonson's was a mighty intellect, but void of passion. His

chief success was in comedy, his best works being *Every Man in His Humour* (1596), *The Alchemist*, *The Silent Woman*, and *Volpone the Fox*—the finest play he ever wrote. His tragedies are *Sejanus* and *Catiline*. Jonson's masques mark the beginning of the reaction against the imaginative school. They are material and not spiritual, and appeal to the intellect and not to the heart, thus sounding the first notes of the decadence of the drama. As a lyrist he excelled, and such songs as "Drink to me only with thine eyes" led the way for such as Herrick. Beaumont and Fletcher, the "twin stars," who ruled the drama after Shakespeare and Jonson had quit the stage, are striking examples of the creativeness of the times. Of their 52 collaborated plays the best known are *The Two Noble Kinsmen* (in which the hand of Shakespeare is evident), *The Maid's Tragedy*, and *Philaster*. "Beaumont," as Lowell has it, "contributed the artistic judgment and Fletcher the fine frenzy." Their plays, though brilliant, bore no message, and pandered to the coarseness of a declining age. That lovely pastoral, *The Faithful Shepherdess*, is by Fletcher alone, and anticipates the *Comus* of Milton. The Elizabethan age produced many distinguished dramatists whose fame has been eclipsed by the brilliance of the masters. The four most important writers in the earlier years are Peele, Greene, Kyd, and Marlowe. Marlowe (1564-1593) was the greatest of these, and may be said to have created the English tragic drama, laying the corner stone for the temple of Shakespeare. He wrote *Doctor Faustus* and *Edward II.*, and is the author of that beautiful lyric, "Come live with me and be my love." Other contemporaries of Shakespeare are Middleton, Marsden, Chapman, Heywood, and Dekker, whilst belonging more exclusively to the reign of James are Webster, Ford, and Massinger. The literary fame of the ill-fated Raleigh (1552-1618) rests not so much on his poems as on his *History of the World*, written during his 13 years' imprisonment in the Tower. This work shows an English historian for the first time looking beyond the British Isles.

The Renaissance left its influence on English prose. On the borderland between the old style and the new—between the strong, rugged writings of Tyndale and Latimer and the smoother periods of the later stylists — Raleigh and Hooker are the two chief figures. Hooker's *Laws of Ecclesiastical Polity* laid the foundations of moral and political science. The era of modern prose is ushered in by one predominant name—Francis Bacon (1561-1626). Unlike the writers of the Renaissance, who wrote only for the present, Bacon wrote for the future. His one desire was immortal fame; "a cosmopolitan philosopher writing for all ages and all nations." To this end he wrote principally in Latin, and even his English works he translated into Latin, "the universal language"; for he had no faith in the permanence of the English tongue. Of his Latin writings only the *Novum Organum* is of present importance (and this mainly academic); but his English works, especially the *Essays* and *The Advancement of Learning*, are read wherever the English language is known. The word "essay" was borrowed from Montaigne, and Bacon meant by it an attempt to record in compressed form his "dispersed meditations." He was not an investigating scientist, but a seer and idealist pointing the way. In the words of Macaulay, "he moved the intellects which have moved the world." Bacon was strangely lacking in passion. The cold rhetoric of his *Essay on Love* compared with the impassioned eloquence in Shakespeare's plays, reveals a striking contrast between these two vast intellects.

The crowning achievement of the age was the production of the Authorized Version of the Bible in English (1604). The King James Version—the greatest prose masterpiece of any age or language—fixes the standard of English prose for all time. No book in the history of the world has had so great an influence on life and letters. The Bible is the epic of the English-speaking race, and is woven into all that is noblest in our literature.

IV. The Age of Milton and Dryden (1625-1700). — Milton (1608-1674), though born in the reign of James, was really an Elizabethan, fired with the poetic zeal of the age just closed. The first 30 years of his life were productive of many fine lyrics, and amongst them those five immortal poems, *L'Allegro*, *Il Penseroso*, *Arcades*, *Comus*,—the last and greatest of English masques,—and *Lycidas*, in which shone the final rays of Elizabethan inspiration. For the next 20 years Milton laid aside the lyre, and hurled his fierce invective against the foes of the Commonwealth. Style was cast to the winds in the bitter fight for liberty; and, except his *Areopagitica* and the *Letter to Hartlib*, none of these prose writings command notice as literature. From 1660 to his death, Milton, blind and outlawed, turned once more to his art. Then grew that sublime, imperishable epic, *Paradise Lost*, magnificent in its conception, intensity, and unworldliness. This inspired poem, reflecting the loneliness of him "whose soul was like a star and dwelt apart," stands in our literature like some stately cathedral upon a heaven-rapt mount. Two other poems followed: *Paradise Regained* and *Samson Agonistes*, but both these fall short of the sublimity of his masterpiece. Milton is the greatest English poet save Shakespeare, and his strong personality is stamped on every line.

Of the many writers of this period, though dwarfed into insignificance by the side of Milton, may be mentioned those five religious poets of the "Caroline" period: Crashaw, Herbert, Vaughan, Wither, and Quarles, and the last of the lyric writers—Robert Herrick. Then there is Jeremy Taylor, "the Shakespeare of the pulpit"; Hobbes, author of that philosophic treatise, the *Leviathan;* and Sir Thomas Browne, who wrote *Religio Medici*. These are the three leading prose writers. In 1678 Bunyan published his famous *Pilgrim's Progress*, a book which draws its power almost entirely from the Bible, and which inspired a plenteous crop of religious allegorical works.

With the Restoration the old ideals were swept away; "the age of prose and reason," of artificiality and hypercriticism, was entered upon. Prose began to take the place of poetry; whilst poetry no longer voiced the emotions, but lent itself to satire and the play of intellect. A new interest in individual life gave birth to

numerous biographies. The new school began with the poems of Waller, Denham, and Cowley, the immediate precursors of that literary autocrat, whose iron rules cramped English poetry for over 100 years,—John Dryden.

Dryden (1631-1700) was the first leader of the new critical and didactic school. His first noted poem, the *Annus Mirabilis*, appeared in 1667, but not till he was 50 years of age did he produce that foremost of English satires, *Absalom and Achitophel*. This was the first great example of political verse, which grew so fierce and personal in the hands of Pope. It was a gallery of ruthless portraits, and was followed in 1682 by the *Medal*, a diatribe against Shaftesbury. The *Hind and Panther* (1687) is a religious satire aimed at the foes of the Church of Rome. In the same year he produced the *Song for St. Cecilia's Day*, and 10 years later, for the same occasion, he wrote that beautiful ode, *Alexander's Feast, or the Power of Music*. This Macaulay deems "his greatest work." First in poetry, so was he also first in prose. In his essays *On the Historical Poem*, on *Heroic Plays*, and on *Dramatic Poesy*, we catch the first notes of modern literary criticism. Dryden wrote several plays, but few survived his life. His best known are his tragedies, the *Indian Queen*, *All for Love*, and *Don Sebastian*, and his comedy, the *Spanish Friar*. It is in his satires, translations, allegories, and prologues that his fame will abide. His mastery over heroics is unequaled. His poetry is not of the highest kind; but in the sweep and variety of versification, in argument, in satire, in fiery spontaneity, and in declamatory splendor, Dryden stands supreme and unapproached.

The philosopher, John Locke (1632-1704), belongs to this period. His celebrated *Essay Concerning the Human Understanding* constitutes him the founder of the analytical philosophy of mind.

V. From Pope to Johnson (1700-1784).—On the death of Dryden, literature was in a state of stagnation. The comic drama, represented by Congreve, Cibber, Vanbrugh, and Farquhar, alone showed signs of vitality. For the first time in the history of English literature, poetry became wholly subordinated to prose. Not that verse was inactive; elegiac, didactic, and occasional poems poured forth in plenty; but the divine afflatus was gone, and poetry, dethroned from its high estate, became the wanton of the imagination. Literature was the instrument of party strife and unbridled slander. With the triumph of prose, the critic came into prominence; and, influenced by French writers of the period, introduced into England the Aristotelian criticism of imaginative literature. The effect on prose was healthy. Elegance, perspicuity, and brevity adorn the prose of the "Augustan Age" (a time-honored misnomer); a finished style was achieved by the leading writers, and prose became a worthy vehicle for the worthiest thoughts.

During this whole period no "great" poet arose to claim the mantle of the Elizabethan singers. Pope (1688-1744) stands first among his contemporaries. As a metrical artist he is unrivaled, and, until the rise of Wordsworth, his verse set the fashion for two generations. His *Essay on Criticism* appeared in 1711. The next year gave us the *Rape of the Lock*, a masterpiece of most exquisite beauty. The writings of the great French satirist, Boileau the "Lawgiver of Parnassus," had been closely studied by Pope and his school; but the *Rape of the Lock* marks the turning point of English deference to French ideals, and henceforward England gives models to the world at large. Pope was imitated in every country in Europe, while in England for 30 years he may be said to have represented the poetry of his time, unchallenged and supreme. His *Dunciad* was issued in 1728, and shortly afterward appeared his celebrated *Essay on Man*. This poem of the English classical school, though weak in philosophy, has enriched our daily speech by countless lines and phrases. "Dear Mat Prior's easy jingle," as Cowper somewhere speaks of it, adds sparkle to these early years. Gay, now best remembered by his *Fables*, contributed between 1713 and 1726 a sprightly flow of songs, epistles, and short pastorals. The first reaction against the dictatorship, begun by Dryden and continued by Pope, was made by Thomson, who is the true pioneer of the whole romantic movement which culminated in Wordsworth. Thomson's *Seasons* inaugurated a new intellectual era. After writing two or three tragedies, the chief of which is *Sophonisba*, 1730, he produced the *Castle of Indolence*, 1748, a poem in the Spenserian stanza. His masque, *Alfred*, 1760, is noteworthy as containing the British national song of *Rule Britannia*. To mention Thomas Gray is to at once recall his *Elegy Written in a Country Churchyard*, which Wolfe declared he would rather have written than take Quebec. This exquisite poem, and the Odes which every schoolboy knows, now rank with the classics of our language. Gray's influence on Europe was delayed but certain, and in the *Elegy* both Chateaubriand and Lamartine found inspiration. William Collins, whose *Ode to Evening* must be numbered with the best lyrics of the century, was, like Gray and Thomson, a herald of a fairer dawn. Goldsmith disdained these innovations, and reverted to the old didactic couplets of Pope. *The Traveller* and *The Deserted Village* are perfect examples of the descriptive poem in heroics. His verse has infinite grace and charm, but marks no forward step in the art of poetry. Goldsmith's best known comedies are *The Good Natur'd Man* and *She Stoops to Conquer*. The latter is one of the great comedies of the world. His *Vicar of Wakefield* will live as long as the English tongue. Turning once more to the prose writers, Defoe in 1719 gave us the first great English novel, *Robinson Crusoe*, written at the age of 58. The most conspicuous figure in the beginning of the eighteenth century is Jonathan Swift (1667-1745), born in Dublin of English parents. He was the greatest satirist of the age, and wielded a vast influence over the essayists and prose writers of the period. Swift created a school of rhetorical diatribe on its better side. His prose is characterized by great originality, simplicity, mordant wit, and savage satire. *The Tale of a Tub*, the *Battle of the Books*, and that sinister but inimitable masterpiece, *Gulliver's Travels*, are his best known works.

Bishop Berkeley, the greatest English thinker between Locke and Hume and a pure metaphy-

sician of the foremost rank, clothed his philosophy in prose of classic beauty. His famous dialogue of *Hylas and Philonous* was published in that celebrated year, 1713, when Pope, Swift, Addison, Steele, were all at the summit of their power and fame. One of the landmarks in the history of literature is the date, April 12, 1709, when Steele issued the first number of the *Tatler*. This, though not the first English newspaper, marked the creation of modern journalism. Addison joined forces with Steele, and on March 1, 1711 (two months after the collapse of the *Tatler*), the *Spectator* appeared, only to die an early death at the close of 1712. But during this short time the periodical essay was created. Steele began it and contributed 188 out of the 271 numbers of the *Tatler;* 42 were by Addison, 36 by both conjointly, and 3 by John Hughes (1677-1720), a minor writer, author of *The Siege of Damascus*. But in the *Spectator* the polished pen of Addison took the lead. Of the 555 numbers, Addison wrote 274, Steele 236, Hughes 19, and Pope 1 (*The Messiah*). Addison was a great master of style, and was one of the first English prose authors to aim deliberately at beauty of execution and purity of language. In this way his style is often superior to his matter. His share in perfecting our prose, and spreading culture amongst the middle classes of his time, was very considerable. Recent biographers incline to do greater justice to Steele at the expense of Addison; but these illustrious colleagues were the natural complement of each other, and we may love them both. In the 49th *Tatler* occurs that famous phrase of Steele's, where, speaking of Lady Elizabeth Hastings, he says that "to love her is a liberal education."

The period was rich in letter-writers. Walpole, Gray, and Chesterfield excelled all their contemporaries in this department of letters. The name of Lady Mary Wortley Montagu (1689-1762) must be added; but her keen wit and breadth of view are too often marred by the freedom of her language. With the decay of the drama, and the need for new intellectual amusement, came the conception of the modern novel. In 1740—a memorable date in the history of literature—Richardson, the first great novelist, gave to the world his famous *Pamela*. Eight years later appeared his *Clarissa*, which created a great sensation both in England and France. Rousseau frankly copied it, and Alfred de Musset has called it the best novel in the world. The *History of Sir Charles Grandison* was published in 1754. Other great novelists made bids for fame. Fielding, the greatest of them all, produced his *Joseph Andrews* (1742), *Jonathan Wild* (1743), *Amelia* (1751); but it was in *Tom Jones* (1749), his masterpiece, that for the first time an attempt was made to portray the life of a normal person. Sterne has left us two incomparable works: *Tristram Shandy* and a *Sentimental Journey*, unrivaled in style, originality, and pathos. Smollett, inferior to the three great novelists, has given us three books worthy of note: *Roderick Random*, confessedly modeled on *Gil Blas*, *Peregrine Pickle*, and *Humphrey Clinker*. The type of the first English novels remained for over half a century the sole model for continental fiction.

Meanwhile a new dictator had arisen to wield the scepter of Pope and Dryden. Samuel Johnson (1708-1784), though not the greatest writer, is the most colossal figure in English literature; a man of wholesome humor and fearlessness, majestic in intellect and noble of heart, Johnson was the center of the literary life of his day. He tried his skill at every kind of composition—poetry: he wrote *London* and *The Vanity of Human Wishes;* the drama: *Irene* is his one attempt; periodical essays: he contributed to the *Rambler* (1750-1752) and afterward to the *Idler*. In 1755 appeared the *Dictionary of the English Language*, a monument of industry and scholarship. His famous letter to Chesterfield struck the final blow at patronage, and made Johnson the first literary man to find in the public the only paymaster. His *Rasselas* introduced the didactic novel. The *Lives of the English Poets* is his *magnum opus*, and lifts biography into a loftier place in English literature. This brilliant though inaccurate work brings the criticism of the eighteenth century to a close.

This was the age of the historians Hume, Robertson, and Gibbon, the founders of a school of history of purely English growth. History now became a branch of creative literature, no longer to be classed with the "good old prattle" of the chronicles of Bishop Burnet. Hume (1711-1776), the philosopher and the greatest utilitarian of the age, led the way with his *History of England* from the union to his own time. The work was a new departure, but, though brilliant and lucid in style, it lacked the thoroughness of the later historians, and is no longer regarded as authoritative. Hume's success inspired Robertson (1721-1793), who wrote a *History of Scotland*, a *History of America* (1777), and a *Disquisition on Ancient India*. His style is colorless and lacks the graces of his predecessors, but the success of his books was phenomenal. But a greater than either of these now appeared, a brilliant exponent of modern historical research—Edward Gibbon (1739-1794). That stupendous work, the *Decline and Fall of the Roman Empire*, which Freeman regards as "the grandest of all historical designs," was launched in 1776 and completed in 1788. Gibbon's style is one of ornate splendor, and his treatment is broad and accurate. His work is raised on such solid foundations that it can never become obsolete or unnecessary. In the words of the historian Freeman: "Whatever else is read, Gibbon must be read, too."

One or two more names call for attention during this period: Edward Young (1683-1765), whose reputation as a poet rests almost entirely on his *Night Thoughts*, a work which inspired many imitators both in England and Germany; Adam Smith, the founder of the science of political economy, whose *Wealth of Nations* was published in 1776; Sir William Blackstone, whose *Commentaries on the Laws of England* appeared from 1765 to 1768; and Joseph Butler, the author of the famous *Analogy of Religion*, 1736.

A striking characteristic of this era is that literature is no longer the preserve of a leisured clique, but becomes the privilege of the multitude. Culture spreads beyond the pale of the metropolis, and for the first time English literature, breaking away from its long insularity, forms the taste of cultured Europe.

VI. The Age of Wordsworth and Byron (1784-1837).—Poetry once more came suddenly to the front and threw off the fetters of an uncompromising classicism. The revival of romanticism shadowed forth by Collins, Gray, and Thomson set free the spirit of true poetry. Men's ideals were ennobled and broadened; no longer was poetry treated as an exact science void of all passion, imagination, and feeling, but it again rang true with the melody and fervor of the soul. The vast political upheaval on the continent, and the wide acceptance of revolutionary teachings, left their mark on the literature of the day. Romanticism swept over Europe like an overwhelming wave. The voice of Rousseau rang out like a prophet; the oneness of man and nature was proclaimed, and the underlying law of Love was revealed. The harmonies between man and external nature, which Rousseau had perceived, were widened and spiritualized by Wordsworth, Keats, and Coleridge. The Romantic poet rekindled the "naturalness" of the past and combined it with the art of the present, standing toward his brother man as a seer and interpreter of life and nature. Clinging to the old traditions, but voicing the new ideals, Cowper is the leading poet of the transition. The unity of the race first found expression in his verse. His greatest work is the *Task*, 1785, which marks an epoch in modern English literature. His *Table Talk*, and the well-known ballad, *John Gilpin*, are his best known works. Crabbe and Blake in England and Burns in Scotland, each in his own way, promoted the new ideals. Burns (1759-1796), the poet of passion and spontaneity, has left us some immortal ballads—glimpses of his wasted genius. Burns gives expression to the brotherhood of man, and love lives blithely in his songs. He is the national poet of Scotland, and as a writer of Scottish verse he holds the foremost place.

The false canons of the rhetorical school were finally broken down by Wordsworth (1770-1850), who, in the words of Macaulay, "was the high priest of a worship in which Nature was the idol." Both in Nature and in man Wordsworth perceived the "hiding places of infinite powers." He was a true son of the human race, and voiced its inmost needs and strivings. He is a poet of childhood, for in the child the bond with nature is more perfect. "The Child is father of the Man," and the instinctive communion with nature should not be outgrown with childhood. Coleridge placed Wordsworth "nearest of all modern writers to Shakespeare and Milton, yet in a kind perfectly unborrowed and his own." Though he has not the vastness of Shakespeare nor the sublimity of Milton, no poet since the Elizabethan era has added so much to the lasting wealth of English verse. He has sounded the depths of the soul, and gives us strength, purpose, and peace. His philosophy is outlined in that noble poem, *Ode on Intimations of Immortality from Recollections of Early Childhood*. This is one of the few great odes of English literature, and would alone place Wordsworth among our greatest poets.

The fame of Coleridge (1772-1834) rests on his poems rather than on his prose. The *Rime of the Ancient Mariner* and *Christabel* are matchless specimens of poetic realism. Like his friend Wordsworth, Coleridge was a prophet of nature inspired by the impulses of the times. The weird, the supernatural, and tumultuous he interpreted with power and subtle insight. As a metaphysician he is a spent influence, but as a great poet his fame is undiminished. The friend of these two master poets, Robert Southey, can hardly claim rank as a writer of verse, though pulsing with the true poetic instinct. Southey's fame must rest on his *Life of Nelson* and *Life of Wesley*. The former is one of the most perfect biographies, on a small scale, known to modern literature. Scotland produced one more lyrist, Thomas Campbell, whose name will be preserved by such poems as *Ye Mariners of England*, *The Battle of the Baltic*, and *Hohenlinden*. Though no admirer of the Lake Poets, he was a romanticist, and a sturdy ally in the fight against didactic classicism. Even Samuel Rogers, whose *Pleasures of Memory* appeared in 1792, felt called upon to swell the growing choir when the romantic movement was at its height. His *Italy* was written in 1822, but though containing some fine phrases, can hardly rank as poetry. A melodious singer of this epoch, and one to whom modern criticism is perhaps unjust, is Thomas Moore, the Irish lyrist. Moore wrote a number of songs and ballads, but his most ambitious work is *Lalla Rookh*, for which Longmans paid him 3,000 guineas. Romanticism was further popularized by the great "Wizard of the North," Sir Walter Scott (1771-1832), whose *Lay of the Last Minstrel* in 1805 aroused the enthusiasm of Europe. *Marmion* followed in 1808, the *Lady of the Lake* in 1810, and the *Lord of the Isles* in 1815, besides other epical narratives which were less successful. As Wordsworth phrased it, Scott was "the whole world's darling"; but when Byron sprang into universal fame, Scott laid aside the harp to join in the praises of the greater poet. But the love of ancient chivalry welled up within him, and found expression in the world-famed series of *Waverley Novels*. *Waverley*, his first novel, was published in 1814; and his last, *Count Robert of Paris* and *Castle Dangerous*, in 1831. History lives in the deathless pages of these novels. His greatest results are wrought by the simplest means, and in this consummate mastery over his art Scott is excelled only by Shakespeare, and rivaled only by Goethe. His poetry is rich in color, and owes its force to its simplicity and vividness of phrase. But beneath this power of description and stirring narrative there are no depths that call to our deepest nature; there are no heights which bid our souls to soar. The age needed poetry throbbing with the passions and promises of the present. An unintelligible world hungered for a voice to express its hopes, its bitterness, and its rage; and turned with eagerness to the wild, unbridled verse of Byron. The pent-up spirits of the revolutionary era at last found an outlet, and England fell at the poet's feet dazzled by his brilliance and his daring. On the publication of *Childe Harold's Pilgrimage* Byron (1788-1824) "awoke one morning and found himself famous." His popularity was increased by the *Giaour* and the *Bride of Abydos*, 1813, and the *Corsair* and *Lara*, 1814; "and at twenty-four," writes Macaulay, "Byron found himself on the highest pinnacle of literary

fame, with Scott, Wordsworth, Southey, and a crowd of other distinguished writers at his feet." A reaction was caused by his domestic delinquencies, and Byron left England, in April, 1816, never to return. In temperament he was reactionary, but, as he was the hero of his own poems, he was a Romantic in spite of himself. The *Vision of Judgment*, *Beppo*, and *Don Juan* belong to the last six years of his life. *Don Juan* is considered his masterpiece, and reveals to perfection his many-sided power. In the words of a Quarterly Reviewer (October, 1871), "it forms the copestone of Byron's fame." Byron must be numbered with the greatest English poets. Modern criticism decries his art and his faulty meters; but he was a writer of force and passion, hurling his riotous numbers in proud defiance of all convention. Though not an original thinker, he imbibed the ideas of his age, and flung them wide in storm-swept verse. His poetry never reaches the sublime, and its influence on English verse is inappreciable. Prose writers, like Bulwer, it directly inspired; whilst on the continent, a legion of poets were fired by its spirit. The revival of Polish and Russian literature is due to Byron's influence, and the romantic writers of France worshiped at the altar of his genius.

Unlike Byron, Shelley (1792-1822) was a poet of supreme imaginative power. Like his own skylark he soared in the boundless realms of imagination, filling the heavens with the glory of his song. His fine lyrical drama, *Prometheus Unbound*, portrays a regenerated universe when the love in man and nature shall be all in all, and stands alone in modern poetry for the splendor of its conception and the beauty of its form. Who will forget his *Adonais* or the charm of his matchless lyrics? The *Ode to a Skylark* is the most perfect lyric of modern literature. As a prose-writer, too, Shelley holds a distinguished place. The sadness of his music slowly died, and the love he sang lifted his soul to the Fount of Love; until near his untimely death we find him writing an essay in praise of the Christ he once had despised.

The close of the revolutionary movement is marked by Keats (1795-1821), who, unmoved by the spirit of his age, sought inspiration from Spenser and the minor poems of Shakespeare. His *Endymion* and *Hyperion* are exquisite poems, rich in promise. His every ode is "a thing of beauty." The influence of Keats on English poetry has been considerable. He was the unconscious founder of the school of ornate and artistic poetry, which holds that art exists only for its own sake, and that beauty and loveliness alone are worthy to be worshiped.

Mention must be made of Leigh Hunt (1784-1859), a graceful poet and an essayist of the *Spectator* school; Walter Savage Landor (1775-1864), best known for his *Imaginary Conversations of Greeks and Romans*, and *Pericles and Aspasia*, as well as some dainty "occasional pieces"; Felicia Dorothea Hemans (1793-1835), whose poetry was long deservedly popular; and James Montgomery (1771-1854), author of the *West Indies*, the *Pelican Island*, and other poems.

Turning once more to the prose writers, the eighteenth century closed with the brilliant orations, the trenchant and melodious prose of Edmund Burke (1729-1797). His most powerful works are the *Reflections on the French Revolution*, 1790, *Letter to a Noble Lord* (the Duke of Bedford, who had attacked him for taking a pension), 1795, and the *Letters on a Regicide Peace*, 1796. His famous *Essay on the Sublime and Beautiful* belongs to the days of Johnson and Goldsmith. The close of the century gave us the inimitable *Life of Johnson*, by Boswell, and henceforward biographies came into great prominence. We must pass over the "School of Terror," founded by Mrs. Radcliffe, M. G. Lewis, Beckford, and William Godwin, in whose romances fear was the dominant passion; Miss Burney, a social satirist, whose *Wanderer* was produced simultaneously with *Waverley*, 1814; and Maria Edgeworth, whose delightful sketches of Irish life and manners charmed the readers of the first half of the last century. But the name of Jane Austen (1775-1817) bids us pause. Amongst the creators of literature Jane Austen takes a foremost place. Her six immortal novels, the best of which is perhaps *Pride and Prejudice* (the MS. of which went a-begging for nearly 20 years), were issued between 1811 and 1818. She wrote "with an exquisite touch which renders commonplace things and characters interesting from truth of description and sentiment"; and in her own province she has never been surpassed. Her influence on English fiction was wholesome and lasting. This is the age, too, of Hallam, Mill, and Mitford, the historians; of Paley, Hall, and Chalmers, the theologians; of Hazlitt, Broughton, Jeffrey, and Sydney Smith, the most celebrated of that brilliant coterie which gathered round the newly-founded critical organs—the *Edinburgh* and the *Quarterly Reviews*. William Gifford was the first editor of the *Quarterly*, 1808 to 1824. His most celebrated successor was J. G. Lockhart, whose biographies of Scott, Burns, and Napoleon are well known. The *London Magazine* came out in 1820, and in its pages first appeared Lamb's *Essays of Elia*, De Quincey's *Opium Eater*, and, later, Carlyle's *Life and Writings of Schiller*. De Quincey was one of the most brilliant writers of modern prose, a dreamer of exquisite dreams, though too rarely is the substance worthy of the style which enshrines it. Autobiography — impassioned, psychological, minute—was made by him a fertile branch of literature. The death of Byron was followed by a host of writers of "fashionable" novels, chief amongst whom were Edward Lytton Bulwer (afterwards Lord Lytton) and Benjamin Disraeli. Bulwer's *Pelham* (1828) and Disraeli's *Vivian Grey* (1826) were the beginnings of the "Dandy School" of fiction. A new era in criticism was begun in 1825 when Macaulay contributed his essay on Milton to the *Edinburgh Review*. This was the first of those famous essays, which now are "known to every schoolboy," and which have done so much to raise the level of cultivation. Such was literature when Queen Victoria came to the throne.

VII. The Modern Era.—In the lull which followed the outburst of the Byronic period, the voice of Thomas Carlyle thundered a newer message to a generation not yet ready to receive it. His *The French Revolution* burst upon the world in 1837, and the despised *Sartor Resartus* appeared in the following year. As an historian he had carved out a new path, laying bare

the minutest facts, and probing into the very souls of men. Herein lies his greatness. The "Seer of Chelsea," rugged and stern like an Alpine peak, was the greatest force in the literature of his day. His mission was to reconstruct, and *Sartor*, his most original and in some respects his greatest work, grappled with the perplexities of the times, and offered a grim solution. Walt Whitman aptly remarked that the army of British thought during this period with Carlyle left out "would be like an army with no artillery." His influence now is well-nigh spent, but his was the cry that stirred the blood of men like Ruskin. His later style was a deliberate creation by which to thrust home his gospel. The critics branded it as a chaos of capitals, compounds, and broken English; but, though Teutonic in form and in its labyrinthian periods, it was well fitted to his turn of thought. In striking contrast to Carlyle, though like him in his fundamental conception of history, is the ever-popular Macaulay. His *History of England* began to appear in 1848, and here his style is seen at its best. The accuracy of the *History* has been challenged; but Macaulay's weakness lay in too often drawing biased conclusions from statements too incomplete. His philosophic endowment was unequal to the immensity of his literary genius. The minstrelsy of Macaulay is as well known as that of Scott. The *Lays of Ancient Rome* were published in 1842. There is an unfading charm in the dash and swing of the noble lines, the clash of steel and the lust of battle. From two great prose writers we now turn to two great poets—Tennyson and Browning, both true descendants of the romantic school, both swayed in turn by Byron and Wordsworth, Shelley and Keats. Tennyson's one desire was to excel in epic narrative. The *Idylls of the King* are surpassed only by *Paradise Lost* as examples of non-dramatic blank verse in our language. Tennyson cannot equal the sublime stateliness of Milton, but to no other poet can the creator of the Idylls be compared. His *In Memoriam* (1850), a series of short poems woven together by a common sentiment, contains the most perfect representation of his genius, and is, moreover, a complete expression of the spirit of his age. His noblest work is pervaded by the true religious spirit. The Unseen is to him intensely real, and, gazing into "the abysmal deeps of personality," he is ever conscious of the greatness and immortality of the soul. In his tenderness and reverence towards woman Tennyson has never been excelled. As a dramatist, except in *Becket* (1885), he was not successful. From the death of Wordsworth to his own death, he wielded a vast power over English letters, and none challenged his supremacy as the greatest poet of his time. He lacks the inward strength of Milton, and the consummate ease of Wordsworth. It was Emerson who gave it as his opinion that the latter was *the* poet of modern England, and that "other writers have to affect what to him is natural."

We turn now to a greater mind, though not to so great an artist—Robert Browning. He is the Carlyle of poetry, and heeds not the form that bears his message. Strength to him is more than beauty. His style—rugged, condensed, involved—is the stumbling-block to the multitude; but his poetry has influenced the minds of the few, and these the leaders of the world of thought. His masterpiece, the *Ring and the Book*, is the most stupendous work of genius of our time; while his *Paracelsus* is one of the greatest poems in our literature. Elizabeth Barrett Browning, his wife, ranks as a great poet, though her writings are of uneven merit. *Sonnets from the Portuguese* and *A Child's Grave at Florence* are her best efforts. *Aurora Leigh*, an ambitious metrical romance, was extravagantly praised by Ruskin as the greatest poem of the century. The marriage of these two poets is one of the most beautiful unions in the history of any literature.

Among the dwellers on the slopes of Parnassus place must be found for Matthew Arnold and the three "pre-Raphaelite" poets, Rossetti, Morris, and Swinburne. Arnold (1822-1888) is at his best in his elegies, and his *Thyrsis* is no unworthy second to Milton's *Lycidas*. A purely intellectual poet, he speaks to the mind and never to the heart. Romanticism left him untouched and unmoved. He figured as a prose writer to a later generation, and his clear, classical style is seen to advantage in his *Essays on Criticism*, published in 1865. No poet in recent years has so greatly influenced the trend of verse as Dante Gabriel Rossetti (1828-1882). The excellence of his ballads, *The King's Tragedy* and *Rose Mary*, almost equals the beauty of his well-known sonnets. His sister, Christina Rossetti (1830-1894), "the soul whose breath among us was a heavenward song," is less great, though possessed of greater spontaneity. Most of her poems are of a devotional nature. Her sonnets, as in *Monna Innominata*, are almost perfect. The greatest work of William Morris (1834-1896) is *The Earthly Paradise*, modeled on the art of Chaucer, but lacking the master's spirit. Morris modestly describes himself as "the idle singer of an empty day." Algernon Charles Swinburne (1837-1909), a great metrical artist, enriched English literature by his *Atalanta in Calydon* (1865), a fine drama on the Greek model. His *Poems and Ballads* (1866), many of which are unworthy of him, at once "raised a storm, and founded a school." The lesser lights need not detain us long. Philip James Bailey's commonplace poem *Festus* came out in 1839. The following year Barham published his *Ingoldsby Legends*, the most popular of any humorous verse of the century. Of Hartley Coleridge, his sister, Sara Coleridge, Henry Taylor (author of *Philip Van Artevelde*), R. H. Horne (best-known by *Orion, an Epic Poem*), C. S. Calverley (the witty writer of *Verses and Translations* and *Fly Leaves*), the dramatists, T. N. Talfourd and J. W. Marston, A. H. Clough, Jean Ingelow, and the graceful writer, Adelaide Anne Procter (daughter of the poet "Barry Cornwall"), we can only make the barest mention.

The melodious paraphrase of the *Rubaiyat* of Omar Khayyâm published by Edward Fitzgerald in 1859 must be noted in passing. The school of poetry nicknamed by the Scotch poet Aytoun (1813-1865) "the Spasmodic," calls for little attention. Sydney Dobell (1824-1874) and Alexander Smith (1829-1867) were its two chief members, all of whom were better endowed with passion than intellect. The mystical lyrist, Cov-

entry Patmore (1823-1896), has more originality. His greatest work is *The Angel in the House*. His odes, *The Unknown Eros*, are well known. "Owen Meredith," the second Lord Lytton, published his *Clytemnestra and other Poems* in 1855. A better, though unrecognized poet, was J. B. Leicester Warren (Lord de Tabley), whose first volume of importance, *Praeterita*, was issued in 1863 under the pen name of "William Lancaster." His *Poems Dramatic and Lyrical* appeared in 1893.

The earlier works of fiction were characterized by naturalness, spontaneity, and absence of any underlying "purpose." The writers were content to unfold a tale. The evolution of the novel is not marked by well-defined shapes; but it may be noted that romantic fiction culminated in Scott, domestic fiction had its origin in Jane Austen, the "purpose" novel came into being with Thackeray, while with Dickens the spirit of humanitarianism and democratic sympathy first entered into fiction. Thackeray (1811-1863) created a new school; for his philosophy of life permeated his writings. Not only was he a great novelist, but one of the greatest masters of style in English literature. Thackeray wrote in all 26 volumes, but his fame must rest on his five great novels: *Vanity Fair*, *Pendennis*, *Esmond*, *The Newcomes*, and *The Virginians*. Closer to the nation's heart was his great contemporary, Charles Dickens (1817-1870). Dickens was a true lover of his fellow men, and his novels reveal his sympathies. The range of his creative genius was immense. *Pickwick*, *Oliver Twist*, *Nicholas Nickleby*, *The Old Curiosity Shop*, *Martin Chuzzlewit*, *David Copperfield*—these are household words; for truly has Dickens peopled our imagination with the creatures of his art. It is the fashion to magnify his faults and limitations; but his genius is bound up with the life of the race, and his name is among the immortals.

We now turn to the Brontë sisters, Charlotte (1816-1855), Emily (1818-1848), Anne (1820-1849), children of the wind and the Yorkshire moorland. Anne wrote *Agnes Grey* and *The Tenant of Wildfell Hall*, but these were eclipsed by the novels of her greater sisters. Charlotte owes her fame to three great stories, *Jane Eyre*, *Shirley*, and *Villette*. Emily's only novel is *Wuthering Heights*, a work of genius, though artistically faulty. Each wrote in a poet's prose, strong with passion. Charlotte Brontë undoubtedly ranks with the foremost novelists of the century. Another woman writer, George Eliot (Mary Ann Evans, 1819-1880), brings the race of giant novelists to a close. Her *Scenes from Clerical Life*, considered by some critics her masterpiece, appeared in 1856; and was followed by *Adam Bede* (her most popular novel), *The Mill on the Floss*, *Silas Marner*, *Romola*, *Felix Holt*, *Middlemarch*, *and Daniel Deronda*. Though her art is too often marred by weight of learning and philosophy, she is a great creative artist, great in mind and nature, and her place in literature is well secured. One of the most prominent writers of genius is Charles Reade (1814-1884), whose masterpiece is *The Cloister and the Hearth*. His popular book, *It is Never Too Late to Mend*, is one of the best examples of the novel of purpose. Charles Kingsley (1819-1875) shares with Reade a leading place in the secondary rank of novelists. His best novel is *Westward Ho!* In this, as in his *Alton Locke* and other novels, he preaches his "Muscular Christianity." Kingsley wrote some charming poems; *The Three Fishers*, *The Sands of Dee*, and *Oh, That We Two Were Maying* strike a note of rare genius. A writer of less pretension is Anthony Trollope (1815-1882), a portrayer of middle-class life in provincial England. His best work is *Barchester Towers*. Among the romancers of later days Robert Louis Stevenson (1850-1894) holds a place apart. His novels, *Treasure Island*, *Kidnapped*, and *Catriona*, though frankly written for boys, have won a permanent place in literature by their abiding charm and the beauty of their style. His poems, essays, and familiar letters all bear the stamp and glamour of his personality. The impulse given by Stevenson to the new romantic movement is seen in the novels of many writers of to-day, notably Stanley Weyman, "Anthony Hope," Max Pemberton, "Q" (A. T. Quiller-Couch), and Conan Doyle, the creator of *Sherlock Holmes*. One of the greatest and most intellectual novelists of recent times was George Meredith (1828-1909), who was a great poet expressing himself in prose. *The Ordeal of Richard Feverel* and *The Egoist*, both rich in satire and humor, are considered his best novels; but, owing to the style of this "Browning of novelists," his works were for many years caviare to the general reader. Less polished, but of striking originality, are the works of Thomas Hardy (1840-1928), some of which have been dramatized for the stage. Of his many books five are worthy of high place in English fiction: *Far From the Madding Crowd*, *The Return of the Native*, *The Woodlanders*, *The Mayor of Casterbridge*, and *Tess of the D'Urbervilles*. These two novelists have left their impress on almost all recent English fiction. Not far below them is R. D. Blackmore (1825-1900), author of *Lorna Doone*, a quasi-historical novel of the West of England, popular on both sides of the Atlantic.

The influence of Dickens is apparent in the novels of Wilkie Collins (1824-1886), the chief exponent of the "sensational" school, and in the works of those three *amuseurs*, James Payn (1830-1898), William Black (1841-1898), and Sir Walter Besant (1836-1901). The latter's *All Sorts and Conditions of Men* gave the idea for the People's Palace in the East End of London, opened by Queen Victoria in May, 1887. Of women novelists during this epoch, not the least distinguished is Mrs. Gaskell, whose *Cranford* and *The Life of Charlotte Brontë*, 1857, are likely to delight many generations. Two of the most remarkable religious novels are by women: *Robert Elsmere* by Mrs. Humphry Ward, whose best novel is *Marcella;* and the *Story of an African Farm* by Olive Schreiner. George Macdonald and J. H. Shorthouse, author of *John Inglesant*, also deal with religion from different standpoints. Amongst writers for children two names deserve more than passing notice: "Lewis Carroll" (Rev. C. L. Dodgson), author of *Alice's Adventures in Wonderland*, 1865, with its sequel, *Through the Looking-Glass*, 1872, and Andrew Lang, that versatile writer whose fairy-tales enchant the younger generation. There are many writers of deciduous fame, whose names are all too prominent in our lending libraries; writers who reflect the prevailing versatility and

want of thoroughness, and whose popularity is determined by their ability to amuse rather than their genius to create.

In the domain of criticism one name stands out preëminent. The enthusiasm of John Ruskin (1819-1900) has fired more minds to the quest of beauty than has been effected by any other writer in the history of the world. His sympathies, though at times violent and paradoxical, are well-nigh universal. He has written on art, literature, morals, economics, society, and almost everything; but as an art critic he will be best remembered. Ruskin is the greatest prose writer of modern times, and one of the most perfect masters of style and language that has ever lived. His three greatest works are *Modern Painters* (1843), *Seven Lamps of Architecture* (1849), and *Stones of Venice* (1851-1853). His social and economic writings are not always marked by soundness of thought or sobriety of judgment, but the nobility of their aim can never be gainsaid. Besides Ruskin and Matthew Arnold, another Oxford man calls for notice as a great critic. Walter Pater (1839-1894), whose genius was grudgingly recognized, has become a force in contemporary literature. He has been called "the most rhythmical of English prose writers," and his *Renaissance: Studies in Art and Poetry* and *Appreciations* give him high rank among modern writers. Benjamin Jowett (1817-1893), the celebrated master of Balliol, won his place in literature by his brilliant translations of Plato, Thucydides, and *The Politics* of Aristotle.

Of scientific writers. Charles Robert Darwin (1809-1882), the father of evolution, demands attention in a survey of literature. His epoch-making works, the *Origin of Species* (1859) and *The Descent of Man* (1871), have revolutionized thought, not only in regard to biology, but in philosophy, religion, literature, and literary criticism. John Tyndall (1820-1893), the physicist, was known as a popularizer of scientific truths rather than as an original investigator. Thomas Henry Huxley (1825-1895), the distinguished biologist, was a man of great literary power; and, besides winning fame for his original research, was a vigorous defender of the pioneers of evolution. He loved to "war upon the lions in the wood." Herbert Spencer (1820-1903) made a deep impression on the world's thought, and his philosophy is the most comprehensive application of the evolutionary principle that has ever been attempted. John Stuart Mill (1806-1873), the famous empirical philosopher, is no longer the stimulating force he once was. His reputation chiefly rests on his *System of Logic* and *Political Economy* (1848). Mill was assisted in his *Logic* by Alexander Bain (1818-1903), best known for his book on *Mental and Moral Science*. The leader for many years of the Hegelian school of philosophy at Oxford was Thomas Hill Green (1838-1882), whose *Prolegomena to Ethics* appeared after his death. One of the best-known scientific writers of his time was Sir John Lubbock, author of *Prehistoric Times, The Origin of Civilization and the Primitive Condition of Man* (1870), and the *Pleasures of Life*, a collection of miscellaneous essays whose popularity far exceeds their intrinsic merit. The name of Friedrich Max Müller (1823-1900) is known to every student of philology and ethnology. His most popular books are his *Lectures on the Science of Language*, and *Chips from a German Workshop*.

Of the many eminent historians who belong to the modern era, space will only permit of the barest mention. George Grote's *History of Greece* was published between 1846 and 1856. Dean Milman's *History of Christianity* (1840) and its continuation, the *History of Latin Christianity* (1854-1856), are still valuable books of reference. Froude's great work, the *History of England, from the Fall of Wolsey to the Defeat of the Spanish Armada*, is distinguished by the brilliance of its style, but unfortunately marred by inaccuracy and partisanship. In striking contrast to Froude is the greater historian, Freeman (1823-1892), who combined a remarkable breadth of historic view with the most scrupulous accuracy. William Stubbs, born at Knaresborough, Yorkshire, in 1825, published his monumental work, *The Constitutional History of England* in the years 1874 to 1878. He illuminated the byways of history, and as Regius Professor of Modern History at Oxford he gave a lasting stimulus to historical study and research. Sir Thomas Erskine May traced the growth of the English Constitution from where Hallam left off, and, by his *Constitutional History of England since the Accession of George III.*, made a valuable contribution to historical literature. Maine's great work on *Ancient Law* was produced in 1861, and established the author's name as an original thinker. Mandell Creighton's great work, *A History of the Papacy from the Great Schism to the Sack of Rome*, is of the highest value. The *Short History of the English People*, by John Richard Green, made a sensation on its appearance in 1874. It treated history in a new vein, and was written in a picturesque style of poetic beauty and brilliance. Green expanded the *Short History*, but the larger work as a literary effort was not so successful. Of Samuel Rawson Gardiner, Sir John Seeley, W. E. H. Lecky, and James Bryce, as historians, and Walter Bagehot, the great authority on banking and finance, we must be content with recording their names.

Edwin Arnold continued the Victorian interest in religion in his poems on Buddha and Christ the *Light of Asia* and *Light of the World*. Men like John Morley, Andrew Lang, Edmund Gosse, Arthur Symonds, George W. Russell, and Hilaire Belloc, brought critical literature to a high level. Later poets like Alfred Austin, Robert Bridges, Alfred E. Housman, Mrs. Alice Meynell, Lionel Johnson, and Francis Thompson gave nature and lyric poetry new repute. Kipling charmed millions with his stories of India and his poems of soldier life. Robert Louis Stevenson added new charm to the personal essay, and revived the novel of romantic adventure, while Thomas Hardy stood for a sterner realism. The exotic Oscar Wilde, who wrote clever dramas, gave us one terrible picture in his poetic *Ballad of Reading Gaol*. Henry A. Jones, Arthur W. Pinero, and Bernard Shaw raised drama to new heights, while John Synge, William Butler Yeats, and Lord Dunsany revived a distinct Irish literature of play and story. Strachey "debunked" biography, and Conan Doyle, Joseph Conrad, and J. M. Barrie exalted the short story.

Gene Stratton Porter

AMERICAN LITERATURE.

There is a tendency among many writers on the history of American literature to include in the survey everything in the nature of a book. In this way they seek to show that the literature of the country is extensive and they measure the literary growth and progress in quantity only. But the day has long passed by when it was at all, if ever, necessary to bolster up the national achievements by such padded methods. It is infinitely better to measure the literary activity of our country by the same methods which are applied to the study of the literature of other though much older countries, and see in the accomplishments of its literary forces the promise of greater things yet to be done.

It is not at all strange that there is little worthy of record prior to the year 1700. From 1608, when John Smith's *True Relation* was published in London, until 1639, when Stephen Daye set up his first printing press in Cambridge, Mass., such books as were written by those who lived in America were printed in England. While Milton and Shakespeare were producing their glorious works in England, their fellow-countrymen in America were writing nothing of the slightest æsthetic value in their new homes across the seas. Their writings are of value to the historian and the antiquarian only. Captain Smith's contribution to the history of Virginia, William Strachey's story of the wreck of Sir Thomas Gates, Colonel Norwood's account of the wreck of Governor Berkeley, Governor Berkeley's share in the *Burwell's Papers*, John Hammond's *Leah and Rachel*, George Anson's *Character of the Province of Maryland*, Daniel Denton's *Brief Description of New York*, and Gabriel Thomas's *Account of Pennsylvania and New Jersey* are all that the South and Middle American colonies contributed to the literature of America before 1700.

But in New England there was no dearth of literary contributions. Governor Bradford of Plymouth and Governor Winthrop of Massachusetts in history; Thomas Hooker, Thomas Shepard, John Cotton, and Peter Bulkley in religion and theology; Roger Williams, one of the greatest of the early Americans; Daniel Gookin on the Indians; Nathaniel Ward in satire; John Josselyn in adventure; the *Bay Psalm Book* of 1640; Mrs. Anne Bradstreet, Michael Wigglesworth, Peter Folger, and Rev. Urian Oakes in poetry are the chief names in New England literature in the seventeenth century. Early in the next century are the famous and voluminous writers Increase and Cotton Mather, Judge Sewall's *Diary* (1673-1729), Mrs. Sarah Kemble Knight's *Diary* of a horseback ride from Boston to New York (1704), and the verse of Rev. Mather Byles and Joseph Green. The history by Rev. Thomas Prince and the *Summary* by William Douglass are notable works of the early eighteenth century. In metaphysics, Jonathan Edwards, who ranks as the most original theologian and metaphysician America ever produced, is famed alike for his *Freedom of the Will* (1754) and his awe-inspiring sermons, such as the famous one of Enfield, Conn. Benjamin Franklin, with all of his contributions to the study of natural science, politics, and homely moral philosophy, gave us in his *Autobiography* the only truly literary classic which America produced before the nineteenth century. John Trumbull, the author of *McFingal*, and his companion satirist, Francis Hopkinson; Thomas Godfrey, who gave us in *The Prince of Parthia* our first real poetical tragedy; Joel Barlow's *Columbiad;* Thomas Hutchinson, historian and dramatist; Mrs. Mercy Otis Warren; Phillis Wheatley, the negro poetess; the "Hartford Wits"; Mrs. Susanna Haswell Rowson, author of *Charlotte Temple;* Thomas Paine, who contributed much towards the spirit of '76; and Crèvecœur in his *Letters from an American Farmer* (1784); Royall Tyler, with the first important American comedy, *The Contrast* (1786); the philologists, Noah Webster and Lindley Murray; and our first novelist, Charles Brockden Brown, with his *Wieland, Ormond,* and *Arthur Mervyn,* published 1797-1800, are noteworthy at the close of the eighteenth century. Glancing over these names, which are only a few of the most prominent, it is hard to understand the statement that has sometimes been made by writers that practically nothing worth while had been done in literature in America until after 1800. It is well to modify that criticism and to say that, while every one recognizes that the best in American literature was done after 1800, there was much good work accomplished in those early days while a great nation was being built by practical, resolute men with little leisure to devote to æsthetic development.

The nineteenth century begun with John Marshall's *Life of Washington* (1804); Washington Irving's *History of New York;* the poetical works of Washington Allston, John Pierpont, and Mrs. Sigourney; and the dramas of John Howard Payne. The *North American Review,* founded in 1815, and the publication of *Thanatopsis* by Bryant in 1816 were important literary events; and before the first twenty years of the century had elapsed we had the works of Joseph Rodman Drake, author of *The Culprit Fay,* and the poems of Fitz-Greene Halleck.

Then followed James Fenimore Cooper, whose *Leatherstocking Tales* were the event of the third decade. They gave him a world-wide fame such as has been achieved by few American writers. Contemporary were James Gates Percival, Edward Coate Pinkney, Jared Sparks, George Ticknor, Lydia Maria Child, Edward Everett, Channing the elder, and Bronson Alcott. Webster's reply to Hayne belongs also to this time. From 1830 to 1840 is a period of beginnings. The *Liberator* was founded by William Lloyd Garrison in 1831 and the anti-slavery movement began with this and his association with Whittier, who published his first book in this decade. Nathaniel Parker Willis was the most representative man of letters in New York. Simms, Kennedy, and Bird were writing their romances in the South, and George Bancroft was beginning his career. In the early forties the Transcendental movement began in New England. This is the most important literary event in America before the Civil War. Apart from the literary excellence of the work of that school, it marks the transfer of the center of the most brilliant activity from New York to New England. The very names of Thoreau, Emerson, Hawthorne, and Poe mark this era as the most important in American literature. It is strange

that in America Hawthorne, through his *Scarlet Letter* (1850), and Emerson, as philosopher and poet, vie in the public minds as the foremost man of letters; yet, in Europe, that place is unhesitatingly given to Edgar Allan Poe, whose haunting poems and tales have gained a higher place abroad than has the work of any other American writer. At home, however, he is refused a niche in the Hall of Fame by his countrymen.

Of Longfellow's work it is almost sufficient to speak of its great cultural influence upon the American people. The question of literary merit or demerit or of relative rank pales before the recognition of his great value as the man who above all others taught the people of the country to love poetry. It has been for years more or less the fashion in literary circles to depreciate the genius of this best loved of American writers. That this criticism has been carried too far there is no doubt, and it is equally certain that in the inevitable reaction he will measure up at least nearly the equal of his greatest contemporary. Oliver Wendell Holmes has broken through the panoply of local fame and is attaining to national fame commensurate with his great gifts. James Russell Lowell's *Biglow Papers* (1848) gave him first place as poetical humorist and satirist among the antebellum writers. He afterwards became one of our foremost literary critics and letter writers. Between 1850 and 1860 those estimable historians, William H. Prescott and John Lothrop Motley, were building their fame, which is, perhaps, only excelled by that of their brilliant rival, Francis Parkman. Among these greatest names one must not lose sight of Richard Henry Dana, Jr., with his *Two Years before the Mast* (1840), and Herman Melville, writers of our best books of adventure; nor of Bayard Taylor, Donald G. Mitchell, Richard Grant White, James T. Fields, Thomas Wentworth Higginson, Charles Eliot Norton, George William Curtis, E. P. Whipple, Paul H. Hayne, Henry Timrod, Harriet Beecher Stowe, and Walt Whitman. Between 1860 and 1870, that period of tremendous national disturbance, we find, strangely enough, that prince of humorists, "Mark Twain," who at this day is probably the one American writer who enjoys a world-wide fame. Edward Everett Hale's *Man without a Country* appeared in 1863 at a time most fitted to develop a loyalty to the Union. To this time also belonged those two writers cut off in their early success, Theodore Winthrop and Sidney Lanier. From 1870 dates the rise of Francis Bret Harte, whose *Luck of Roaring Camp* (1868) ushered in that peculiar form of short story which deals with local phases of national life in all parts of the country. Previous to this time literature was centralized; New York and New England dominated the literary realm. The change is now perceptible and a score of names present themselves in other sections—names which have since become inseparably connected with the nation's literature. There are Joel Chandler Harris from the South with his *Uncle Remus* creation; Edward Eggleston with the *Hoosier Schoolmaster;* George W. Cable with his tales of Creole life around New Orleans; Mary Noailles Murfree ("Charles Egbert Craddock") with stories of the mountain whites of Tennessee, Kentucky, and Georgia; Harold Frederic from western New York state; Hamlin Garland from the Northwest; James Lane Allen from Kentucky; Mary E. Wilkins Freeman with her delightful delineations of New England life; and Frank Stockton's *Rudder Grange* pictures of a composite American country life. This was the beginning of the widespread literary activity and of the end of that literary supremacy which New England had so long enjoyed.

The work of such naturalists as John Burroughs gave way in popularity before the newer animal story writers, of which Ernest Thompson Seton was the pioneer. The immense popularity of General Lew Wallace's *Ben Hur* (1880) is a peculiar phase of literary appreciation. Francis Marion Crawford gave us the dramatic novel; William Dean Howells created the novel of American social life; Henry James planned novels so subtly psychological and of a style so refined as to be hard reading; the romantic novel was introduced by Anthony Hope Hawkins, an English writer, and rapidly taken up by such writers as Winston Churchill, Mary Johnston, Charles Major, Maurice Thompson, S. Weir Mitchell, Paul Leicester Ford, and others; and novels dealing with an individual struggle against social obligations, as Robert Grant's *Unleavened Bread*, Elizabeth Stuart Phelps's *A Singular Life*, and Booth Tarkington's *A Gentleman from Indiana*, were extremely popular.

After 1870 a few poets who rose above mediocrity were Thomas Bailey Aldrich, Edmund Clarence Stedman, Richard Henry Stoddard, Richard Watson Gilder, Henry C. Bunner, Richard Hovey, Clinton Scollard, and Theodosia Garrison. Eugene Field and James Whitcomb Riley idealized common life. Amy Lowell developed the vogue of free verse. Edgar Lee Masters amazed the world by the frankness of his *Spoon River Anthology*. Robert Frost made nature poetry more virile, while Carl Sandburg turned to steel and skyscrapers, Vachel Lindsay to chant of heroisms, Stephen Vincent Binét and John G. Neihardt to try for an American epic. Perhaps Edward A. Robinson excelled them all, mainly as a poet of human limitations. Sara Teasdale, Elinor Wylie, and Edna St. Vincent Millay attained distinction and power. Paul Lawrence Dunbar created a new negro lyric.

History favored human interests in the work of John Fiske, John B. McMaster, James Ford Rhodes, Woodrow Wilson, and James Harvey Robinson. Later criticism finally rose to independence in the classical essays of Paul Elmer More, Irving Babbitt, William C. Brownell, Henry S. Canby, Stuart P. Sherman, and in the iconoclast, Henry L. Mencken. Gamaliel Bradford led in a new biography like that of Strachey in England.

Drama in America showed new vigor, worthy of the days of Fitch, Thomas, and Belasco. William Vaughan Moody, Josephine Preston Peabody, Percy MacKaye, and Charles Rann Kennedy led the literary dramatists, while Eugene O'Neill, Sidney Howard, George Kelly, with their followers, excelled in technique. The novel and the short story, the glory of America, developed such later masters as O. Henry, Mary Wilkins, Alice Brown, Joseph C. Lincoln, Hamlin Garland, and George W. Cable, who pictured various localities, and such psychologists as Hergesheimer, Willa Cather and Dreiser. Sinclair Lewis for his novels won the Nobel Prize.

CANADIAN LITERATURE.

For a young nation whose early life was a constant battle for existence, Canada holds a prouder place in the republic of letters than any other British colony. The germs of a national literature are steadily unfolding, and, although no towering genius has yet arisen, there are a legion of writers who have interpreted their native land with distinction. But first we must notice the writings of the old French explorers and missionaries. Seventeen years before the *Mayflower* sighted these shores, Samuel de Champlain produced his work on the Indian tribes, and ten years later his well-known *Voyages*. The first poems written in the New World were *Les Muses de la Nouvelle France* by Lescarbot, who records the founding of Port Royal on the Bay of Fundy in 1605. The romantic history of New France has attracted such able writers as Charlevoix, Abbé Ferland, Garneau, and others. In the domain of poetry many French-Canadian writers have won considerable distinction. We may mention Casgrain, author of *Les Légendes;* Tassé, who wrote *Les Pionniers de l'Ouest;* Crémazie, author of the fine elegy *Les Morts;* Le May, Sulte, and Fréchette. The latter, who is a brother-in-law of W. D. Howells, the American novelist, was honored in 1880 by the French Academy.

Of the earlier Canadian writers who made English their vehicle none is more famous than Judge Haliburton, whose immortal *Sam Slick, the Clockmaker* (first published in Joseph Howe's newspaper, the *Nova Scotian*), is treasured wherever true wit and humor are appreciated. John Galt, by his *Lawrie Todd, Bogle Corbet*, and other books dealing with Canadian life, is, though only a three years' sojourner in the country, a worthy contributor to Canadian letters. Charles Heavysege (1816-1876) wrote a number of poems, novels, and tragedies; but it is as the author of *Saul*—a noble theme nobly treated—that he is best remembered.

The poets of Canada have drawn their inspiration largely from the motherland; but many writers have arisen who have voiced the patriotism of their native country. *Dominion Day*, by John Reade, is one of the best of these patriotic poems. More popular, though of less poetic value, is *The Maple Leaf Forever*, which has been set to music by the author, Alexander Muir. The versatile writer, Charles G. D. Roberts, has given us some polished verse of a similar character. Like most Canadian poets he has found his greatest inspiration in the lavish wealth which nature has provided. We see this in such of his poems as *Resurrection* and *Kinship*. William Alfred Campbell drew from the same source, but perhaps the foremost nature-poet is Archibald Lampman. His work is uneven, but some of his poems, such as *April in the Hills* and the sonnet *Midsummer Night*, are marked by strength and originality. His biographer, Duncan Campbell Scott, is fired by the same muse, and his *Labor and the Angel* have a calm and freshness of their own. The poems of Alexander McLachlan, who has been called "The Burns of Canada," and William Edward Hunt, are in true accord with nature. Wilfred Campbell. the "Lake Poet of Canada," is best known by his *Lake Lyrics*, although *The Dread Voyage* and *Mordred and Hildebrand* have been widely commented upon in America and England. The first native poet whose verses met with recognition by the leading English critics was George Frederick Cameron (1854-1885). His defiant *What Reck We of the Creeds of Men?* will not be forgotten. Though every true Canadian is a lover of nature, with a due appreciation of what is noble and sublime. yet other themes have been sung by many of the most successful poets. The romance of Canadian history has not unnaturally fired the native bards, and the heroic deeds of Champlain, Cartier, Montcalm, Daúlac, Wolfe, Brock Tecumseh, and Laura Secord, have been enshrined in noble verse. George Murray's *How Canada Was Saved*, M. J. Ratzmann Lawson's *The Battle of Grand Pré*, Sarah Ann Curzon's *The Loyalists*, and Frederick George Scott's *In Memoriam*, are amongst the best poems of this description. Perhaps Canada's greatest lyrist and most original verse writer is Bliss Carman. His *Low Tide on Grand Pré* and *Behind the Arras* reveal a true poetic genius wedded to a fine technique. Space will not allow of more than the briefest mention of other poets, whose healthy verse is helping to mold a truly national literature. Francis Sherman, whose work recalls that of William Morris, aspires to the first rank with his idyllic *Matins;* Arthur Weir's *The Snowflake, and Other Poems*, contains much that is meritorious; Theodore H. Rand is associated with all that is best in Canadian poetry; John Stuart Thomson shows exceptional talent in his *Estabelle* and *A Day's Song;* Arthur J. Stringer has given us some lyrics of rare promise and originality; Charles Mair, author of the drama *Tecumseh*, has written some fugitive poems of undoubted talent; John Henry Brown's *Poems Lyrical and Dramatic* are deserving of wider attention; Bernard McEvoy's *Away from Newspaperdom* are pregnant with human interest; William T. James is the author of *Rhymes Afloat and Afield;* William Douw Lighthall has written some vigorous verse; E. B. Brownlaw has produced some scholarly lines; Dr. Thomas O'Hagan has contributed his two books of poems, *In Dreamland* and *Songs of the Settlement;* while the ever-popular Dr. W. H. Drummond, who stands in a class alone, has given us a number of French-Canadian poems combining humor, pathos, and picturesqueness in no stinted measure. In embodying the speech and thought of the *habitant* he has struck a rich and original vein. Of the women writers who have courted the muse, the most distinguished are Isabella Valancy Crawford, best remembered by her lyrics, *The Master Builder* and *The Axe of the Pioneer;* S. Frances Harrison ("Seranus"), the author of many poems descriptive of French-Canadian life; Ethelwyn Wetherald, Jean Blewett, Agnes Maule Machar ("Fidelis"), Elizabeth Roberts MacDonald, Mrs. McLeod, and Pauline Johnson—a lady with Mohawk blood in her veins—these have contributed freely to the great wealth of Canadian verse.

Of the prose writers Gilbert Parker has won an international reputation by the brilliancy of his works. His best known volumes are *Pierre and His People, Tales of the Far North, An Adventurer of the North, A Romany of the Snows, A Lover's Diary, The Trail of the Sword,*

The Seats of the Mighty, The Trespasser, and *The Battle of the Strong.* William Kirby is the author of the remarkable historical novel, *The Chien d'Or.* Another novel of Quebec is *The Bastonnais,* by John Lesperance. Among other story writers may be mentioned Major John Richardson, G. M. Adam, Susanna Moodie (sister of the accomplished Agnes Strickland), Lily Dougall, Miss M. M. Saunders, William McLennan, W. A. Fraser, Sara Jeannette Duncan (Mrs. Cotes), Jean McIlwraith, E. W. Thomson, Ralph Connor, Ernest Thompson Seton, and Grant Allen (a Canadian by birth though usually counted amongst English authors).

In the more serious departments of letters, such as science, history, and philosophy, Canada can boast of many able writers. Sir William Logan, the eminent geologist, is the first Canadian scientist to take European rank. Sir J. W. Dawson and his son, Dr. G. M. Dawson, have worthily maintained the tradition, and are numbered amongst the greatest scientists of modern times. Among historians, besides the world-famed Goldwin Smith, must be noted Sir John Bourinot, Sir James Lemoine, Dr. Kingsford, C. G. D. Roberts, Robert Christie, James Hannay, George Bryce, J. C. Dent, Doughty, whose six volumes on Wolfe's campaign is an important contribution to Canadian history, Dr. Todd, author of the authoritative *Parliamentary Government in England,* and Dr. Theal, famous for his monumental *History of South Africa.* Sir John Murray, who was born at Coburg, Ontario, is the great authority on oceanography; while Dr. Crozier, who has settled in England, is one of the most original thinkers to whom Canada has given birth.

LATIN-AMERICAN LITERATURE.

The literature of South America has not received the attention from the North that it certainly has merited; yet there is no country south of the Rio Grande but what can boast of an extensive literature and men of letters whose work commands a wider recognition. Long before Harvard opened its doors to students, colleges and universities flourished in the Spanish settlements. The University of the City of Mexico was founded in 1553, and the University of San Marcos at Lima in Peru in 1555. The best of Spanish culture was carried to the New World, and a community of intellectual interests was maintained between Spain and her colonies so long as the political ties existed. But this continental influence was not without its drawback on the native-born product, for the deterioration of letters in Spain followed by the corruption of taste known as Gongorism, was reflected in the Spanish-American literature of the seventeenth and eighteenth centuries.

In due course the influence of the Encyclopedists and of Rousseau began to be felt; while the scientific expeditions of José Celestino Mutis (1760), also of Humboldt and Bonpland (1799-1804), revived an interest in the physical sciences, and exercised a salutary influence on South American culture. Independence of thought was stimulated and a race of native writers arose whose continuity has never been broken.

The most noted poet of the revolutionary period was José Joaquín Olmedo of Ecuador (1781-1847), whose chasteness of style and magnificence of rhetoric earned for him the title of "the American Pindar." The impress of romanticism is apparent in the verse of the Guatemalan José de Batres and of the Cuban J. M. Heredia, whose *Ode to Niagara* is justly celebrated.

The foremost name in the history of Spanish-American literature is unquestionably that of the illustrious Andrés Bello (1781-1865), one of the greatest masters of Castilian verse. Much admired are his *Agricultura en la Zona Torrida* and *Oración por Todos,* the latter of which was inspired by Hugo's *Prière pour Tous.* Another revolutionary hero and writer was Carlos Maria de Bustamante (1774-1848), whose greatest literary achievement was the history of the Mexican revolution. Meanwhile in Brazil Domingo Borges de Barros, Viscount of Pedra Branca (1783-1855), established himself as the favorite poet with his pleasure-breathing *Poesias offerecidas ás Senoras Brazileiras.*

In Latin-America politics and letters have gone hand in hand, and it is the rule rather than the exception for public men to be also writers. No branch of literature has been more assiduously cultivated than criticism. Among the leading critics may be mentioned Calixto Oyuela, Torres Caicedo, Miguel Luis Amunátegui, Rafael M. Merchán, Martin Garcia Mérou, and Garcia Velloso.

The novel was not seriously attempted till the latter half of the nineteenth century. The Colombian poet, Jorge Isaaks, is well-known by his *Maria,* and his compatriot, Julio Arboleda, has written a bright romance, *Casimiro el Montañés.* Mexico has produced four novelists of distinct merit: José T. del Cuellar, I. M. Altamirano, Orozco y Berra, author of *Escenas de Treinta Años,* and Dr. J. J. Fernández Lizardi, better known by his nom de plume "El Pensador Mexicano." The Argentine historian, Vicente Fidel Lopez, has written a stirring historical novel entitled *La Novia del Hereje;* his compatriot José Mármol is the author of a really fine romance *Amalia.* Among the more noted Chilean novelists are Vicente Grez, Ramón Pacheco, Alberto del Solar, and the poetess Rosario Orrego de Uribe. Brazil has produced three eminent writers of fiction, Martiniao Alencar, Joaquin Manoel de Macedo, and Bernardo Guimaraes.

The output of poetry has always been enormous, due chiefly to the ease with which the Spanish and Portuguese languages lend themselves to versification. The names of the poets are therefore legion. In Mexico four names will serve to represent the different styles of poetry cultivated: Fernando Calderón, Manuel Carpio, J. J. Pesado, and Manuel Acuña. One of the finest examples of South American verse is *Gonzalo de Oyón* by the Colombian Julio Arboleda (1817-1862). Among modern poets and dramatists may be mentioned Silveria Espinosa de Rendón and A. J. Restrepo, of Colombia; Estebán Echeverria (1809-1851), M. Coronado Adán Quiroga, Rafael Obligado, of Argentina; Arnaldo Márquez, M. N. Corpancho, Cleménte Althaus, and Numa Pompilio Llona, of Peru; C. W. Martinez, and G. B. Gana, of Chile; F. Javier de Acha, of Uruguay; J. Batrés y Montufar, M. Cordoba and Garcia Goyena, of Guatemala; Antonio G. Dias and D. J. G. Magalhaes, of Brazil.

OUTLINES OF THE WORLD'S LITERATURE.

A CONTEMPORANEOUS AND CONSECUTIVE ARRANGEMENT OF BOOKS AND AUTHORS FOR REFERENCE AND STUDY.

Alphabet.—The earliest form of written description, or thought transference, was by means of pictures. This has been used by nearly all primitive people from the early Egyptians to the North American Indians. The latter, however, never developed a written language. The picture language, or hieroglyphic form, succeeded the ideogram, or picture, and gave rise to the alphabetic or sign form. The hieroglyphic form was used by the Egyptians (until 700 B.C.), Chinese, Babylonians, and Mexicans. In 700 B.C. the hieroglyphic form in Egypt was superseded to some extent by the demotic or popular form of writing. Hieroglyphics are so called because the form was largely confined to the priestly class. The Babylonian took the form of wedge-shaped or cuneiform signs.

Cuneiform or wedge-shaped writing is one of the earliest forms of the alphabet. It originated in Mesopotamia and spread even to Armenia and Egypt. The earliest texts are at least 6,000 years old. The characters were impressed on soft clay with a tool, but a chisel was used for the rock-cut inscriptions. The most remarkable inscription is cut on the almost perpendicular side of Mount Behistun over 300 feet from the ground. It records the reign of Darius I. (521 B.C.) and is in three languages: the Old Persian, Babylonian, and the New Susian.

The Assyro-Babylonian alphabet is the most important and complicated of all. In 1887, at Tel-el-Amarna on the Nile, about 180 miles south of Memphis, were discovered 320 bricks with inscriptions, some so minute that there were six lines to the inch and had, evidently, been cut with the aid of a magnifying glass. The tablets vary in size from nine inches by six inches to one inch square.

Other cuneiform alphabets are in the New Susian, the Armenian, and the Old Persian languages.

The oldest inscription in the Phœnician language is on the Moabite Stone, detailing the wars of Mesha and Ahab about 853 B.C., found at Dibon in Moab in 1868. This and the inscription at the pool of Siloam, telling how the tunnel was cut through, are in the North-Semitic languages.

The Phœnicians, who were the early world-traders, first developed the alphabet and gave it to the world about 1000 B.C. From the Greeks all Europe derived their alphabets, either directly as the Russian, or through the Latin.

A peculiar form of writing known as Runes, or Runic writing, was used by the early Germanic tribes and communicated by them to Denmark, Norway, Sweden, Ireland, Germany, Great Britain, France, Spain, and Roumania. Its origin is obscure, but is believed to date from about the second century A.D., though some place it as far back as 600 B.C. It is an adaptation of the Greek alphabet and was much used in carving inscriptions on stone, metal, and wood.

Materials.—The earliest literature was engraved on stone or on baked brick or on metal. In the temple of Nippur tablets were discovered which are believed to have been written 6000 B.C. They are in the Chaldean language, and measure nine inches by six and one-half inches. They are hymns and invocations used in worship in the temple.

The earliest Egyptian literature other than the inscriptions on certain tombs is the "Book of the Dead," which was placed in tombs and in mummy-cases. This is a collection of prayers, hymns, psalms, and magical incantations. These date back to about 2500 B.C.

The earliest Chinese is about 1150 B.C. The book is called the Y-King, the Book of Metamorphoses or of Developments.

The Ten Commandments were written on tablets of stone.

The Laws of Solon (about 594 B.C.) were inscribed on wooden planks.

The skin of goats dressed on one side only came into early use and was the first step toward parchment.

Papyrus was used as far back as 3600 B.C. It was made into rolls from the pressed pith of a species of reeds. The plant is from 3 to 10 feet high. The sheets of papyrus seldom exceeded 15 inches wide, though from 8 to 12 inches is very commonly met with. One roll measured 144 feet in length. It was soft, easily mutilated, and the wonder is that any have survived.

The earliest extant Greek papyrus belongs to the fourth century B.C.

Parchment was known as early as 500 B.C. In Rome the manufacture of parchment rose to great importance in the first century B.C. This was the medium for writing until the invention of paper by the Chinese at an early unknown date. The first paper mill in Europe was erected in Fabriano, Italy, in 1150.

Parchment that has been used a second time by erasing the original writing is called a palimpsest.

B.C.	EGYPT, BABYLONIA, INDIA, CHINA.
4000	"Book of the Dead." Some portions profess to date back so far, though the greater part was written 10 centuries later. "Proverbs" as contained in the Prisse Manuscript, attributed to a writer of the III. Dynasty about 4000 B.C. **King Athothis,** also a physician, wrote anatomical works.
3700	**Seneferu,** first of the pyramid kings, the earliest Egyptian monarch to leave behind an inscription, which is at Wady Magharah.
3300	A papyrus on "Ethics," written during the reign of Tat-ka-ra by **Ptah-hotep,** probably the oldest manuscript in the world.
3000	Biographical inscription of Una, found on a slab in the cemetery of Abydos, about 3000 B.C. Hymn to Usertesen III., about 3000 B.C.
2800	"Story of the Shipwrecked Sailor," author unknown, written about 2800 B.C. Manuscript in St. Petersburg.
2500	"Story of Sanehat," author unknown, written about 2500 B.C. Manuscript in Berlin. "Teaching of Amenemat," author unknown, written about 2500 B.C.
2200	Code of **Hammurabbi,** king of Babylonia, engraved on stone about 2200 B.C., contains 280 edicts in four columns.
2000	"Songs to the Harp," a collection dating back to 2000 B.C. Egyptian.
1700	Hymns to Amen Ra, written about 1700 B.C. Egyptian.
1700	Rhind papyrus in the British Museum, a mathematical work. "Directions for Obtaining Knowledge from all Dark Things," copied before 1700 B.C. by Ahmes, an Egyptian scribe, from a treatise written in 2500 B.C.
1650	**Pentaour,** "epic poet," celebrates the deeds of Rameses II. Public library founded at Thebes and copies of manuscripts made.
1600	Chronology of Kings of Egypt, made by direction of **Thothmes III.**
1500	Papyrus Ebers, a hieratic or sacred treatise on medicine, written about 1500 B.C., discovered by Ebers in 1872. One of the best preserved Egyptian papyri in existence. Vedas of India, more than 100 books, extending over centuries of time, but begun about 1500 B.C., shortly after the Aryan migration into India. The three divisions are the Rig-Veda, Yajur-Veda, and Sama-Veda. They consist of Hymns, Psalms, Prayers, Melodies, Blessings, and Curses.
1500	"Maxims of Any," written about 1500 B.C. Egyptian.
1450	"Story of the Doomed Prince," written about 1450 B.C. Manuscript in the British Museum. Egyptian. "Hymn to the Aten," **King Akhenaten,** written about 1450 B.C. Egyptian.
1400	The Tel-el Amarna letters: 320 bricks or tablets found south of Memphis in Egypt in 1887. Written about 1400 B.C. **Abdi-chiba** (1403-1385 B.C.), Governor of Jerusalem, wrote at least six of them. They are state documents.
1300	"Story of the Two Brothers," written about 1300 B.C. "Story of Setna," written about 1300 B.C. Egyptian.
1200	**Wen Wang,** the founder of the Chow dynasty in China, wrote the "Book of Changes."
1100	The Abbott papyrus containing a full account of the tomb robberies in Egypt in the reign of Rameses IX.; written about 1100 B.C.

B.C.	GREECE	ASIA, EGYPT
1000	**Homer** wrote or compiled "Iliad" in 15,693 lines and the "Odyssey" in 11,670. Herodotus dates them about 850, but they seem to be of the age about 950. Homer or imitators wrote hymns and many poems now lost.	
900	**Hesiod's** "Works and Days" describes life of men; his "Theogony," the gods; his "Shield of Herakles," a national hero.	**Chinese** odes collected, but later revised for the Confucian "Shih Ching" in 6th. century.
800	Songs, hymns, and other early literature mentioned later, and a few fragments have come down to us.	Conquest of Egypt by King Piankhi of Nubia told on huge **stele** found at Gebel in 1862.
700	**Terpander** of Lesbos began choral lyric. **Alkman** wrote nature and war songs for a chorus. **Kallinos** made elegies, **Tyrtaeos** wrote of law and order, **Archolochos** satirized the girl who refused to marry him and was long admired for his dash and fire. **Solon** is known for his oratory and work on reform. **Sappho,** of Lesbos, delighted her friends by her songs.	**Aryan lyrics** collected. Early Vedic or priestly literature. First great Vedas polished by the priests. They include songs of praise, melodies, liturgies and blessings, and religious myths. Came to be known as **Brahmanas.**
600	**Alkaios** and **Stesichoros** imitated Sappho, but also wrote on politics in the 42d Olympiad. **Anakreon** later wrote of the joys of life and regret for old age. **Theogonis** perfected the moral elegy. Many other good poets in Greece.	"Upanishads" by 600 explained the Vedas, gave rise to a new Buddhism, and stressed transmigration of souls.
500	**Pindar,** born about 522, carried the lyric to perfection. The Attic drama soon arose to take its place. We now have many of Pindar's odes. **Simonides** wrote for many occasions and so sang for his bread.	"Sutras," last of the great Vedic literature, explain the rituals, home life, and laws.
	Thespis began classic Greek drama about 550. Called "father of tragedy."	The "Avesta" of the Zoroastrians of Persia, contained prayers, priestly code, and 21 hymns. We have only a part now. The Magi who came to Bethlehem were of this faith.
	Seven tragedies by Æschylus: "Suppliants," "Persians," "Prometheus Bound," "Seven against Thebes" in three parts.	
	Also seven, with fragments of 80 others, by **Sophocles,** about 495-406 B. C. "Ajax," "Electra," "Antigone," and the Edipus plays.	**Buddha,** sage of India, compiled ancient lore in three "baskets," the "Triptika," made up of discipline, discourses, and psychology.
	Eighteen plays, and hundreds of fragments, from **Euripides** (before 400 B. C.) include "Alcestis," "Helena," "Medea," "Ion," and two Iphigenia dramas.	In this century began Persian literature with the cuneiform or wedge-shaped inscriptions. Darius I, about 515, started three tablets, 410 lines, carved in the lime stone rock of Behistun (modern Bi-stun), some 1,700 feet above the plane. They are in three languages, Old Persian, Babylonian, and Elamite. By finding the key to these characters Rawlinson (1835-1847) gave us knowledge of Babylonia.
	Of 54 plays by **Aristophanes,** 11 comedies are extant, such as the "Clouds," "Wasps," "Birds," and "Frogs."	
	Zenophanes and **Anaxagorus** wrote philosophy. **Andocides, Isocrates,** and **Lycurgus** are best known of the early Attic orators.	
	Herodotus, "father of history," wrote his "Travels" and "History" before 440, and **Thucydides,** by 400, had written his "Peloponnesian War." Before 355 Xenophon finished the last, described the campaign of Cyrus in his "Anabasis," and the education of Cyrus in the "Cyropaedea."	**Confucius,** Chinese scholar, wrote the "Annals of Lu," or "Spring and Autumn." He edited the "Shih King" or ancient poems, and his grandson wrote a remarkable work "The Doctrine of the Mean." Mencius compiled the teachings of Confucius.
	Socrates left no written records, but **Plato** explained his teachings in the "Crito," "Dialogues," "Symposium," and others. His "Republic" describes a model state.	
400	**Demosthenes** (384-322), greatest ancient orator, known for his speeches against Aphobus, Leptines, Ctesiphon, and "On the Crown," "On the False Embassy," and "On the Chersonese."	
	Aeschines and Hypereides, his rivals, known for their speeches, and the latter for his "Funeral Oration" and the "Athenogenes."	

B.C.	GREECE	ASIA, EGYPT
400	**Aristotle** (484-322) compiled over 30 books on logic, science, and philosophy, a summation of much of ancient learning.	**Panini**, great scholar of India, compiled a grammar of Sanskrit in nearly 4,000 poetic stanzas.
	He was followed by **Theophrastus**, who wrote on plants, minerals, and some "characters," or witty descriptions of people, a model for many later authors.	India was still given to writing comments on the ancient philosophers.
	Epicurus (d. 270) wrote scores of books and founded a school based on happiness, but little of his work has survived.	Cuneiform records of Persia now made on stone, and on tablets of gold and silver.
300	**Callimachus** of Alexandria wrote six hymns, and **Rhianus** of Crete was another noted poet. Of many others, **Bion** and **Moschus** are known for their pastoral elegies, following their master **Theocritus**, leader in this form. Bion's "Lament for Adonis," in memory of Moschus, was Shelley's model for his "Adonais."	The Ptolemies established a library of 700,000 scrolls at Alexandria, Egypt, the seat of learning. Euclid lived there for a time. The Greek poet, **Callimachus**, made the library catalog in 120 sections or books.
	Euclid at Alexandria wrote on science and geometry, such as his "Elements," "Data," "Optics," and "Division of the Scale." **Eratosthenes**, also at Alexandria, later wrote on geography and astronomy. **Aratus** made an epic on astronomy.	**Manetho**, during the reign of Ptolemy II, wrote in Greek a chronology of Egypt, but only a partial list of kings and some fragments remain.
	The "Argonautica," an epic by **Apollonius of Rhodes**, broke away from the style and doctrines of Callimachus about 250 B. C.	"Septuagint," earliest known translation of the Hebrew Testament into Greek, was made by 72 scholars sent from Jerusalem to Alexandria.
200	Of the 40 books of history by **Polybius**, only 5 survive, with fragments of 18 others. He wrote Greek history for the Romans to read.	About this time the two great epics of India took final form. They are the "Mahabharata," 20,000 lines describing heroes of the west and their acts and the "Ramayana," celebrating the great warrior of the east in 48,000 lines.
	The library at Pergamon in Asia rivaled that at Alexandria. Anthony gave 200,000 volumes from it to Cleopatra for the collection at Alexandria. Criticism flourished at Pergamon; so did **Antigonus**, philosopher and naturalist.	INDIA, EGYPT, PERSIA, CHINA
	Nicander of Colophon wrote two long medical poems.	**Patanjali** made further comments on the Vedic texts. In his "Yoga Sutras" he introduced the idea of union (**yoga**) with a Supreme Being. Somewhat before him, possibly in the 3rd century, in his "Vartikhas," **Katyayana** had explained the grammar of Panini.
100	**Strabo's** "Geography" in 17 books, a sequel to Polybius. After 20 B. C. he lived at Rome for some years.	
	"Library of History" in 40 books (of which we have 1-5, 11-20, and fragments) by **Diodorus of Sicily** brought universal history down to Caesar. **Dionysius of Halicarnasus** described the grandeur of Rome and sought to revive great classic Greek prose. He was also a famous critic. His essay "On the Arrangement of Words" is helpful today as it was to his Roman pupils.	"Shih Chi" by **Ssu-ma Ch'ien** of China, about 100 B. C., compiled a great history in 5 parts: Annals of Reigns, Tables of Dates, Monographs, Annals of Subject Princes, Biographies. His work was the model for many later histories. In 1747 his "Shih Chi" was translated in 219 volumes.
A. D.		
100	**Flavius Josephus**, a Jewish scholar, wrote "History of the Jewish War" in Hebrew, but learned Greek to translate this for Hellenic readers. Later historians were **Arrian** (cir. 95-175), a desciple of Epictetus, who covered 336-323 B. C. in an account of the age of Alexander the Great. **Appian**, his contemporary, compiled an elaborate history of Rome in the manner of Polybius, but free from rhetorical flourishes.	**Wang Chung** (27-97 A. D.), an independent philosopher, taught a new form of Confucianism.
	The teachings of **Epictetus**, in 12 books, were compiled by Arrian.	**Hsu Chen** (d. about 120 A.D.), made a dictionary of Chinese characters according to 540 radicals or types.
	Pausanias made a guide book to Greece, in 10 books, which are of great value today to travelers.	
	"Parallel Lives" of famous Greeks and Romans by **Plutarch** gives us much of our knowledge of famous men of classic times. Shakespeare drew heavily on North's translation from a French version of this Greek work.	
	Galen (Claudius Galenus) compiled treatises on medicine and philosophy, of which we have 83 today. **Ptolemy** (Claudius Ptolomaeus) developed the system of astronomy current till after the Middle Ages.	
	"On Hunting" by Oppian; "Sequel to the Iliad" by Quintus; "Dionysus" by Nonnus; "Hero and Leander" by Museus, borrowed in part by Marlowe in 1590, and various Greek anthologies represent the cream of later Greek poetry.	

B.C.	ROME.
200	Twenty out of 130 comic plays by **Titus Maccius Plautus** (about 254-184 B.C.), the greatest comic poet of ancient Rome.
	Fragments of the "Annals," a history by **Quintus Fabius Pictor** (about 254 B.C.), the first writer of Roman history in prose.
	Fragments of tragedies, comedies, satires, and "Annals," by **Quintus Ennius** (239-169 B.C.), "the father of the Roman epos."
	Fragments of several of the 150 orations and "De Agri Cultura," and "De Re Rustica," by **Marcus Porcius Cato**, known as Cato the Censor, Cato Major (Cato the Elder), or Cato Priscus (234-149 B.C.), a Roman statesman and orator.
	Six comedies by **Publius Terentius Afer** (known as Terence) (about 185 to about 159 B.C.).
	800 fragments of satires (the longest with only 13 verses) by **Gaius Lucilius**, the originator of Latin satirical composition (149-103 B.C.).
	750 lines, fragments of 40 tragedies written by **Lucius Attius** or **Accius** (about 170-90 B.C.), perhaps the greatest of the Roman tragic writers.
100	"De Re Rustica Libri III," the most important treatise on ancient agriculture known to us; "De Lingua Latina," a grammatical work originally in 24 books—of which we have 6 by **Varro** (Marcus Terentius), "the most learned of the Romans" (116-27 B.C.)
	Fifty-seven orations, the most famous being the four against Catiline, the fourteen philippics against Antony, the orations on behalf of L. Murena and Marcus Cælius; his treatises including "De Senectute" (concerning Old Age), "De Amicitia" (concerning Friendship), and others by **Cicero** (Marcus Tullius), Rome's greatest orator and an illustrious man of letters and statesman (106-43 B.C.).
	"Commentaries on the Gallic and Civil Wars" by **Cæsar** (Gaius Julius), one of the most remarkable men of all time (100-44 B.C.).
	"De Rerum Natura," a poem in six books, 7,500 lines, by **Lucretius** (Titus Lucretius Carus) (about 99 to about 55 B.C.), a Roman poet of the first rank.
	Twenty-five biographies of warriors and statesmen, mostly Greeks, by **Nepos** (Cornelius), a Roman historian (about 99 to about 24 B.C.).
	116 poems by **Catullus** (Gaius Valerius), the greatest of the Roman lyric poets (about 87 to about 54 B.C.).
	"Catilinia," or "Bellum Catilinarium," descriptive of Catiline's Conspiracy in 63 B.C.; "Jugurtha," describing the Jugurthine War, by **Sallust** (Gaius Sallustius Crispus), a Roman historian (86-34 B.C.).
	The "Æneid," or wanderings of Æneas after the siege of Troy; ten "Eclogues" or "Bucolics," the "Georgics," by **Vergil** (Publius Vergilius Maro), one of the most celebrated of Roman poets (70-19 B.C.).
	"Odes," "Epistles," "Satires," "Liber de Arte Poetica" ("Art of Poetry"), by **Horace** (Quintus Horatius Flaccus), the greatest Latin poet of his time after Vergil (65-8 B.C.).
A.D.	"History of Rome" in 142 books of which 35 have come down to us, by **Livy** (Titus Livius Patavinus), the great Roman historian (59 B.C.-17 A.D.).
	"Epistles" on moral subjects and philosophical treatises; ten tragedies and "Satires," by **Seneca** (Lucius Annæus), or Seneca the Elder (about 4 B.C. to about 65 A.D.).
	"Metamorphoses," a treatise on all the transformations recorded in legend from the Creation to the time of Julius Cæsar; the "Heroides" and several other poems, by **Ovid** (Publius Ovidius Naso) (43 B.C.-18 A.D.).
	"Historia Naturalis," comprising all the natural sciences, divided into 37 books on 20,000 subjects by **Pliny the Elder** (Gaius Plinius Secundus) (23-79).
	"Epigrammata" in 14 books, by **Martial** (Marcus Valerius Martialis), the first of the Roman epigrammatists (about 40 to about 104).
	"Annals" and histories by **Tacitus** (Publius Cornelius Tacitus), an important historian of Rome (about 55-117).
100	Sixteen "Satires" by **Juvenal** (Decius Junius Juvenalis), a satirist of indignation, well translated by Dryden and others (38-120).
	"Epistulæ," or ten books of letters; "Panegyricus," an adulation of the Emperor Trajan, by **Pliny the Younger** (Gaius Plinius Cæcilius Secundus), a nephew of Pliny the Elder (62-110).
	"Lives of the Cæsars," "Lives of Eminent Grammarians," "Lives of Eminent Rhetoricians," by **Suetonius Tranquillus** (75 to about 160), an eminent historian of Rome.
	Two "Apologies for the Christians," "Dialogue with Tryphon the Jew," by **Justin Martyr** (about 100 to about 165), a Christian writer and philosopher.
	"Institutes," and other legal works of **Gaius the Jurist** (about 110 to about 180). From these 535 extracts were taken for the "Institutes" of Justinian. Gaius is the chief source of our knowledge of Roman law.
	"Apologia," "Metamorphoses," or the "Golden Ass," a novel or romance, by **Lucius Apuleius**, a satirist of Rome (born about 125).
	"Proscription of Heretics," "Apology to the Nations," "Against the Jews," "Against Marcion," "Against the Valentinians," "Against Praxeas," and many tracts on morals and church discipline by **Tertullian** (Quintus Septimius Florens Tertullianus), one of the earliest of the Latin Church Fathers (about 150 to about 230).

A. D.	LATER LATIN AND GREEK WRITERS.
100	"Dialogues of the Gods," "Dialogues of the Dead," "Auction of Philosophers," "Timon," and the "Veracious History," by **Lucian of Samosata** (about 120-about 200), a famous satirist and humorist.
	"Against Heresies," a valuable history of doctrine and fragments of other theological works, by **Saint Irenæus** (about 130-202), one of the leading Church fathers of the West.
	"Exhortation to the Greeks," the "Instructor," "Stromata" or miscellanies, by **Clement of Alexandria** (Titus Flavius Clemens, about 150-about 215), a celebrated Greek father of the Church.
	Rhetorical treatises by **Hermogenes** (second half of the second century), the greatest technologist of his times.
to	A Roman history (180-238) by **Herodianus**, a Greek resident in Italy; born about 170; died about 240. "Hexapla," "Tomoi," "De Principiis," "Against Celsus," by **Origen** (about 185-254), called also **Adamantius**, the most famous Christian writer of the third century.
	Lives of the Greek philosophers in 10 books, very valuable, by **Diogenes Laertius**, who lived about 200.
	Eighty-two letters, and treatises on "Unity of the Church," "Dress of Virgins," "Lapsed," "Lord's Prayer," "Vanity of Idols," "Against the Jews," and other very instructive works, by **Saint Cyprian** (Thascius Cæcilius Cyprianus, about 200-258), the great leader, as Bishop of Carthage, of the African Church.
	"Enneads," philosophical works, by **Plotinus** (204-270).
200	Works of criticism and philosophy (and, perhaps, the essay "On Sublimity") by **Longinus** (210-273), tutor at the court of Zenobia.
	"Against the Christians" (15 books), "Life of Plotinus," "Life of Pythagoras," "On Aristotle," by **Porphyry** (about 233-about 305), a teacher of philosophy at Rome.
	Autobiography, letters, and numerous philosophyical works, orations, and declamations, by **Libanius** (born about 314), the best known sophist of the fourth century.
	"Life of Pythagoras," "Exhortation to Philosophy," and many mathematical and philosophical works, by **Iamblichus** (died about 330).
	Six volumes of theological works by **Saint Ambrose** (about 340-397), Bishop of Milan, and one of the most celebrated of the ancient fathers of the Church, one of the four doctors of the Western Church.
	"Translation of the Bible," the best up to its time. "Illustrious Men," more than one hundred "Letters" and "Epistles," by **Saint Jerome** (Hieronymus, about 340-420), the most learned of the early fathers of the Roman Church.
	Ten books of "Letters" and the fragments of nine orations by **Symmachus** (Quintus Aurelius, about 345-about 405), a distinguished Roman orator, scholar, and statesman.
	CONTINENTAL EUROPE
300	Bishop Ulfilas translated the Bible into his native Gothic. He introduced Christianity to his people. His translation is the oldest specimen of Germanic literature that has come to our age. The Gothic Bible was written in silver letters on purple parchment. The volume is now in the library of the University of Upsala, Sweden.
500	Migration of tribes from northern Europe gave rise to homely sagas which made the basis for later epic poems.
600	From this century some fragments of poetry, monkish literature, and a little prose remain, but they are of little worth.
700	"Merseberg Charms," "Wessobrunn Prayer," and "Muspilli," a picture of the Last Day, belong to this century or a bit later.
800	French literature begins with the text of an oath taken in 842 by Louis and Charles, grandsons of Charlemagne, to dethrone their brother Lothaire, whom they had beaten in battle.
	Latin continued to be the medium of religious, scientific, and court literature. Lyric poetry and native drama from this age have not come down to us. One interesting religious poem, "The Heliad," founded on the Gospels, may have been written at the request of Louis the Pious, youngest son of Charlemagne.
	"Lay of Hildebrand," a Saxon poem, described the duel between Hildebrand and his son, after years of separation, not knowing each other. "Ludwigslied" (dating from about 881), the earliest German historical ballad, celebrates the victories of Louis III over his enemies.
900	From 800 on various epic fragments were developed. In the ninth and tenth centuries, they became well known. Charlemagne was the center of many hero tales. These finally culminated in the epic "Song of Roland," which describes the death of a French hero at Roncesvalles in the Pyrenees, with the revenge taken by Charlemagne on the enemies of Roland.
1000	About this time German translations were made of Boethius, Aristotle, and Latin works of former times. The "Consolations of Philosophy" by Boethius became famous, and Aristotle's idea colored all later thought.
	Various cycles developed in France in this age of troubadours. The chief ones are:
	(1) "Cycle de France" made up of the Roland story and related tales.

A. D.	LATER LATIN AND GREEK WRITERS.
200	"Daily Rounds, or Cathamerinon," a collection of twelve lengthy hymns: "The Soul's Conflict. or Psychomachia," or religious allegories; "The Crowns, or Peri Stephanion," fourteen hymns in praise of martyrs; two books "Against Symmachus"; and more poems, by **Prudentius** (Aurelius Clemens Prudentius, 348-about 405), the greatest Christian poet of the early Latin Church.
to	"Confessions," an autobiography; "City of God," in 22 books; "Retractions"; 270 "Epistles" and numerous treatises by **Saint Augustine** (354-430), Bishop of Hippo in northern Africa, the greatest of the Latin fathers, and most celebrated of the four doctors of the Western Church.
400	Nine books of "Letters" of great value; twenty-four poems by **Apollinaris Sidonius** (430-487), Roman author, political leader, and Bishop of Clermont.

	ENGLAND	ASIA
300	Traditions of songs by bards who later gave way to Angles and Saxons.	
500	**Gildas** wrote history and letters in Latin. British consciousness developing. The scops or composers of verses and the gleemen or signers of popular songs are mentioned in this age. **Ethelbert**, king of Kent (d. about 616) left some native laws, our earliest prose nearly dated.	Early Arabian literature is varied and rich. Seven odes called "Moallakat," literally "the suspended," belong to the century ending about 600. Collected in 8th century. Chief authors: **Amru'ul-Qais**, of a noble house, said by some to be the greatest early poet; **Tarafa**, a literal poet; **Antara**, a black slave; **Labid**, the only one who turned to Islam.
600	"Beowulf," greatest epic of early Germanic people, may date here or later. It is a poem of 3183 lines celebrating the overcoming of Grendal and his mother by a hero imported from north Germany. May not be an English but north Europe product. **Caedmon's** "Creation" and a "Hymn" written before 700. Fragment of the "Hymn" is quoted by Bede. Other early poetry "Battle of Maldon" "Battle of Brunanburgh," "Waldhere" "Deor's Complaint," "The Seafarer," are other early poems, not later than the 10th century.	Two groups of fragments, two to 20 lines each, contain praises of the tribes, accounts of journeys, elegies (some by women), and various other occasional types. The **Koran**, or bible of Islam, compiled mainly by the secretary of Mohammed after his death. It has 114 suras or chapters, 77,639 words, instructing the faithful in their worship.
700	**Aldhelm**, before 700, wrote various ecclesiastical works. **Beda** or **Bede** (d. 735) compiled in Latin "The Six Ages of the World," "Ecclesiastical History," and other works now lost. **Alcuin** (d. 804), is known for his scholarly works of various kinds. **Cynewulf** (d. 825) greatest poet of Old English times, excepting the "Beowulf." His works appear in the Exeter and Vercelli books of the 11th century. They are the "Elene," "Juliana," "The Ascension"; perhaps the "Christ," "Phoenix" and "Andreas," the last a noble work. "Dream of the Rood" seems earlier.	Science, grammar, and biography highly developed. **Abu Hanifah**, a church father, compiled a code of laws. The "Al Muwatta" code, later collected by **Malik ibn Anas**, standard in Mohammedan lands until today. **Azraqi's** "History of Mecca" a fine work. **Ibn Ishaq**, in his biography of Mohammed, began history in Arabia, before 750. **Ibn Muqaffa** (d. 760) translated the "Fables of Bidpai," still regarded as a world classic. This work has many entertaining moralized tales. **Abu-Tammam** compiled the "Al-Hamasa" in 10 books, 884 poems in all, made up of all previous publications.
800	**Nennius** wrote in Latin a "Historia Brithonum" in 8 parts. Contains legends and some fact. "The Anglo-Saxon Chronicle," a record of events, with many gaps, kept evidently by monks and coming down to the time of Alfred. Our best source for early English history. **Alfred the Great** (871-901) made the West Saxon dialect supreme. Under his direction many scholars labored for years. The chief results are translations of Boethius, Orosius, Bede, and other old authors. The court also compiled laws and records.	Biographies of Mohammed, **Al-Farghani's** "Cyclopedia of Astronomy," codes of laws and traditions, **Abu Ubaidah's** 105 monographs on history are the chief prose works of this age. Great Arabian histories before 925 by **Ya'qubi**, "Handbook of History" by **Ibn Qutaiba**, and **Baladhuri's** "Arab Conquests" of high repute today. **Abu Jafar-al-Tabari**, a Persian, compiled a universal history, the earliest of its type. He later wrote a comment on the "Koran."
900	**Ælfric's** "Homilies" represent this century. He made a Latin Grammar and wrote a "Colloquium."	Persia leads in literature. Some great works: **Rudaki's** translation of Bidpai; **Daqiqi's** poetical history of Iran or Persia; **Altarabi's** "Philosophy" studied in Europe in the Middle Ages.
1000	Old English fast breaking down, and Latin the medium of scholars and the church. After 1066, Norman French greatly influenced English.	**Firdausi's** "Book of Kings" a great work of world literature. He and **Mutanabbi** among the noblest poets, still widely read.

A. D.	GERMANY.	FRANCE.
1100	"Rolandslied," descriptive of Roland at Roncesvalles and of Charlemagne. "Alexanderlied," on the deeds of Alexander. Both epic poems by unknown authors prior to 1130. "Tagelieder" (Dawn-songs), "Parzival," the basis of Wagner's "Parsifal, Story of the Holy Grail"; by **Wolfram von Eschenbach** (about 1165 to about 1220). "Kreuzlied," in celebration of the Crusade of Frederick II., by **Walther von der Vogelweide** (about 1165 to about 1230), a Middle High German minnesinger. Peasant lyrics, forerunners of the Volkslied, by **Neidhart von Reuenthal** (about 1180 to about 1240).	(2) "Cycle de Brétagne." The chief poet is **Chrétien de Troyes.** The motive is love. It deals with the search for the Holy Grail, King Arthur and the Round Table, the romance of "Tristan and Iseut." In this cycle are "Lays of Bretagne," by **Marie de France,** the earliest French poet. Poem of 2,300 lines on St. Patrick's Purgatory, animal fables called "Ysopet"; the "Lais" of 14 narrative poems each from 100 to 1,200 lines; loves of "Tristan and Iseut"; "Eliduc"; "Le rossignol" (the nightingale); "Les deux amants"; "Yonec," a fairy tale of the bluebird and Lanval, by **Marie de France.** (3) "Cycle Antique" deals with the ancient heroes of Greece and Rome; the "Roman d'Alexandre" with 12,000 verses of 12 syllables, by **Alexandre de Bernay** (twelfth century), the "Roman de Thebes," and the "Roman de Troie," by **Benoist de Sainte-Maure,** "Roman de Rou, et des ducs de Normandie," by **Wace** (1100-1175). "Conquête de Constantinople" and particulars of the Fourth Crusade, by **Geoffroi de Villehardouin** (1155-1213).
1200	"Tristan and Isolde," the subject of Wagner's opera, a poem in 19,552 verses, by **Gottfried von Strasburg** (about 1200). "Nibelungenlied" (Song of the Nibelungs). A great High German epic, by an unknown poet at the beginning of the thirteenth century. Ten complete manuscripts are known. The Iliad of Germany. "Gudrun," chief of the Low German epic sagas, preserved in a High German poem, by an unknown author, at the beginning of the thirteenth century. The Odyssey of Germany. "Eneit," by **Heinrich von Veldeke,** father of Middle High German courtly poetry. "Sermons," by **Berthold von Regensburg,** a German Franciscan preacher (about 1220-1272). "Poems," mainly mocking and sensuous, excepting one, "Penitential Ode" by **Tannhauser,** a German knight and minnesinger (died about 1270). Sermons and philosophical works by **Johannes Eckhart** or **Eckhardt,** a mystic and reformer (about 1260-1327). "Autobiography," "Book of Everlasting Wisdom," and poems, by **Heinrich Suso** or **Seuse,** a German mystic (about 1295-1366).	Lyric poems, by **Thibaut,** Count of Champagne and King of Navarre (1201-1253). "Le roman du Renart" of 32,000 verses of satires. "Le roman de la rose," by **Guillaume de Lorris** (about 1215 to about 1240), of 4,000 verses, left unfinished. An addition of 18,000 verses in an entirely different vein was made by **Jean de Meun** in 1277. There are over 300 MSS. of this extant. "Histoire de St. Louis" (Louis IX.), "Credo," by **Jean de Joinville** (1225-1317). Lyric poems, by **Colin Musset,** a wandering minstrel (about 1250). "Le miracle de Théophile," a miracle play; numerous satirical poems, by **Ruteboeuf;** real name unknown. Mass sung at the coronation of Charles V. (1364); collection of poems; by **Guillaume de Machault** or **Machaut** (about 1284-1370), a poet and musician.

	ENGLAND.	FRANCE.
1300	**John Wiclif** (about 1320-1384). Two treatises, "Concerning Human Lordship," and "Concerning the Lordship of the Church," and a translation of the Bible into English. **John Gower** (1325-1408). Poems. **William Langland** (about 1332-1400?). The greatest poet of the century excepting Chaucer. "Piers Plowman," an allegorical poem descriptive of human life. **Geoffrey Chaucer** (about 1340-1400). The first great English poet. "Legende of Good Women," "Troylus and Crysede," "The House of Fame," "Palamon and Arcite," and "Canterbury Tales." **James I.** of Scotland (1394-1437). Poems.	"Chroniques," or Chronicles in four books of history; poems: "The Little Thane of Love," "Meliador," a lengthy poem on chivalry and legend, by **Jean Froissart** (about 1338-1410). "De l'art de dicter," by **Eustache Deschamps** (about 1350). "Oeuvres poétiques," "Life of Charles V.," by **Christine de Pisan** (about 1363-1431). "Miroir de mariage," of 13,000 lines; ballad to Chaucer. "History of Charles VII.," "Bréviaire des Seigneurs," "Lay de la belle dame sans merci," and other lovers' poems, by **Alain Chartier** (about 1390-1440). Poems of Love and Spring, written during twenty-five years' imprisonment in England, by **Charles of Orleans,** father of Louis XII. of France (1391-1465). The last of the French mediæval poets.
1400	**William Caxton** (1412-1492). "The Game and Playe of the Chesse." **William Dunbar** (1460-1530?). Poems. **William Tyndale** (1484-1536). Translation of the Bible. **Miles Coverdale** (1488-1568). Translation of the Bible. **Sir David Lindsay** (1490-1557). Poems and comedy. **Hugh Latimer** (1491-1555). Sermons.	"Poems," "Le petit testament," "Le grand testament," a "Codicille" of ballads, "Le jargon," a "Dialogue," and a "Monologue," "Le franc archier de Bagnolit," by **Francois Villon** (1431-1484). "L'avocat Panthelin," first masterpiece of French comic theater, author unknown (about 1475). "Mémoires," a complete political review of the times, by **Philippe de Comines** (1445-1509). "Prognostication Pantagrueline," "Gargantua," "Pantagruel," by **Francois Rabelais** (1495-1553). "Letters," "Poems," "Marguerites de la marguerite," "Dernières poésies," and parts of the "Heptaméron" by **Marguerite of Navarre** (1492-1549). Collection of fables, epistles, epigrams, and songs, by **Clement Marot** (1495-1544).

A. D.	ENGLAND.	PERSIA, ARABIA, ETC.
1100	"Ormulum," a paraphrase of scripture, by **Orm** (1187-1237).	Astronomical tables, reforming the calendar; a treatise on algebra—extracting the square and cube roots, on cubic equations, and on expanding a binomial; three books on natural science and three on metaphysics; the Rubaiyat (rhymed quatrains, translated by Edward Fitzgerald), by **Omar Khayyam** (about 1045-1123). NOBEL PRIZES FOR LITERATURE.

Alfred B. Nobel of Sweden, inventor of dynamite, who died on Dec. 10, 1896, left about $9,000,000, of which the interest is annually awarded to those who have done most to benefit mankind. The Nobel prizes have been divided into five classes,—awards for physics, chemistry, physiology and medicine, literature, and peace. In each group about $40,000 is given annually to one or more persons.

The Nobel Prizes for Literature, since the first awards in 1901, have gone to these persons: Sully Prudhomme, French, 1901; Theodor Mommsen, German, 1902; Bjornstierne Bjornson, Norwegian, 1903; Frederic Mistral, French and Jose Echegaray, Spanish, 1904; Henryk Sienkiewicz, Polish, 1905; Giosue Carducci, Italian, 1907; Rudyard Kipling, English, 1908; Rudolf Eucken, German 1908; Selma Lagerlof, Swedish, 1909; Paul Heyse, German, 1910; Maurice Maeterlinck, Belgian, 1911; Gerhardt Hauptmann, German, 1912; Rabindranath Tagore, Bengalian, 1913; not awarded, 1914; Romain Rolland, French, 1915; Verner von Heidenstam, Swedish, 1916; Karl Gjellerup and Henrik Pontoppidan, both Danish, 1917; not awarded, 1918; Carl Spitteler, Swiss, 1919; Knut Hamsun, Norwegian, 1920; Anatole France, French, 1921; Jacinto Benevente, Spanish, 1922; William Butler Yeats, Irish, 1923; Vladislav St. Reymont, Polish, 1924; George Bernard Shaw, English, 1925; Signora Grazia Deledda, Italian, 1926; Henri Bergson, French, 1927; Mrs. Sigrid Undset, Norwegian, 1928; Thomas Mann, German, 1929; Sinclair Lewis, American, 1930; Erik Axel Karlfeldt, Swedish, 1931; John Galsworthy, English, 1932; Ivan Bunin, Russian, 1933; Luigi Pirandello, Italian, 1934; no award, 1935; Eugene O'Neill, American, 1936; Roger M. du Gard, French, 1937; Pearl Buck, American, 1938; Eemil Sillanpaa, Finnish, 1939.

ITALY, SPAIN, AND PORTUGAL.

Alfredo Panzini (1863-). Italian novelist. "La Fiabe della Virtu," "La Lanterna Diogene."

Arturo Farinelli (1867-). Italian critic. "Il Romanticismo in Germania," "Petrarcha in Deutschland."

Luigi Pirandello (1867-). Italian man of letters. "Elegie Renan," "Beffe della morte e della vita," "Il fu Mattia Pascal," "Arte e scienza," "La Morsa," "Enrico IV."

Filippo T. Marinetti (1878-). Poet, painter. "Mafarka le futuriste," "Democrazia futurista," "Futurismo e fascismo."

Ramon del Valle-Indan (1870-). Spanish poet and novelist. "Flor de Santidad," "Las Marquesa Rosalinda," "Divinas Palabras."

Ramon Perez de Ayala (1881-). Spanish poet, critic, and diplomatist. "La Paz del Sendero," "El Sendero Andante," "Prometeo," "El Curondero de su Houra."

Juan R. Jimenez (1881-). Spanish poet. "Platero y yo," "Artas Tristes," "Elegias."

Pedro Salinas (1891-). Spanish essayist and poet. "Presagios," "Poema del Cid," "Vispera de Gozo."

Manuel Machado (1874-). Portuguese poet. "Alma," "El Mal Poema," "Iulianillo Valcacel," (with his brother Antonio).

Aquilino Ribeiro (1882-). Portuguese novelist. "A Via Sinuosa," "Filhas de Biblonia," "Estrada de Santiago."

SCANDINAVIA AND EASTERN EUROPE.

Kostes Palamas (1859-). Greek Poet. "The King's Flute," "The Grave," "The Twelve Lays of a Gipsy," "Five Syllables and the Pathetic Whispers."

Juhani Aho (1861-1921). Finnish novelist. "The Fortunes of Matthias," "The Old Man of Korpela," "Findland's Flag."

Fedor Sologub (1863-1927). Russian poet and dramatist. "The Little Demon," "The Sorcery of Death," "The Created Legend."

Eric A. Karlfeldt (1865-1931). Swedish poet. "Songs of Land and the Open," "Fridolin's Poetry," "Flora and Ballona."

Dmitri S. Merezhkovsky (1865-). Russian novelist and critic. "Eternal Companions," "Christ and Antichrist," "The Birth of the Gods," "Akhnaton."

Wladislas S. Reymont (1867-1925). Polish novelist. "Lily," "The Promised Land," "From a Diary," "The Peasants."

Johan Bojer (1872-). Norwegian novelist and dramatist. "The Power of a Lie," "The Great Hunger," "Last of the Vikings," "Brutus."

Johannes V. Jensen (1874-). Danish man of letters. "The Gothic Renaissance," "Stories from Himmerland," "The Long Journey," "History of the Northern Races."

Alexander A. Block (1880-1921). Russian poet and playwright. "The Unexpected Joy," "Snow-mask," "Night Watches," "The Twelve."

Sigrid Undset (1882-). Norwegian novelist. "Jenny," "Kristin," "Lavransdatter," "Olav Audunsson."

Michael Babits (1883-). Hungarian poet. "Kartyavar," "Karacsonyi," and translations of Dante, Shakespeare, and Baudelaire.

UNITED STATES AND CANADA.

Edward Arlington Robinson (1869-1935). Poet. "Captain Craig," "The Man Who Died Twice," "Sonnets," "Collected Poems."

Theodore Dreiser (1871-). Novelist. "The Financier," "An American Tragedy," "Twelve Men." Also poetry, drama, and prose.

Amy Lowell (1874-1925). Poet and critic. "Pictures of the Floating World," "Ballads for Sale," "Six French Poets," "John Keats."

Robert Frost (1875-). Poet. "North of Boston," "Selected Poems," "West-Running Brook."

Percy MacKaye (1875-). Poet and Dramatist. "Jeanne d'Arc," "Scarecrow," "Caliban," "This Fine-Pretty World," "Canterbury Pilgrims."

Vachel Lindsay (1879-1931). Poet. "General Booth Enters into Heaven," "The Chinese Nightengale," "Golden Whales of California," "Johnny Appleseed."

Carl Sandburg (1878-). Poet. "Chicago Poems," "Slabs of the Sunburnt West," "Good Morning, America," "Abraham Lincoln" (biography).

Dorothy Canfield Fisher (1879-). Novelist, writer on education. "Brimming Cup," "Rough-Hewn," "Hillsboro People," "Her Son's Wife."

Joseph Hergesheimer (1880-). Novelist. "Java Head," "The Three Black Pennys," "Cytherea," "Quiet Cities."

Sinclair Lewis (1885-). Novelist. "Main Street," "Babbitt," "Elmer Gantry," "Dodsworth."

Eugene O'Neill (1888-). Dramatist. "Gold," "The Moon of the Caribees," "Emperor Jones," "Hairy Ape," "Strange Interlude."

Sidney Howard (1891-1939). Dramatist. "Swords," "They Knew What they Wanted," "Lucky Sam McCarver," "Silver Cord."

Stephen Leacock (1869-). Canadian economic and humorous writer. "Unsolved Riddle of Social Justice," "Nonsense Novels," "Moonbeams from the Larger Lunacy."

Lucy M. Montgomery (1877-). Canadian novelist. "Anne of Green Gables," "Anne's House of Dreams," "Emily of New Moon."

Albert Lozeon (1878-1924). Canadian poet writing in French. "Le Miroir des Jours," "Les Images du Pays."

Marjorie Pickthall (1883-1922). Canadian poet. "The Drift of Pinions," "The Lamp of Poor Souls," "The Wood-Carver's Wife," Angels' Shoes (stories).

MEMBERS OF THE FRENCH ACADEMY.

Perhaps the most distinguished honorary society in the world is the French Academy. It was founded by Cardinal Richelieu in 1635. There are 40 members elected for life, often called the Forty Immortals. The membership in 1939, in order of election was as follows: Gabriel Hanotaux, 1897; Henri Emile Lavedan, 1898; Maurice Donnay, 1907; Marcel Prévost, 1909; Henri Bergson, 1914; Alfred Baudrillart, 1918; Henri Bordeaux, 1919; André Chevrillon, 1920; Georges Goyau, 1922 (died, 1939); Edouard Estaunié, 1923; Georges Lecomte, 1924; Émile Picard, 1924; Louis Bertrand, 1925; Auguste De Caumont, Duc de la Force, 1925; Paul Valéry, 1925; Abel Hermant, 1927, Émile Mâle, 1927; Louis Madelin, 1927; Maurice Paléologue, 1928; Marshal Pétain, 1929; J. H. André Chaumeix, 1930; Maxime Weygand, 1931; Pierre Benoit, 1931; Abel Bonnard, 1932; François Mauriac, 1933; Duc de Broglie, 1934; Marshal Franchet d'Espérey, 1934; Léon Bérard, 1934; Claude Farrère, 1935; André Bellessort, 1935; Georges Duhamel, 1935; Louis Gillet, 1935; Edmond Jaloux, 1936; Joseph de Pesquidoux, 1936; Lucien Lacaze, 1936; George Grente, 1936; Jacques de Lacretelle, 1936; Charles Maurras, 1938; André Maurois, 1938; Jerome Tharaud, 1938.

SCENES IMMORTALIZED IN WRITING—II

1 "House of the Seven Gables," Salem, Mass., scene of Hawthorne's now famous classic.
2 "Evangeline's Well," Nova Scotia, topic of Longfellow's masterpiece.
3 "Snowbound," Home of Whittier, Haverhill, Mass.

A DICTIONARY OF MYTHOLOGY.

A'BAS. A king of Argos, son of Lynceus and Hypermnestra, grandson of Danaüs, father of Acrisius, and grandfather of Perseus.

ABSYR'TUS. Brother of Medea.

ACHELO'US. A son of Oceanus and Terra. He had the power of assuming all shapes, and in a conflict with Hercules he turned himself into a serpent, and then into a bull, but he was finally defeated, and he then turned himself into a river, which has since been called Achelous.

ACH'ERON. One of the rivers of the infernal regions to which the spirits of the dead resorted, and waited there till Charon the ferryman took them over.

ACHIL'LES. The most valiant of the Greek heroes in the Trojan War. He was the son of Peleus, king of Thessaly. His mother, Thetis, plunged him, when an infant, into the Stygian pool, which made him invulnerable wherever the waters had washed him; but the heel by which he was held was not wetted, and that part remained vulnerable. He was shot with an arrow in the heel by Paris, at the siege of Troy, and died of his wound.

ACIDA'LIA. A name given to Venus, from a fountain in Boeotia.

A'CIS. A Sicilian shepherd, loved by the nymph Galatea. One of the Cyclops who was jealous of him crushed him by hurling a rock on him. Galatea turned his blood into a river—the Acis at the foot of Mount Etna.

ACTAE'ON. The son of Aristaeus, a famous huntsman. He intruded himself on Diana while she was bathing, and was changed by her into a deer, in which form he was hunted by his own dogs and torn in pieces.

ADO'NIS. The beautiful attendant of Venus, who held her train. He was killed by a boar, and from his blood sprang the anemone.

ADRASTAE'A. Another name of Nemesis, one of the goddesses of justice.

ADSCRIPTI'TII DII. The gods of the second grade.

AE'ACUS. Son of Jupiter and Aegina; one of the judges of the infernal regions, who was appointed to judge the Europeans.

AECAS'TOR. An oath used only by women, referring to the Temple of Castor.

AED'EPOL. An oath used by both men and women, referring to the Temple of Pollux.

AEGE'ON. A giant with 50 heads and 100 hands, who was imprisoned by Jupiter under Mount Etna.

AEGIP'ANS. Rural deities who inhabited the forests and mountains, the upper half of the body being like that of a man, and the lower half like that of a goat.

AE'GIS. The shield of Jupiter, so called because it was made of goat skin; used as a defensive armor in his war with the Titans; afterwards intrusted by him to Minerva.

AE'GLE. The fairest of the Naiads.

AEL'LO. The name of one of the Harpies.

AENE'AS. The son of Anchises and Venus. He was one of the few great captains who escaped the destruction of Troy. He behaved with great valor during the siege, encountering Diomed, and even Achilles himself. When the Grecians had set the city on fire Aeneas took his aged father, Anchises, on his shoulders, while his son, Ascanius, and his wife, Creusa, clung to his garments. He saved them all from the flames. After wandering about during several years, encountering numerous difficulties, he at length arrived in Italy, where he was hospitably received by Latinus, king of the Latins. After the death of Latinus, Aeneas became king.

AE'OLUS. The god of the winds. Jupiter was his reputed father, and his mother is said to have been a daughter of Hippotus.

AESCULA'PIUS. The god of physic, was a son of Apollo. He was physician to the Argonauts in their famous expedition to Colchis.

AE'SON. Father of Jason, and was restored to youth by Medea.

AE'TES. A king of Colchis, was father of Medea.

AGAMEM'NON. The son of Plisthenes and brother of Menelaus. He was king of the Argives. His brother's wife was the famous Helen, daughter of Tyndarus, king of Sparta; and when she eloped with Paris, Agamemnon was appointed leader of the Greeks in their expedition against Troy.

AGANIP'PIDES. A name of the Muses, derived from the fountain of Aganippe.

AGLA'IA. One of the three Graces.

AG'NI. The Hindu god of fire.

A'JAX. One of the bravest of the Greek warriors in the Trojan War. His father was Telamon, and his mother Eriboea. Some writers say that he was killed by Ulysses; others aver that he was slain by Paris; while others again assert that he went mad after being defeated by Ulysses, and killed himself. Another Ajax, son of Oïleus, also took a prominent part in the Trojan War.

ALCES'TIS. Wife of Admetus, who, to save her husband's life, died in his stead, and was restored to life by Hercules.

ALCI'DES. One of the names of Hercules.

ALCME'NA. The mother of Hercules, was daughter of Electryon, a king of Argos.

ALEC'TO. One of the Furies. She is depicted as having serpents instead of hair on her head, and was supposed to breed pestilence wherever she went.

ALEC'TRYON. A servant of Mars, who was changed by him into a cock because he did not warn his master of the rising of the sun.

AL'FADUR. In Scandinavian mythology the Supreme Being—Father of all. One of the names of Odin.

AMAL'THAE'A. The goat which nourished Jupiter.

AM'AZONS. A nation of women-soldiers who lived in Scythia. Hercules totally defeated them, and gave Hippolyte, their queen, to Theseus for a wife. The race seems to have been exterminated after this battle.

AMBARVA'LIA. Festivals in honor of Ceres, instituted by Roman husbandmen to purge their fields. At the spring festival the head of each family led an animal, usually a pig or ram, decked with oak boughs, round his grounds, and offered milk and new wine. After harvest there was another festival, at which Ceres was presented with the first fruits of the season.

AMBRO'SIA. The food of the gods.

AMPHI'ON. The son of Jupiter and Antiope. He was greatly skilled in music; and it is said that, at the sound of his lute, the stones arranged themselves so regularly as to make the walls of the city of Thebes.

AMPHITRI'TE or **SALATIA.** The wife of Neptune, was a daughter of Nereus and Doris. She was the mother of Triton, a sea god.

AMY'CUS. King of Babrycia. He was a son of Neptune, and was killed by Pollux.

ANCAE'US. A son of Neptune, who left a cup of wine to hunt a wild boar, which killed him, and the wine was untasted. This was the origin of the proverb —"There 's many a slip 'twixt cup and lip."

ANCIL'IA. The 12 sacred shields. The first Ancile was supposed to have fallen from heaven in answer to the prayer of Numa Pompilius. It was kept with the greatest care, as it was prophesied that the fate of the Roman people would depend upon its preservation. An order of priesthood was established to take care of the Ancilia, and on March 1 of each year the shields were carried in procession, and in the evening there was a great feast called Coena Saliaris.

ANDROM'EDA. The daughter of Cepheus, king of the Ethiopians, was wife of Perseus, by whom she was rescued when she was chained to a rock and was about to be devoured by a sea monster.

ANEM'ONE. Venus changed Adonis into this flower.

ANGERO'NIA. Otherwise Volupia, was the goddess who had the power of dispelling anguish of mind.

ANNA PEREN'NA. One of the rural divinities.

ANTAE'US. A giant who was vanquished by Hercules. Each time that Hercules threw him the giant gained fresh strength from touching the earth, so Hercules lifted him off the ground and squeezed him to death.

AN'TEROS. One of the two Cupids, sons of Venus.

ANTIC'LEA. The mother of Ulysses.

ANTI'OPE. Daughter of Nycteus, king of Thebes, and mother, by Zeus, of Amphion and Zethus.

ANU'BIS or **HERMAN'UBIS.** "A god half a dog, a dog half a man." Called *Barker* by Vergil and other poets.

AON'IDES. A name of the Muses, from the country Aonia.

APH'RODI'TE. A Greek name of Venus.

A'PIS. A name given to Jupiter by the inhabitants of the Lower Nile. Also the miraculous ox, worshiped in Egypt.

A'PIS. King of Argivia. Afterwards called Serapis, the greatest god of the Egyptians.

APOL'LO. This famous god, sometime king of Arcadia, was the son of Jupiter and Latona. He was known by several names, but principally by the following: Sol (the sun); Cynthius, from the mountain called Cynthus in the Isle of Delos, and this same island being his native place obtained for him the name of Delius; Delphinius, from his occasionally assuming the shape of a dolphin. His name of Delphicus was derived

from his connection with the splendid Temple at Delphi, where he uttered the famous oracles. Some writers record that this oracle became dumb when Jesus Christ was born. Other common names of Apollo were Didymaeus, Nomius, Paean, and Phoebus. The Greeks called him Agineus because the streets were under his guardianship, and he was called Pythius from having killed the serpent Python. Apollo is usually represented as a handsome young man without beard, crowned with laurel, and having in one hand a bow, and in the other a lyre. The favorite residence of Apollo was on Mount Parnassus, a mountain of Phocis, in Greece, where he presided over the Muses. Apollo was the accredited father of several children, but the two most renowned were Aesculapius and Phaëton.

APOTHE'OSIS. The consecration of a god. The ceremony of deification.

ARACH'NE. A Lydian princess, who challenged Minerva to a spinning contest, but Minerva struck her on the head with a spindle, and turned her into a spider.

ARCA'DIA. A delightful country in the center of Peloponnesus, a favorite place of the gods. Apollo was reputed to have been king of Arcadia.

AR'CAS. A son of Calisto, was turned into a he-bear; and afterwards into the constellation called Ursa Minor.

AREOP'AGI'TAE. The judges who sat at the Areopagus.

AREOP'AGUS. The hill at Athens where Mars was tried for murder before 12 of the gods.

ARETHU'SA. Was one of the nymphs of Diana. She fled from Alpheus, a river god, and was enabled to escape by being turned by Diana into a rivulet which ran underground. She was as virtuous as she was beautiful.

AR'GONAUTS. This name was given to the 50 heroes who sailed to Colchis in the ship Argo under the command of Jason, to fetch the Golden Fleece.

AR'GUS. Was a god who had a hundred eyes which slept and watched by turns. He was charged by Juno to watch Io, but, being slain by Mercury, was changed by Juno into a peacock.

ARIAD'NE. Daughter of Minos, king of Crete. After enabling Theseus to get out of the labyrinth by means of a clew of thread, she fled with him to Naxos, where he ungratefully deserted her; but Bacchus wooed her and married her, and the crown of seven stars which he gave her was turned into a constellation.

ARI'ON. Was a famous lyric poet of Methymna, in the island of Lesbos; rescued from drowning by a dolphin.

ARISTAE'US. Son of Apollo and Cyrene, was the god of trees. He also taught mankind the use of honey, and how to get oil from olives. He was a celebrated hunter. His most famous son was Actaeon.

ARMA'TA. One of the names of Venus, given to her by Spartan women.

AR'TEMIS. This was the Grecian name of Diana, and the festivals at Delphi were called Artemesia.

ARUS'PICES. Sacrificial priests.

ASCAL'APHUS. Was changed into an owl, the harbinger of misfortune, by Ceres, because he informed Pluto that Proserpine had partaken of food in the infernal regions, and thus prevented her return to earth.

ASCA'NIUS. The son of Aeneas.

ASCOL'IA. Bacchanalian feasts, from a Greek word meaning a leather bottle. The bottles were used in the games to jump on.

ASO'PUS. A son of Jupiter, who was killed by one of his father's thunderbolts.

ASSABI'NUS. The Ethiopian name of Jupiter.

ASTAR'TE. One of the Eastern names of Venus.

ASTE'RIA. Daughter of Caeus, was carried away by Jupiter, who assumed the shape of an eagle.

ASTRE'A. Mother of Nemesis, was the goddess of justice. She returned to heaven when the earth became corrupt.

ATALAN'TA. Daughter of Caeneus. The oracle told her that marriage would be fatal to her, but, being very beautiful, she had many suitors. She was a very swift runner, and, to get rid of her admirers, she promised to marry any one of them who should outstrip her in a race, but that all who were defeated should be slain. Hippomenes, however, with the aid of Venus, was successful. That goddess gave him three golden apples, one of which he dropped whenever Atalanta caught up to him in the race. She stopped to pick them up, and he was victorious and married her. They were both afterwards turned into lions by Cybele, for profaning her temple.

A'TE. The goddess of revenge, also called the goddess of discord and all evil. She was banished from heaven by her father Jupiter.

ATHE'NA. A name obtained by Minerva as the tutelary goddess of Athens.

AT'LAS. King of Mauritania, now Morocco, in Africa. He was also a great astronomer. He is depicted with the globe on his back, his name signifying great toil or labor. For his inhospitality to Perseus that king changed him into the mountain which bears his name of Atlas. A chain of mountains in Africa is called after him, and so is the Atlantic Ocean.

AT'REUS. The type of fraternal hatred. His dislike of his brother Thyestes went to the extent of killing and roasting his nephews, and inviting their father to a feast, which Thyestes thought was a sign of reconciliation, but he was the victim of his brother's detestable cruelty.

AT'ROPOS. One of the three sisters called "The Fates," who held the shears ready to cut the thread of life.

A'TYS. Son of Croesus, was born dumb, but when in a fight he saw a soldier about to kill the king, he gained speech, and cried out, "Save the king!" and the string that held his tongue was broken.

A'TYS. A youth beloved by Aurora, and was slain by her father, but, according to Ovid, was afterwards turned into a pine tree.

AUG'AEAS. A king of Elis, the owner of the stable which Hercules cleansed after 3,000 oxen had been kept in it for 30 years. It was cleansed by turning the river Alpheus through it. Augaeas promised to give Hercules a tenth part of his cattle for his trouble, but, neglecting to keep his promise, Hercules shot him.

AU'GURY. This was a means adopted by the Romans for forming a judgment of futurity by the flight of birds, and the officiating priest was called an augur.

AURO'RA. The goddess of the morning, "whose rosy fingers ope the gates of day." She was daughter of Sol, the sun, and was the mother of the stars and winds.

AUS'TER. The south wind, a son of Jupiter.

AVER'NUS. A poisonous lake, referred to by poets as being at the entrance of the infernal regions, but it was really a lake in Campania, Italy.

AVERRUN'CUS DEUS. A Roman god, who could divert people from evil doing.

BA'AL. A god of the Phoenicians.

BA'AL-PE'OR. A Moabitish god, associated with licentiousness and obscenity. The modern name is Belphegor.

BACCHAN'TES. The priestesses of Bacchus.

BAC'CHUS. The god of wine, and the son of Jupiter and Semele. He is said to have married Ariadne, daughter of Minos, king of Crete, after she was deserted by Theseus. The most distinguished of his children is Hymen, the god of marriage.

BA'LIOS. A famous horse given by Neptune to Peleus as a wedding present, and afterwards given to Achilles.

BASSAR'IDES. The priestesses of Bacchus were sometimes so called.

BELISA'MA. A goddess of the Gauls. The name means the Queen of Heaven.

BELLER'OPHON. A hero who destroyed a monster called the Chimaera.

BELLO'NA. The goddess of war, and wife of Mars. The 24th of March was called Bellona's day, when her votaries cut themselves with knives and drank the blood of the sacrifice.

BE'LUS. The Chaldean name of the sun.

BERECYN'THIA. A name of Cybele, from a mountain where she was worshiped.

BI'FORMIS. A name of Bacchus, because he was accounted both bearded and beardless.

BO'NA DE'A. "The bountiful goddess," whose festival was celebrated by the Romans with much magnificence.

BO'NUS EVEN'TUS. The god of good success, a rural divinity.

BO'REAS. The north wind, son of Astraeus and Aurora.

BRAH'MA. The great Indian deity, represented with four heads looking to the four quarters of the globe.

BRIS'AEUS. A name of Bacchus, referring to the use of grapes and honey.

BRONT'ES. One of the Cyclops. He is the personification of a blacksmith.

BUBO'NA. Goddess of herdsmen, one of the rural divinities.

BUD'DHA. The founder of Buddhism; later supposed to be the manifestation of the Vishnu of the Hindus.

BYB'LIS. A niece of Sol, mentioned by Ovid. She shed so many tears for unrequited love that she was turned into a fountain.

CAB'IRI. The mysterious rites connected with the worship of these deities were so obscene that most

writers refer to them as secrets which it was unlawful to reveal.

CAC'ODAE'MON. Greek name of an evil spirit.

CA'CUS. A three-headed monster and robber.

CAD'MUS. One of the earliest of the Greek demi-gods. He was the reputed inventor of letters, and his alphabet consisted of 16 letters. It was Cadmus who slew the Boeotian dragon, and sowed its teeth in the ground, from each of which sprang up an armed man.

CADU'CEUS. The rod carried by Mercury. It has two winged serpents entwined round the top end. It was supposed to possess the power of producing sleep, and Milton refers to it in *Paradise Lost* as the "opiate rod."

CALLI'OPE. The Muse who presided over epic poetry and rhetoric. She is generally depicted using a stylus and wax tablets, the ancient writing materials.

CALLIS'TO. An Arcadian nymph, who was turned into a she-bear by Jupiter. In that form she was hunted by her son Arcas, who would have killed her had not Jupiter turned him into a he-bear. The nymph and her son form the constellations known as the Great Bear and Little Bear.

CAL'PE. One of the pillars of Hercules.

CALYP'SO. Queen of the island of Ogygia, on which Ulysses was wrecked, and where he was persuaded to remain seven years.

CA'MA. The Indian god of love and marriage.

CAMIL'LUS. A name of Mercury, from his office of minister to the gods.

CAN'ACHE. The name of one of Actaeon's hounds.

CANO'BA. The Indian Apollo.

CANO'PUS. The Egyptian god of water, the conqueror of fire.

CAP'IS or **CAP'ULA.** A peculiar cup with ears, used in drinking the health of the deities.

CAPITOLI'NUS. A name of Jupiter, from the Capitoline hill, on the top of which a temple was built and dedicated to him.

CAPRIP'EDES. Pan, the Aegipans, the Satyrs, and Fauns were so called from having goats' feet.

CASSAN'DRA. A daughter of Priam and Hecuba, who was granted by Apollo the power of seeing into futurity, but having offended that god he prevented people from believing her predictions.

CASSIOPE'IA. The Ethiopian queen who set her beauty in comparison with that of the Nereides, who thereupon chained her daughter Andromeda to a rock and left her to be devoured by a sea monster, but she was delivered by Perseus.

CASTA'LIA. One of the fountains in Mount Parnassus, sacred to the Muses.

CASTALI'DES. A name of the Muses, from the fountain Castalia or Castalius.

CAS'TOR. Son of Jupiter and Leda, twin brother of Pollux, noted for his skill in horsemanship. He went with Jason in quest of the Golden Fleece.

CAU'THER. In Mohammedan mythology, the lake of paradise, whose waters are as sweet as honey, as cold as snow, and as clear as crystal; and any believer who tastes thereof is said to thirst no more.

CELE'NO. One of the Harpies, progenitor of Zephyrus, the west wind.

CEN'TAUR. A huntsman who had the fore part like a man, and the remainder of the body like a horse. The Centauri lived in Thessaly.

CEPH'ALUS. Married to Procris, whom he accidentally slew by shooting her, while she was secretly watching him, he thinking she was a wild beast. Cephalus was the type of constancy.

CERAU'NIUS. A Greek name of Jupiter, meaning The Fulminator, from his thunderbolts.

CER'BERUS. Pluto's famous three-headed dog, which guarded the gate of the infernal regions, preventing the living from entering, and the inhabitants from going out.

CE'RES. Daughter of Saturn, the goddess of agriculture, and of the fruits of earth. She taught Triptolemus how to grow corn, and sent him to teach the inhabitants of the earth.

CES'TUS. The girdle of Venus, which excited irresistible affection.

CHA'OS. Allegorically represented the confused mass of matter supposed to have existed before the creation of the world, and out of which the world was formed.

CHAR'ON. The son of Nox and Erebus. He was the ferryman who conveyed the spirits of the dead, in a boat, over the rivers Acheron and Styx to the Elysian Fields. "Charon's toll" was a coin put into the mouth of the dead with which to pay the grim ferryman.

CHARYB'DIS. A dangerous whirlpool on the coast of Sicily. Personified, it was supposed to have been a woman who plundered travelers, but was at last killed by Hercules. Scylla and Charybdis are generally spoken of together to represent alternative dangers.

CHE'MOS. The Moabitish god of war.

CHIMAE'RA. A wild illusion, personified in the monster slain by Bellerophon. It had the head and breast of a lion, the body of a goat, and the tail of a serpent. It used to breathe forth fire.

CHI'RON. The centaur who taught Achilles hunting, music, and the use of medicinal herbs. Jupiter placed him amongst the stars, where he appears as Sagittarius the Archer.

CHLO'RIS. The Greek name of Flora, the goddess of flowers.

CHOU. An Egyptian god corresponding to the Roman Hercules.

CHRO'NOS. Time, the Greek name of Saturn.

CIR'CE. The daughter of the sun. The knowledge of poisonous herbs enabled her to destroy her husband, the king of the Sarmatians, for which act she was banished. When Ulysses landed at Aecea, where she lived, she turned all his followers into swine.

CISSE'TA. The name of one of Actaeon's hounds.

CITHER'IDES. A name of the Muses, from Mount Citheron.

CLI'O. One of the Muses, daughter of Jupiter and Mnemosyne. She presided over history.

CLOACI'NA. The Roman goddess of sewers.

CLO'THO. One of the Fates. She was present at births, and held the distaff from which was spun the thread of life. See ATROPOS and LACHESIS.

CLOWNS OF LY'CIA, THE. Changed into frogs by Latona, because they refused to allow her to drink at one of their streamlets.

CLUACI'NA. A name of Venus, given to her at the time of the reconciliation of the Romans and the Sabines, which was ratified near a statue of the goddess.

CLYTEMNES'TRA. Wife of Agamemnon, slew her husband and married Aegisthus. She attempted to kill her son Orestes, but he was delivered by his sister Electra, who sent him away to Strophius. He afterwards returned and slew both Clytemnestra and Aegisthus.

CLYT'IE. A nymph who was changed into a sunflower because her love of Apollo was unrequited. In the form of this flower she is still supposed to be turning towards Sol, a name of Apollo.

CNEPH. In Egyptian mythology the creator of the universe.

COCY'TUS. The river of lamentation. One of the five rivers of the infernal regions.

COE'CULUS. A violent robber, a son of Vulcan.

COE'LUS. Also called Uranus (or Heaven), the most ancient of the gods.

COLLI'NA. One of the rural deities, the goddess of hills.

CO'MUS. The god of revelry. He presided over entertainments and feasts.

CON'CORD. The symbol of concord was two right hands joined, and a pomegranate.

CONCOR'DIA. The goddess of peace. One of the oldest Roman goddesses. She is represented as holding a horn of plenty in one hand, and in the other a scepter, from which fruit is sprouting forth.

CONSUA'LIA. Games sacred to Neptune.

CON'SUS. A name given to Neptune as being the god of counsel.

COPHET'UA. A legendary king of Africa, who disliked women, but ultimately fell in love with a "beggar-maid," as mentioned in *Romeo and Juliet*.

CO'PIA. The goddess of plenty.

CO'RAN. One of Actaeon's hounds was so named.

CORO'NIS. A consort of Apollo and mother of Aesculapius. Another Coronis was daughter of a king of Phocis, and was changed by Athena into a crow.

CORYBAN'TES. Priests of Cybele. They obtained the name because they were in the habit of striking themselves in their dances.

CORY'DON. A silly love-sick swain mentioned by Vergil.

CORY'THAIX. A name given to Mars, meaning Shaker of the Helmet.

COTYT'TO. The Athenian goddess of immodesty.

CU'PID. The god of love, the son of Jupiter and Venus. He is represented as a naked, winged boy, with a bow and arrows and a torch. When he grew up to be a man he married Psyche.

CUVE'RA. The Indian god of wealth, corresponding to the Greek Plutus.

CYB'ELE. The mother of the gods, and hence called Magna Mater. She was wife of Saturn. She is sometimes referred to under the names of Ceres, Rhea, Ops, and Vesta.

CY'CLOPS or **CY'CLOPES.** The gigantic, one-eyed workmen of Vulcan, who made Jove's thunderbolts.

Hesiod gives their names as Arges, Brontes, and Steropes.

CYG'NUS. The bosom friend of Phaëton. He died of grief on the death of his friend, and was turned into a swan.

CYL'LAROS. One of Castor's horses. The color is mentioned as being coal black, with white legs and tail.

CYL'LO. The name of one of Actaeon's hounds, which was lame.

CYLLOP'OTES. A name given to one of Actaeon's hounds, which limped.

CYN'OSURA. One of the nurses of Jupiter, turned by the god into a conspicuous constellation, Ursa Minor.

CYPARIS'SUS. A boy of whom Apollo was very fond; and when he died he was changed, at Apollo's intercession, into a cypress tree, the branches of which typify mourning.

CY'PRIA. A name of Venus, because she was worshiped in the island of Cyprus.

CYTH'ERA. A name of Venus, from the island to which she was wafted in the shell.

DACTY'LI. Priests of Cybele. They were given the name because, like the fingers, they were 10 in number.

DAED'ALUS. A great architect and sculptor. He invented the wedge, the axe, the level, and the gimlet, and was the first to use sails. Daedalus also constructed the famous labyrinth for Minos, king of Crete.

DA'GON. A god of the Philistines, half man, half fish, like the mermaid. Milton describes him as "Upward man and downward fish."

DA'HAK. The Persian devil.

DAI'TYAS. In Hindu mythology the devils or evil gods.

DAN'AE. A daughter of Acrisius and Eurydice. She had a son by Jupiter, who was drifted out to sea in a boat, but was saved by Polydectes and educated.

DANA'US. King of Argos. The father of 50 daughters, who, all but one, at the command of their father, slew their husbands directly after marriage. For this crime they were condemned to the task of forever trying to draw water with vessels without any bottoms.

DAPH'NE. The goddess of the earth. Apollo courted her, but she fled from him, and was, at her own request, turned into a laurel tree.

DAR'DANUS. A son of Jupiter, who built the city of Dardania and by some writers was accounted the founder of Troy.

DEIANI'RA. Daughter of Oeneus, wife of Hercules. See HERCULES.

DE'LIUS. A name of Apollo from the island in which he was born.

DEL'PHI. A town on Mount Parnassus, famous for its oracle, and for a temple of Apollo.

DEL'PHOS. The place where the temple was built from which the oracle of Apollo was given.

DE'MARUS. The Phoenician name of Jupiter.

DE'MOGOR'GON. The tyrant genius of the soil or earth, the life and support of plants. He was depicted as an old man covered with moss, and was said to live underground. He is sometimes called the king of the elves and fays.

DEUCA'LION. One of the demigods, son of Prometheus and Clymene. He and his wife, Pyrrha, by making a ship, survived the deluge which Jupiter sent on the earth (about 1503 B. C.).

DIAN'A. Goddess of hunting and of chastity. She was the sister of Apollo, and daughter of Jupiter and Latona. She was known among the Greeks as Diana or Phoebe, and was honored as a triform goddess. As a celestial divinity she was called Luna; as a terrestrial, Diana or Dictynna; and in the infernal regions, Hecate.

DICTYN'NA. A Greek name of Diana as a terrestrial goddess.

DI'DO. A daughter of Belus, king of Tyre. It was this princess who bought a piece of land in Africa as large as could be encompassed by a bullock's hide, and, when the purchase was completed, cut the hide into strips, and so secured a large tract of land. Here she built Carthage; and Vergil tells that when Aeneas was shipwrecked on the neighboring coast, she received him with every kindness, and at last fell in love with him. But Aeneas did not reciprocate her affections, and this so grieved her that she stabbed herself.

DI'ES PA'TER. Father of the Day, a name of Jupiter.

DII SELEC'TI. Composed the second class of gods. They were Coelus, Saturn, Genius, Oreus, Sol, Bacchus, Terra, and Luna.

DINDYME'NE. A name of Cybele, from a mountain where she was worshiped.

DIOME'DES. The cruel tyrant of Thrace, who fed his mares on the flesh of his guests, was overcome by Hercules, and was given to the same horses as food.

DIO'NE. A poetic name of Venus.

DIONY'SIA. Festivals in honor of Bacchus.

DIONY'SUS. A name of Bacchus, either from his father Jupiter (Dios), or from his nurses, the nymphs called Nysae.

DIOS'CURI. Castor and Pollux, the sons of Jupiter.

DI'RAE. A name of the Furies.

DIS. A name of Pluto, god of Hades, signifying riches.

DISCOR'DIA. Sister of Nemesis, the Furies, and Death, was driven from heaven for having sown discord among the gods.

DODO'NA. A celebrated oracle of Jupiter.

DODONAE'US. A name of Jupiter, from the city of Dodona.

DOLA'BRA. The knife used by the priests to cut up the sacrifices.

DOOR'GA. A Hindu goddess.

DO'RIS. Daughter of Oceanus, and sister and wife of Nereus. From these two sprang the several tribes of water nymphs.

DO'TO. One of the Nereids or sea nymphs.

DRA'CO. One of Actaeon's hounds.

DRAGON. Seven headed. See GERYON.

DRY'ADS. Rural deities, the nymphs of the forests, to whom their votaries offered oil, milk, and honey.

DWEUR'GAR. Scandinavian god of the Echo—a pigmy.

EB'LIS. The Mohammedan evil genius.

ECHID'NA. A woman having a serpent's tail.

ECHNO'BAS. One of Actaeon's hounds.

ECH'O. A nymph who fell in love with Narcissus. But when he languished and died she pined away from grief and died also, preserving nothing but her voice, which repeats every sound that reaches her.

"Oft by Echo's tedious tales misled."—*Ovid.*

EGE'RIA. A nymph who is said to have suggested to Numa all his wise laws. She became his wife, and at his death was so disconsolate, and shed so many tears, that Diana changed her into a fountain.

E'GIL. The Vulcan of northern mythology.

ELEUSIN'IAN MYSTERIES. Religious rites in honor of Ceres, performed at Eleusis in Attica.

ELYS'IUM or the **ELYSIAN FIELDS.** The temporary abode of the just in the infernal regions.

EMPYRE'AN, THE. The fifth heaven, the seat of the heathen deity.

ENDYM'ION. A shepherd who acquired from Jupiter the faculty of being always young. One of the lovers of Diana.

ENY'O. The Grecian name of Bellona, the goddess of war and cruelty.

E'OS. The Grecian name of Aurora.

E'OUS. One of the four horses which drew the chariot of Sol. The word is Greek, and means red.

EPH'IAL'TES. A giant who lost his right eye in an encounter with Hercules, and the left eye was destroyed by Apollo.

ER'ATO. One of the Muses, the patroness of light poetry. She presided over the triumphs and complaints of lovers, and is generally represented as crowned with roses and myrtle, and holding a lyre in her hand.

ER'EBUS. Son of Chaos, one of the gods of Hades, sometimes alluded to as representing the infernal regions.

EREC'THEUS. Fourth king of Athens, the son of Vulcan.

ERGA'TIS. A name given to Minerva. It means the work-woman, and was given to the goddess because she was credited with having invented spinning and weaving.

ERIN'YS. A Greek name of the Furies. It means Disturber of the Mind.

ERISICH'THON. He was punished with perpetual hunger because he defiled the groves of Ceres and cut down one of the sacred oaks.

ER'OS. The Greek god of love.

EROS'TRATUS. The rascal who burned the temple of Diana at Ephesus, thereby hoping to make his name immortal.

ERYCI'NA. A name of Venus, from Mount Eryx in Sicily.

ERYTHRE'OS. The Grecian name of one of the horses of Sol's chariot.

E'THON. One of the horses which drew the chariot of Sol. The word is Greek and signifies hot.

ET'NA. A volcanic mountain, beneath which, according to Vergil, there is buried the giant Typhon, who breathes forth devouring flames.

EU'DROMOS. The name of one of Actaeon's hounds

EUME'NIDES. A name of the Furies, meaning

mild, and referring to the time when they were approved by Minerva.

EUPHRO'SYNE. One of the three Graces. See GRACES.

EU'RUS. The east wind. A son of Aeolus.

EURY'ALE. One of the Gorgons, daughter of Phorcus and Ceto.

EURYD'ICE. Wife of Orpheus, who was killed by a serpent on her wedding night.

EURYTH'ION. A seven-headed dragon. See GERYON.

EU'TERPE. One of the Muses, the patroness of instrumental music. The word means agreeable.

EU'VYHE. An expression meaning "Well done, son." Jupiter so frequently addressed his son Bacchus by those words that the phrase at last became one of his names.

FAME. A poetical deity, represented as having wings and blowing a trumpet. A temple was dedicated to her by the Romans.

FATES or **PARCAE.** The three daughters of Necessity. Their names were Clotho, who held the distaff; Lachesis, who turned the spindle; and Atropos, who cut the thread with the fatal shears.

FAUNS. Rural divinities, half man and half goat. They were very similar to the Satyrs. The Fauns attended the god Pan, and the Satyrs attended Bacchus.

FAVO'NIUS. The wind favorable to vegetation, that is, Zephyr—the west wind.

FE'BRIS (fever). One of the evil deities, worshiped that she might not do harm.

FEB'RUUS. A name of Pluto, from the part of the funeral rites which consisted of purifications.

FERO'NIA. The Roman goddess of orchards; was patroness of enfranchised slaves. Some authors think Feronia is the same as Juno.

FI'DES. The goddess of faith and honesty, who had a temple in the Capitol of Rome.

FLATH'IN'NIS. In Celtic mythology, Paradise.

FLEECE, GOLDEN. See GOLDEN FLEECE, ARGONAUTS, and JASON.

FLO'RA. Goddess of flowers and gardens; was wife of Zephyrus. She enjoyed perpetual youth. Her Grecian name was Chloris.

FLORA'LIA. Licentious games instituted in honor of the goddess Flora.

FORTU'NA. The goddess of fortune, who had a temple erected to her by Servius Tullius. She was supposed to be able to bestow riches or poverty on mankind, and was esteemed one of the most potent of the ancient goddesses.

FRAUD. One of the evil deities; was represented as a goddess with a human face and a serpent's body, and in the end of her tail was a scorpion's sting. She lived in the river Cocytus, and nothing but her head was ever seen.

FREY. The Scandinavian god of fertility and peace. The patron god of Sweden and Iceland.

FREY'JA. The Scandinavian Venus. The goddess of love.

FRI'GA. The Saxon goddess of earthly enjoyments. The name Friday is derived from her. In Scandinavian mythology she is the goddess of marriage.

FRO. The Scandinavian god of tempests and winds.

FURIES, THE. The three daughters of Acheron and Nox. They were the punishers of evil doers. Their names were Tisiphone, Megaera, and Alecto, and were supposed to personify rage, slaughter, and envy.

GABRIEL. In Jewish mythology, the prince of fire and thunder, and the angel of death to the favored people of God.

GALATAE'A. A sea nymph. Polyphemus, one of the Cyclops, loved her, but she disdained his attentions and became the lover of Acis, a Sicilian shepherd.

GAL'LI. Priests of Cybele who used to cut their arms with knives when they sacrificed, and acted so like madmen that demented people got the name of Gallantes.

GAN'ESA. The Indian Mercury. The god of wisdom and prudence.

GANGA. One of the three Indian river goddesses.

GAN'YMEDE. A beautiful Phrygian youth, son of Tros, king of Troy. He succeeded Hebe in the office of cupbearer to Jupiter. He is generally represented sitting on the back of a flying eagle.

GAUTA'MA. The name of Buddha most used in Burmah.

GENII. Domestic divinities. Every man was supposed to have two of these genii accompanying him; one brought him happiness, the other misery.

GEN'ITOR. A Lycian name of Jupiter.

GE'RYON. A triple-bodied monster who lived at Gades, where his numerous flocks were guarded by Orthos, a two-headed dog, and by Eurythion, a seven-headed dragon. These guardians were destroyed by Hercules, and the cattle taken away.

GLAU'CUS. A fisherman who became a sea god through eating a seaweed, which he thought invigorated the fishes and might strengthen him.

GLAUKO'PIS. A name given to Minerva, because she had blue eyes.

GNOMES. A name given by Plato to the invisible deities who were supposed to inhabit the earth.

GNOS'SIS. A name given to Ariadne, from the city of Gnossus in Crete.

GOLDEN FLEECE, THE. A ram's hide, sometimes described as white, and at other times as purple and golden. It was given to Phryxus, who carried it to Colchis, where King Aetes entertained Phryxus, and the hide was hung up in the grove of Mars. Jason and 49 companions fetched back the golden fleece.

GOPY'A. Indian mythological nymphs.

GOR'GONS, THE. Three sisters, named Stheno, Euryale, and Medusa. They petrified every one they looked at. Instead of hair, their heads were covered with vipers. Perseus conquered them, and cut off the head of Medusa, which was placed on the shield of Minerva, and all who fixed their eyes thereon were turned into stone.

GRACES, THE. The attendants of Venus. Their names were Aglaia, so called from her beauty and goodness; Thalia, from her perpetual freshness; and Euphrosyne, from her cheerfulness. They are generally depicted as three cheerful maidens with hands joined, and either nude or only wearing transparent robes,—the idea being that kindnesses, as personified by the Graces, should be done with sincerity and candor, and without disguise. They were supposed to teach the duties of gratitude and friendship, and they promoted love and harmony among mankind.

GRADIV'US. A name given to Mars by the Romans. It meant the warrior who defended the city against all external enemies.

GRA'GUS. The name by which Jupiter was worshiped in Lycia.

GRAP'SIOS. A Lycian name of Jupiter.

HA'DA. The Babylonian Juno.

HADES. The Greek name of Pluto, the god of the lower world, the word signifying hidden, dark, and gloomy; the infernal regions; sometimes written **ADES.**

HALCY'ONE. One of the Pleiades; was a daughter of Atlas and Pelione.

HAL'CYONS. Sea birds, supposed to be the Greek kingfishers. They made their nests on the waves, and during the period of incubation the sea was always calm. Hence the modern term "Halcyon days."

HAMADRY'ADS. Wood nymphs, who presided over trees, with which they lived and died.

HAROE'RIS. The Egyptian god, whose eyes are the sun and moon.

HAR'PIES. Animals with the heads and breasts of women, the bodies of birds, and the claws of lions. Their names were Aello, Ocypete, and Celeno. They were loathsome creatures, living in filth and poisoning everything with which they came in contact.

HARPI'KRUTI. The Egyptian name of the god Harpocrates.

HARPOC'RATES. Son of Isis; was the god of silence and meditation. He is usually represented as a young man holding a finger of one hand to his lips, while in the other hand he holds a cornucopia.

HA'ZIS. The Syrian war god.

HE'BE. The goddess of youth. She was cupbearer to Jupiter and the gods, until she had an awkward fall at a festival, and so displeased Jupiter that she was deprived of her office, and Ganymede was appointed in her stead.

HEC'ATE. There were two goddesses known by this name, but the one generally referred to in modern literature is Hecate, or Proserpine, the name by which Diana was known in the infernal regions. In heaven her name was Luna, and her terrestrial name was Diana.

HEC'UBA. The mother of Paris; was allotted to Ulysses after the destruction of Troy, and was afterwards changed into a hound.

HELEN. When a child was so beautiful that Theseus and Perithous stole her, but she was restored by Castor and Pollux. She became the wife of Menelaus, king of Sparta, but eloped with Paris, and thus caused the Trojan War. After the death of Paris she married Deiphobus, his brother, and then betrayed him to Menelaus. She was strangled by order of Polyxo, king of Rhodes.

HE'LIADES. The daughters of Sol, and the sisters of Phaeton, at whose death they were so sad that they

stood mourning till they became metamorphosed into poplar trees, and their tears were turned into amber.

HEL'ICON. A mountain in Boeotia sacred to the Muses, from which place the fountain Hippocrene flowed.

HELICO'NIDES. A name of the Muses, from Mount Helicon.

HELIOP'OLIS. In Elysium; was the city of the sun.

HE'LIOS. The Grecian sun god, who went home every evening in a golden boat which had wings.

HEL'LE. Drowned in the sea, into which she fell from off the back of the golden ram, on which she and Phryxus were escaping from the oppression of their stepmother Ino. The episode gave the name of the Hellespont to the part of the sea where Helle was drowned, and it is now called the Dardanelles.

HEMPH'TA. The Egyptian god Jupiter.

HEPHAES'TOS. The Greek Vulcan.

HE'RA. The Greek name of Juno.

HER'CULES. The son of Jupiter and Alcmena. The goddess Juno hated him from his birth, and sent two serpents to kill him, but though only eight months old he strangled the snakes. As he became older he was set by his master Eurystheus what were thought to be 12 impossible tasks, which have long been known as the "Twelve Labors of Hercules." They were:—

First, To slay the Nemean Lion.

Second, To destroy the Hydra which infested the marshes of Lerna.

Third, To bring to Eurystheus the Arcadian Stag with the golden horns and brazen hoofs.

Fourth, To bring to his master the Boar of Erymanthus.

Fifth, To cleanse the stable of King Augeas, in which 3000 oxen had been kept for 30 years, and which had never been cleaned out.

Sixth, To destroy the Stymphalides, terrible carnivorous birds.

Seventh, To capture the Bull that was desolating Crete.

Eighth, To capture the mares of Diomedes, which breathed fire from their nostrils, and ate human flesh.

Ninth, To procure the girdle of Hippolyte, queen of the Amazons.

Tenth, To bring to Eurystheus the flesh-eating oxen of Geryon, the monster king of Gades.

Eleventh, To bring away some of the golden apples from the garden of the Hesperides.

Twelfth, To bring up from Hades the three-headed dog, Cerberus.

All these tasks he successfully accomplished, and, besides, he assisted the gods in their wars with the giants.

HER'MAE. Statues of Hermes (Mercury), which were set up in Athens for boundaries, and as direction marks for travelers.

HERMATHE'NAE. Statues of Mercury and Minerva placed together.

HER'MES. A Greek name of the god Mercury.

HERMI'ONE. Daughter of Mars and Venus, who was turned into a serpent, and allowed to live in the Elysian fields. There was another Hermione, daughter of Menelaus. She was betrothed to Orestes, but was carried away by Pyrrhus, the son of Achilles.

HE'RO. A priestess of Venus, with whom Leander was so enamored that he swam across the Hellespont every night to visit her, but at last was drowned, when Hero threw herself into the sea and was drowned also.

HESPER'IDES. Three daughters of Hesperus, king of Italy. They kept in their garden the golden apples which Juno gave Jupiter on their wedding day.

HES'PERUS. Brother of Atlas; was changed into the evening star.

HES'TIA. The Greek name of Vesta.

HIL'DUR. The Scandanavian Mars.

HIPPOCAM'PUS. The name of Neptune's favorite horse.

HIPPOCRE'NIDES. A name of the Muses, from the fountain of Hippocrene (the horse fountain), which was formed by a kick of the winged horse Pegasus.

HIPPÓLY'TE. Queen of the Amazons, daughter of Mars. Her father gave her a famous girdle, which Hercules was required to procure (see HERCULES). She was conquered by Hercules, and given by him in marriage to Theseus.

HIPPOLY'TUS. Son of Theseus and Hippolyte. He was killed by a fall from a chariot, but was raised to life again by Diana, or, as some say, by Aesculapius.

HIPPO'NA. A rural divinity, the goddess of horses.

HO'RAE. The daughters of Sol and Chronis.

HORAE'A. Certain sacrifices offered to the goddesses of the seasons to invoke fair weather for the ripening of the fruits of the earth.

HORTEN'SIS. A name of Venus, because she looked after plants and flowers in gardens.

HO'RUS. A name of Sol, the Egyptian day god.

HOSTIL'INA. A rural divinity; goddess of growing corn.

HYACIN'THUS. A boy greatly loved by Apollo, but he was accidentally slain by him with a quoit. Apollo caused to spring from his blood the flower Hyacinth.

HY'ADES. Seven daughters of Atlas and Aethra, who form a constellation which, when it rises with the sun, threatens rain.

HY'DRA. A famous monster serpent, which had many heads. It was slain by Hercules.

HYGE'IA. The goddess of health, a daughter of Aesculapius and Epione. She was represented as a young woman feeding a serpent, which is twined round her arm.

HY'LAS. A beautiful boy beloved by Hercules. The nymphs were jealous of him, and spirited him away while he was drawing water for Hercules.

HY'MEN. The Grecian god of marriage, either the son of Bacchus and Venus, or, as some say, of Apollo and one of the Muses. He was represented as a handsome youth, holding in his hand a burning torch.

HYPE'RION. Son of Coelus and Terra. The model of manly beauty, synonymous with Apollo. The personification of the sun.

HYPERMNES'TRA. One of the 50 daughters of Danaus, who were collectively called the Danaides. She was the one who refused to kill her husband on the wedding night.

IAP'ETUS. Son of Coelus and Terra, husband of Clymene. He was looked upon by the Greeks as the father of mankind.

IO'ARUS. Son of Daedalus, who, with his father, made himself wings with which to fly from Crete. They were fixed to the shoulders by wax. Icarus flew too near the sun, and the heat, melting the wax, caused the wings to drop off, and he fell into the sea and was drowned.

ICHNOBA'TES. One of Actaeon's hounds. It means tracker.

IDAE'A. A name of Cybele, from Mount Ida, where she was worshiped.

IDAE'AN MOTHER. Cybele was sometimes so called.

IDA'LIA. A name of Venus, from Mount Idalus.

IMPERA'TOR. A name of Jupiter, given to him at Praeneste.

IN'ACHUS. One of the earliest of the demigods or heroes.

IN'CUBUS. A Roman name of Pan, meaning The Nightmare.

INDIG'ETES. Deified mortals, gods of the fourth order. They were peculiar to some district.

IN'DRA. The Hindu Jupiter. His wife was Indrant, who presides over the winds and thunder.

IN'NUS. A name of Pan, the same as Incubus.

I'NO. Second wife of Athamas, king of Thebes, father of Phryxus and Helle. Ino had two children, who could not ascend the throne while Phryxus and Helle were alive. Ino therefore persecuted them to such a degree that they determined to escape. They did so on a ram, whose hide became the Golden Fleece (see PHRYXUS and HELLE). Ino destroyed herself, and was changed by Neptune into a sea goddess.

INO'A. Festivals in memory of Ino.

I'O. A daughter of Inachus, and a priestess of Juno at Argus. Jupiter courted her, and was detected by Juno, when the god turned Io into a beautiful heifer. Juno demanded the beast of Jupiter, and set the hundred-eyed Argus to watch her. Jupiter persuaded Mercury to destroy Argus, and Io was set at liberty, and restored to human shape. Juno continued her persecutions, and Io had to wander from place to place till she came to Egypt, where she became wife of King Osiris, and won such good opinions from the Egyptians that after her death she was worshiped as the goddess Isis.

IOLA'US. Son of Iphicles; assisted Hercules in conquering the Hydra, by burning with hot irons the place where the heads were cut off; and for his assistance he was restored to youth by Hebe. Lovers used to go to his monument at Phocis and ratify their vows of fidelity.

IO'THUN. Celtic mythological monsters, or giants.

IPH'ICLUS. Twin brother of Hercules, and father of Iolaus.

IPHIGENI'A. A daughter of Agamemnon. He made a vow to Diana which involved the sacrifice of Iphigenia, but just at the critical moment she was spirited away by the goddess, and taken to Tauris, and a beautiful goat was found on the altar in her place.

I'RIS. Daughter of Thaumas and Electra; was the attendant of Juno, and one of the messengers of the gods. Her duty was to cut the thread which detained

expiring souls. She is the personification of the rainbow.

I'SIS. Wife of Osiris.

I'TYS. Killed by his mother Progne when six years old, and given to his father Tereus as food. The gods were so enraged at this that they turned Itys into a pheasant, Progne into a swallow, and Tereus into an owl.

IXI'ON. Son of Phlegyas, king of the Lapithae. For attempting to produce thunder, Jupiter cast him into Hades, and had him bound to a wheel, surrounded with serpents, which is forever turning over a river of fire.

JAN'I. A place in Rome where there were three statues of Janus, and it was a meeting place for usurers and creditors.

JA'NITOR. A title of Janus, from the gates before the doors of private houses being called Januae.

JA'NUS. A king of Italy said to have been the son of Coelus, others say of Apollo. He sheltered Saturn when he was driven from heaven by Jupiter. Janus presided over highways, gates, and locks, and is usually represented with two faces.

JA'SON. Son of Aeson, king of Iolcos. He was brought up by the centaur Chiron. His uncle Aetes sent him to fetch the Golden Fleece from Colchis (see ARGONAUTS). He went in the ship Argo with 49 companions, the flower of Greek youth. With the help of Juno they got safe to Colchis, but the King Aetes promised to restore the Golden Fleece only on condition that the Argonauts performed certain services. Jason was to tame the wild fiery bulls, and to make them plow the field of Mars; to sow in the ground the teeth of a serpent, from which would spring armed men who would fight against him who plowed the field of Mars; to kill the fiery dragon which guarded the tree on which the Golden Fleece was hung. The fate of Jason and the rest of the Argonauts seemed certain; but Medea, the king's daughter, fell in love with Jason, and with the help of charms which she gave him he overcame all the difficulties which the king had put in his way. He took away the Golden Fleece and Medea also. The king sent his son Absyrtus to overtake the fugitives, but Medea killed him, and strewed his limbs in his father's path, so that he might be delayed in collecting them, and this enabled Jason and Medea to escape. After a time Jason got tired of Medea, and married Glauce, which cruelty Medea revenged by killing her children before their father's eyes. Jason was accidentally killed by a beam of the ship Argo falling on him.

JOCAS'TA, otherwise **EPICASTA.** Wife of Laius, king of Thebes, who in after life married her own son, Oedipus, not knowing who he was, and, on discovering the fatal mistake, hanged herself.

JOVE. A very general name of Jupiter.

JUDGES IN HADES, THE. Rhadamanthus for Asiatics; Aeacus for Europeans. Minos was the presiding judge.

JUGATIN'US. One of the nuptial deities.

JU'NO. Daughter of Saturn and Ops, alias Cybele. She was married to Jupiter, and became queen of all the gods and goddesses, and mistress of heaven and earth. Juno was the mother of Mars, Vulcan, Hebe, and Lucina. She prompted the gods to conspire against Jupiter, but the attempt was frustrated, and Apollo and Neptune were banished from heaven by Jupiter. Juno is the goddess of marriage, and the protectress of married women; and she had special regard for virtuous women.

JU'PITER. Son of Saturn and Cybele (or Ops); born on Mount Ida, in Crete, and nourished by the goat Amalthaea. When quite young Jupiter rescued his father from the Titans; and afterwards, with the help of Hercules, defeated the giants, the sons of earth, when they made war against heaven. Jupiter was worshiped with great solemnity under various names by most of the heathen nations. The Africans called him Ammon; the Babylonians, Belus; and the Egyptians, Osiris (see JOVE). He was represented as a majestic personage seated on a throne, holding in his hands a scepter and a thunderbolt; at his feet stood a spread eagle.

KA'LI. A Hindu goddess, after whom Calcutta is named.

KA'LOC. One of the chief of the Mexican gods.

KAM'A. The Hindu god of love.

KEB'LAH. The point of the compass to which worshipers look during their invocations. Thus the Sol or Sun worshipers turn to the east, where the sun rises, and the Mohammedans turn towards Mecca.

KE'DERLI. In Mohammedan mythology, is a god corresponding to the English St. George, and is still invoked by the Turks when they go to war.

KI'UN. The Egyptian Venus.

KNEPH. An Egyptian god, having a ram's head and a man's body.

KRISH'NA. An Indian god, the revenger of wrongs; also called the Indian Apollo.

KRO'DO. The Saxon Saturn.

KU'MA'RA. The war god of the Hindus.

KU'VERA. The Hindu god of riches.

LA'BE. The Arabian Circe, who had unlimited power of metamorphosis.

LACH'ESIS. One of the three Fates or Parcae. She spun the thread of life.

LACTU'RA. One of the goddesses of growing corn.

LA'DON. The dragon which guarded the apples in the garden of the Hesperides. Also the name of one of Actaeon's hounds. Also the river to which Syrinx fled when pursued by Pan, where she was changed into a reed, and where Pan made his first pipe.

LAE'LAPS. One of Diana's hunting dogs, which, while pursuing a wild boar, was petrified. Also the name of one of Actaeon's hounds.

LAKSH'MI. Hindu goddess of wealth and pleasure. One of the wives of Vishnu.

LAM'IA. An evil deity amongst the Greeks and Romans, and the great dread of their children, whom she had the credit of constantly enticing away and destroying.

LAM'PUS. One of Aurora's chariot horses.

LAOC'O-ON. One of the priests of Apollo, who was, with his two sons, crushed to death by serpents, because he opposed the admission of the wooden horse to Troy.

LAOM'EDON. Son of Ilus, a Trojan king. He was famous for having, with the assistance of Apollo and Neptune, built the walls of Troy.

LAP'IS. The oath stone. The Romans used to swear by Jupiter Lapis.

LAP'ITHUS. Son of Apollo. His numerous children were called Lapithae, and they are notorious for their fight with the centaurs at the nuptial feast of Perithous and Hippodamia.

LA'RES AND PENA'TES. Sons of Mercury and Lara, or, as other mythologists say, of Jupiter and Lamida. They belonged to the lower order of Roman gods, and presided over homes and families.

LATO'NA. Daughter of Coeus and Phoebus, mother of Apollo and Diana. Being admired so much by Jupiter, Juno was jealous, and Latona was the object of the goddess's constant persecution.

LAVER'NA. The goddess of thieves.

LE'DA. The mother of Castor and Pollux, their father being Jupiter, in the shape of a swan. After her death she received the name of Nemesis.

LEM'URES. The specters of departed souls. Milton, in his *Ode to the Nativity*, says "Lemures moan with midnight plaint." They are sometimes referred to as the Manes of the dead.

LER'NA. The lake near Argos where Hercules conquered the Hydra.

LE'THE. One of the rivers of the infernal regions, of which the souls of the departed are obliged to drink to produce oblivion or forgetfulness of everything they did or knew while alive on the earth.

LEUCOTH'EA. The name of Ino after she was transformed into a sea nymph.

LEVA'NA. The deity who presided over newborn infants.

LIAK'URA. Mount Parnassus.

LIBITI'NA. The chief of the funeral deities.

LIB'YSSA. Queen of fays and fairies.

LIGE'A. A wood nymph, dryad.

LI'LITH. In Jewish myth, a great enemy to newborn children. She was said to have been Adam's first wife, but, refusing to submit to him, was turned from Paradise and made a specter.

LI'NA. The goddess of the art of weaving.

LIN'DOR. A lover in the shape of a shepherd, like Corydon; a love-sick swain.

LO'FEN. The Scandinavian god who guards friendship.

LOF'UA. The Scandinavian goddess who reconciles lovers.

LO'KI. The Scandinavian Satan, the god of strife, the spirit of evil.

LO'TIS. A daughter of Neptune, who fled from Priapus, and only escaped from him by being transformed into a lotus plant.

LU'CIAN. The impersonation of folly, changed into an ass.

LU'CIFER. The morning star.

LUCI'NA. The goddess who presides at the birth of children. She was a daughter of Jupiter and Juno.

LUD. In ancient British mythology the king of the Britons.

LU'NA. The name of Diana as a celestial divinity. See DIANA and HECATE.

LU'PERCUS or PAN. The Roman god of fertility. His festival day was 15th February, and the festivals were called Lupercalia.

LYCAON'IAN FOOD. Execrable viands, such as were supplied to Jupiter by Lycaon. To test the divine knowledge of the god he served up human flesh, which Jove discovered, and punished Lycaon by turning him into a wolf.

LYCIAN CLOWNS. Turned into frogs by Latona or Ceres.

LYMNI'ADES. Nymphs who resided in marshes.

LYN'CEUS. One of the Argonauts. The personification of sharp-sightedness.

LYRE. This musical instrument is constantly associated with the doings of the ancient deities. Amphion built the walls of Thebes by the music of his lyre.

MAEN'ADES. Priestesses of Bacchus.

MAHA'SOOR. The Hindu god of evil.

MA'IA. The mother of the Grecian Mercury.

MAM'MON. The money god.

MA'NES. The souls of the departed. The god of funerals and tombs.

MA'NU. The Hindu god of law.

MARI'NA. A name of Venus, meaning sea foam, from her having been formed from the froth of the sea.

MARS. The god of war, the son of Jupiter and Juno. Venus was his favorite goddess, and amongst their children were Cupid, Anteros, and Harmonia. In the Trojan War Mars took the part of the Trojans, but was defeated by Diomede.

MAR'SYAS. The name of the piper who challenged Apollo to a musical contest, and, being defeated, was flayed to death by the god. He was the supposed inventor of the flute.

MA'RUT. The Hindu god of tempestuous winds.

MATU'RA. One of the rural deities who protected the growing corn at time of ripening.

MAX'IMUS. One of the appellations of Jupiter, being the greatest of the gods.

MEDE'A. Wife of Jason, chief of the Argonauts.

MEDU'SA. One of the Gorgons. Minerva changed her beautiful hair into serpents. She was conquered by Perseus, who cut off her head, and placed it on Minerva's shield. Every one who looked at the head was turned into stone.

MEGAE'RA. One of the three Furies.

MELLO'NA. One of the rural divinities, the goddess of bees.

MELPOM'ENE. One of the Muses, the goddess of tragedy.

MEN'DES. An Egyptian god like Pan. He was worshiped in the form of a goat.

MENELA'US. A Spartan king. The elopement of his wife Helen with Paris was the origin of the siege of Troy.

MER'CURY. The son of Jupiter and Maia; was the messenger of the gods, and the conductor of the souls of the dead to Hades. He was the supposed inventor of weights and measures, and presided over orators and merchants.

ME'RU. The abode of the Hindu god Vishnu. It is at the top of a mountain 80,000 leagues high. The Olympus of the Indians.

MI'DAS. A king of Phrygia, who begged of Bacchus the special gift that everything he touched might be turned into gold. The request was granted, and as soon as he touched his food it also was turned to gold, and for fear of being starved he was compelled to ask the god to withdraw the power he had bestowed upon him. He was told to bathe in the river Pactolus. He did so, and the sands which he stood on were golden forever after. It was this same king who, being appointed to be judge in a musical contest between Apollo and Pan, gave the Satyr the palm; whereupon Apollo, to show his contempt, bestowed on him a pair of asses' ears. This gave rise to the term "Midas-eared," as a synonym for ill-judged, or indiscriminate.

MI'LO. A celebrated Croton athlete, who is said to have felled an ox with his fist, and to have eaten the beast in one day.

MIMALLO'NES. The "wild women" who accompanied Bacchus, so called because they mimicked his actions.

MI'MIR. In Scandinavian mythology the god of wisdom.

MINER'VA. The goddess of wisdom, war, and the liberal arts; is said to have sprung from the head of Jupiter fully armed for battle. She was a great benefactress of mankind, and patroness of the fine arts. She was the tutelar deity of the city of Athens.

MI'NOS. The principal of the three judges of the lower world, before whom the spirits of the departed appeared and heard their doom.

MIN'OTAUR. The monster, half man, half bull, which Theseus slew.

MITH'RA. A Persian divinity, the ruler of the universe, corresponding with the Roman Sol.

MNEMOS'YNE. Mother of the Muses and goddess of memory. Jupiter courted the goddess in the guise of a shepherd.

MOAK'IBAT. The recording angel of the Mohammedans.

MO'LOCH. A god of the Phoenicians to whom human victims, principally children, were sacrificed. Moloch is figurative of the influence which impels us to sacrifice that which we ought to cherish most dearly.

MO'MUS. The god of sarcasm. The god who blamed Jove for not having made a window in man's breast, so that his thoughts could be seen. His bitter jests occasioned his being driven from heaven in disgrace.

MONE'TA. A name given to Juno by those writers who considered her the goddess of money.

MOON. The moon was, by the ancients, called Hecate before and after setting; Astarte when in crescent form; Diana when in full.

MOR'PHEUS. The god of sleep and dreams, the minister of Somnus.

MORS. Death, a daughter of Nox.

MUN'IN. The Scandinavian god of memory, represented by the raven that was perched on Odin's shoulder.

MUSCA'RIUS. A name given to Jupiter because he kept off the flies from the sacrifices.

MU'SES, THE. Nine daughters of Jupiter and Mnemosyne. They presided over the arts and sciences, music and poetry. Their names were Calliope, Clio, Erato, Thalia, Melpomene, Terpsichore, Euterpe, Polyhymnia, and Urania. They principally resided in Mount Parnassus, at Helicon.

MY'THRAS. The Egyptian name of Apollo.

NAI'ADS, THE. Beautiful nymphs of human form who presided over springs, fountains, and wells. They resided in the meadows by the sides of rivers. Vergil mentions Aegle as being the fairest of them.

NAN'DI. The Hindu goddess of joy.

NARA'KA. The name of the infernal regions amongst the Hindus.

NARA'YANA. The mover of the waters. The Hindu god of tides.

NARCIS'SUS. Son of Cephisus and the Naiad Liriope; a beautiful youth, who was so pleased with the reflection of himself which he saw in the placid water of a fountain that he could not help loving it, imagining that it must be some beautiful nymph. His fruitless endeavors to possess himself of the supposed nymph drove him to despair, and he killed himself. There sprang from his blood a flower, which was named after him, Narcissus.

NAS'TROND. The Scandinavian place of eternal punishment, corresponding with Hades.

NA'TIO. A Roman goddess who took care of young infants.

NEM'ESIS. The goddess of vengeance or justice, one of the infernal deities. Her mother was Nox. She was supposed to be constantly traveling about the earth in search of wickedness, which she punished with the greatest severity.

NEPHA'LIA. Grecian festivals in honor of Mnemosyne, the mother of the Muses.

NEP'TUNE. God of the sea, a son of Saturn and Cybele, and brother of Jupiter and Pluto. He quarreled with Jupiter because he did not consider that the dominion of the sea was equal to Jupiter's empire of heaven and earth; and he was banished from the celestial regions, after having conspired with Pluto to dethrone Jupiter.

NEREIDES, THE. Aquatic nymphs. They were daughters of Nereus and Doris, and 50 in number. They are generally represented as beautiful girls riding on dolphins, and carrying tridents in the right hand.

NERE'US. A sea deity, husband of Doris. He had the gift of prophecy, and foretold fates; but he had also the power of assuming various shapes, which enabled him to escape from the importunities of those who were anxious to consult him.

NES'US. The name of the Centaur which was destroyed by Hercules for insulting Deianira.

NES'TOR. A grandson of Neptune, his father being Neleus, and his mother Chloris. Homer makes him one

of the greatest of the Greek heroes. He was present at the famous battle between the Lapithae and the Centaurs, and took a leading part in the Trojan War. He was the wise counselor of the Greeks.

NID'HOGG. In Scandinavian mythology the dragon which dwells in Nastrond.

NIF'LHEIM. The Scandinavian hell. It was supposed to consist of nine vast regions of ice beneath the North Pole, where darkness reigns eternally. See NASTROND.

NI'OBE. A daughter of Tantalus, and the personification of grief. By her husband Amphion she had seven sons and seven daughters. By the orders of Latona the father and sons were killed by Apollo, and the daughters (except Chloris) by Diana. Niobe, being overwhelmed with grief, escaped further trouble by being turned into a marble statue.

NO'MIUS. A lawgiver; one of the names of Apollo. This title was also given to Mercury for the part he took in inventing beneficent laws.

NORNS. Three Scandinavian goddesses, who wove the woof of human destiny.

NOX. The daughter of Chaos, and sister of Erebus. She personified night, and was the mother of Mors, Nemesis, and the Fates.

NUN'DINA. The goddess who took charge of children when they were nine days old—the day on which the Romans named their children.

NUPTIA'LIS. A title of Juno. When the goddess was invoked under this name, the gall of the victim was taken out and thrown behind the altar, signifying that there should be no gall (bitterness) or anger between married people.

NU'RIEL. In Hebrew mythology the god of hailstorms.

NYCTE'LIUS. A name given to Bacchus, because his festivals were celebrated by torchlight.

NYMPHS. This was a general name for a class of inferior female deities who were attendants of the gods. Some of them presided over springs, fountains, wells, woods, and the sea.

NY'SAE. The names of the nymphs by whom Bacchus was nursed.

NY'SEUS. A name of Bacchus, because he was worshiped at Nysa.

NY'SUS. A king of Megara who was invisible by virtue of a particular lock of hair. This lock his daughter Scylla cut off, and so betrayed her father to his enemies. She was changed into a lark, and the king into a hawk, and he still pursues his daughter, intending to punish her for her treachery.

OAN'NES. An Eastern god, represented as a monster, half man, half fish. He was said to have taught men the use of letters in the daytime, and at night to have retired to the depth of the ocean.

OBAM'BOU. A devil of African mythology.

OCEAN'IDES. Sea nymphs, daughters of Oceanus and Tethys. Their numbers are variously estimated by different poets, some saying there were as many as 3000, while others say there were as few as 16. The principal of them are mentioned under their respective names, as Amphitrite, Doris, Metis, etc.

OCE'ANUS. Son of Coelus and Terra, and husband of Tethys. Several mythological rivers were called his sons, as Alpheus, Peneus, etc., and his daughters were called the Oceanides.

OCRID'ION. A king of Rhodes, who was deified after his death.

OCY'PETE. One of the Harpies, who infected everything she touched. The word means swift of flight.

OCY'ROE. A daughter of Chiron, who had the gift of prophecy. She was metamorphosed into a mare.

O'DIN. In Scandinavian mythology the god of the universe, and reputed father of all the Scandinavian kings. His wife's name was Friga, and his two sons were Thor and Balder.

OED'IPUS. A son of Laius, king of Thebes, best known as the solver of the famous enigma propounded by the Sphinx.

OENO'NE. Wife of Paris, a nymph of Mount Ida, who had the gift of prophecy.

OGYG'IA. An island, the abode of Calypso, in the Mediterranean Sea. It was so beautiful in sylvan scenery that even Mercury (who dwelt on Olympus) was charmed with the spot.

OLE'NUS. A son of Vulcan, husband of Lethaea, a woman who thought herself more beautiful than the goddesses, and as a punishment she and her husband were turned into stone statues.

OLYM'PIUS. A name of Jupiter, from Olympia, where the god had a splendid temple, which was considered to be one of the seven wonders of the world.

OLYM'PUS. The magnificent mountain on the coast of Thessaly, 9000 feet high, where the gods were supposed to reside. There were several other smaller mountains of the same name.

OLY'RAS. A river near Thermopylae, which, it is said, attempted to extinguish the funeral pile on which Hercules was consumed.

OMOPHA'GIA. A Bacchanalian festival at which some uncooked meats were served.

OM'PHALE. The queen of Lydia, to whom Hercules was sold as a bondsman for three years for the murder of Iphitus. Hercules fell in love with her, and led an effeminate life in her society, wearing female apparel, while Omphale wore the lion's skin.

ONA'RUS. A priest of Bacchus.

ONU'VA. The Venus of the ancient Gauls.

OPA'LIA. Roman festivals in honor of Ops, held on 14th of the calends of January.

OPS. Mother of the gods, a daughter of Coelus and Terra. She was known by the several names of Bona Dea, Rhea, Cybele, Magna Mater, Proserpine, Tellus, and Thya; and occasionally she is spoken of as Juno and Minerva. She personified labor, and is represented as a comely matron, distributing gifts with her right hand, and holding in her left hand a loaf of bread. Her festival was the 14th day of the January calends.

ORBO'NA. The goddess of parents bereft of their children.

O'READS. Mountain nymphs, attendants on Diana.

ORGIES. Drunken revels. The riotous feasts of Bacchus were so designated.

ORI'ON. A famous handsome giant, who was blinded by Oenopion for a grievous wrong done to Merope, and he was expelled from Chios. The sound of the Cyclops' hammers led him to the abode of Vulcan, who gave him a guide. He then consulted an oracle, and had his sight restored, as Longfellow says, by fixing

"His blank eyes upon the sun."

He was afterwards slain by Diana and placed amongst the stars, where his constellation is one of the most splendid.

ORITHY'IA. A daughter of Erechtheus, whose lover, Boreas, carried her off while she was wandering by the river Ilissus. Her children were Zetes and Calais, two winged warriors who accompanied the Argonauts.

OR'MUZD. In Persian mythology the creator of all things.

O'ROS. The Egyptian Apollo.

OR'PHEUS. Son of Apollo and the muse Calliope. He was married to Eurydice; but she was stung by a serpent, and died. Orpheus went down to Hades to claim her, and played so sweetly with his lute that Pluto allowed Eurydice to return to the earth with Orpheus, but on condition that he did not look behind him until he had reached the terrestrial regions. Orpheus, however, in his anxiety to see if she were following him, looked round, and Eurydice disappeared from his sight, instantly and forever.

OSI'RIS. The Egyptian god of the sun. He was worshiped under the form of an ox.

OS'SA. The mountain which the giants piled on the top of Pelion to enable them to ascend to heaven and attack the gods.

PACTO'LUS. The river in Lydia where Midas washed himself by order of Bacchus, and the sands were turned to gold.

PAE'AN. A name given to Apollo, from *paean*, the hymn which was sung in his honor after he had killed the serpent Python.

PALAE'MON or **MELICERTA.** A sea god, son of Athamas and Ino.

PA'LES. The goddess of shepherds and protectress of flocks. Her festivals were called Palilia.

PALLA'DIUM. A famous statue of the goddess Pallas (Minerva). She is sitting with a spear in her right hand, and in her left a distaff and spindle. Various accounts are given of the origin of it. Some writers say it fell from the skies. It was supposed that the preservation of the statue would be the preservation of Troy; and during the Trojan War the Greeks were greatly encouraged when they became the possessors of it.

PAL'LAS or **MINERVA.** The name was given to Minerva when she destroyed a famous giant named Pallas.

PAN. The Arcadian god of shepherds, huntsmen, and country folk, and chief of the inferior deities; usually considered to have been the son of Mercury and Penelope.

PANDO'RA. According to Hesiod, the first mortal

female. Vulcan made her of clay, and gave her life. Venus gave her beauty; and the art of captivating was bestowed upon her by the Graces. She was taught singing by Apollo, and Mercury taught her oratory. Jupiter gave her a box, the famous "Pandora's Box," which she was told to give to her husband, Epimetheus, brother of Prometheus. As soon as he opened it there issued from it numberless diseases and evils which were soon spread all over the world, and from that moment they have afflicted the human race. It is said that Hope alone remained in the box.

PAN'THEON. The temple of all the gods, built by Agrippa at Rome, in the reign of Augustus.

PAP'REMIS. The Egyptian Mars.

PAR'CAE, THE. Goddesses who presided over the destiny of human beings. They were also called the Fates, and were three in number, Atropos, Clotho, and Lachesis.

PARIS. Son of Priam, king of Troy, and his mother was Hecuba. It had been predicted that he would be the cause of the destruction of Troy, and his father therefore ordered him to be strangled as soon as he was born; but the slave who had been intrusted with this mission took the child to Mount Ida, and left it there. Some shepherds, however, found the infant and took care of him. He lived among them till he had grown to man's estate, and he then married Oenone, a nymph of Ida. At the famous nuptial feast of Peleus and Thetis, Discordia, who had not been invited, attended secretly; and when all were assembled, she threw amongst the goddesses a golden apple, on which was inscribed, "To the fairest." This occasioned a great contention, for each thought herself the fairest. Ultimately, the contestants were reduced to three, Juno, Pallas (Minerva), and Venus; but Jove himself could not make these three agree, and it was decided that Paris should be the umpire. He was sent for, and each of the goddesses courted his favor by offering all sorts of bribes. Juno offered him power, Pallas wisdom, and Venus promised him the most beautiful woman in the world. Paris gave the golden apple to Venus. Soon after this episode Priam owned Paris as his son, and sent him to Greece to fetch Helen, who was renowned as being the most beautiful woman in the world. She was the wife of Menelaus, king of Sparta; but during his absence Paris carried Helen away to Troy, and this gave rise to the celebrated war between the Greeks and the Trojans, which ended in the destruction of Troy. Paris was among the 676,000 Trojans who fell during or after the siege.

PARNAS'SIDES. A name common to the Muses, from Mount Parnassus.

PARNAS'SUS. The mountain of the Muses in Phocis, and sacred to Apollo and Bacchus. Any one who slept on this mountain became a poet. It was named after one of the sons of Bacchus.

PAR'THENON. The temple of Minerva (or Pallas), at Athens. It was destroyed by the Persians, and rebuilt by Pericles.

PAR'THENOS. A name of Juno, and also of Minerva.

PASIPH'AE. The reputed mother of the Minotaur killed by Theseus. She was said to be the daughter of Sol and Perseis, and her husband was Minos, king of Crete.

PASITH'EA. Sometimes there are *four* Graces spoken of; when this is so, the name of the fourth is Pasithea.

PA'VAN. Hindu god of the winds.

PEG'ASUS. The famous winged horse which was said to have sprung from the blood of Medusa when her head was cut off by Perseus. His abode was on Mount Helicon, where, by striking the ground with his hoof, he caused water to spring forth, which formed the fountain afterwards called Hippocrene.

PE'LEUS. A king of Thessaly, who married Thetis, one of the Nereids.

PE'LIAS. A son of Neptune and Tyro. He usurped the throne of Cretheus, which Jason was persuaded to relinquish to take the command of the Argonautic expedition. On the return of Jason, Medea, the sorceress, undertook to restore Pelias to youth, but required that the body should first be cut up and put in a caldron of boiling water. When this had been done, Medea refused to fulfill her promise.

PE'LIAS. The name of the spear of Achilles, which was so large that none could wield it but the hero himself.

PE'LION. A well-wooded mountain, famous for the wars between the giants and the gods, and as the abode of the Centaurs, who were expelled by the Lapithae.

PE'LOPS. Son of Tantalus, king of Phrygia. His father killed him, and served him up to be eaten at a feast given to the gods, who, when they found out what the father of Pelops had done, restored the son to life, and he afterwards became the husband of Hippodamia.

PENA'TES. Roman domestic gods.

PERSEPH'ONE. The Greek name of Proserpine.

PER'SEUS. A son of Jupiter and Danae, the daughter of Acrisius. His first famous exploit was against the Gorgon, Medusa. He was assisted in this enterprise by Pluto, who lent him a helmet which would make him invisible. Pallas lent him her shield, and Mercury supplied him with wings. He made a speedy conquest of the Gorgon, and cut off Medusa's head, with which he flew through the air, and from the blood sprang the winged horse Pegasus. As he flew along he saw Andromeda chained to the rock, and a sea monster ready to devour her. He killed the monster, and married Andromeda. When he got back, he showed the Gorgon's head to King Polydectes, and the monarch was immediately turned into stone.

PHA'ETON. A son of Sol, or, according to most mythologists, of Phoebus and Clymene. Anxious to display his skill in horsemanship, he was allowed to drive the chariot of the sun for one day. The horses soon found out the incapacity of the charioteer, became unmanageable, and overturned the chariot. There was such great fear of injury to heaven and earth, that Jove, to stop the destruction, killed Phaëton with a thunderbolt.

PHA'ON. A boatman, who received from Venus a box of ointment, with which, when he anointed himself, he grew so beautiful that Sappho became enamored of him; but when the ointment had all been used Phaon returned to his former condition, and Sappho, in despair, drowned herself.

PHILOCTE'TES. Son of Poeas, and one of the companions of Jason on his Argonautic expedition. He was present at the death of Hercules, and received from him the poisoned arrows which had been dipped in the blood of the Hydra. These arrows, an oracle declared, were necessary to be used in the destruction of Troy, and Philoctetes was persuaded by Ulysses to go to assist at the siege. He appears to have used the weapons with great dexterity and with wonderful effect, for Paris was among the heroes whom he killed.

PHILOME'LA. A daughter of Pandion, king of Athens, who was transformed into a nightingale.

PHLEG'ETHON. A river of fire in the infernal regions. It was the picture of desolation, for nothing could grow on its parched and withered banks.

PHLE'GON (earth loving). One of the four chariot horses of Sol.

PHLE'GYAS. Son of Mars and father of Ixion and Coronis. For his impiety in desecrating and plundering the temple of Apollo at Delphi, he was sent to Hades, and there was made to sit with a huge stone suspended over his head, ready to be dropped on him at any moment.

PHOE'BUS. A name of Apollo, signifying light and life.

PHOR'CUS. A son of Neptune, father of the Gorgons.

PHRYXUS. Brother of Helle. He escaped from his step-mother, Ino, on the back of the golden ram, which took him to Colchis. Phryxus sacrificed the ram to Jupiter and gave the golden fleece to Aetes. It was hung in the garden of Ares and guarded by a sleepless dragon.

PICUM'NUS. A rural divinity, who presided over the manuring of lands, called also Sterentius.

PI'CUS. A son of Saturn, father of Faunus; was turned into a woodpecker by Circe, whose love he had not requited.

PIER'IDES. A name of the Muses, derived from Pieria, a fountain near Mount Olympus, where they were supposed to have been born. Also, the daughters of Pierus, a king of Macedonia, who settled in Boeotia. They challenged the Muses to sing, and were changed into magpies.

PILUM'NUS. A rural divinity, who presided over the corn while it was being ground.

PIRITH'OUS. A son of Ixion and great friend of Theseus, king of Athens.

PI'THO. The goddess of persuasion, daughter of Mercury and Venus. She is sometimes referred to under the name of Suada.

PLEI'ADES, THE. Seven daughters of Atlas and Pleione. Their names were Electra, Alcyone, Celaeno, Maia, Sterope, Taygete, and Merope.

PLU'TO. King of the infernal regions. He was a son of Saturn and Ops, and husband of Proserpine, daughter of Ceres. He is sometimes referred to under the name Dis, and he personifies Hades. His principal attendant was the three-headed dog Cerberus, and about his throne were the Eumenides, the Harpies, and the Furies.

PLU'TUS. The god of riches; was son of Jason and Ceres. He is described as being blind and lame; blind because he so often injudiciously bestows his riches, and lame because fortunes come so slowly.

PLU'VIUS. A name of Jupiter, because he had the rain in his control.

PODALIR'IUS. A famous surgeon, a son of Aesculapius, who was very serviceable among the soldiers in the Trojan War.

POL'LEAR. Son of Siva, the Hindu god of wisdom.

POL'LUX. Twin brother of Castor. Their father was Jupiter and their mother Leda. He and his brother form the constellation Gemini. His Greek name was Polydeuces.

POLYBO'TES. One of the giants who made war against Jupiter.

POLYDEC'TES. Turned into stone when Perseus showed him Medusa's head.

POLYHYM'NIA. Daughter of Jupiter and Mnemosyne. One of the Muses, who presided over singing and rhetoric.

POLYPHE'MUS. One of the most celebrated of the Cyclops, a son of Neptune. He captured Ulysses and 12 of his companions, and it is said that six of them were eaten. The rest escaped by the ingenuity of Ulysses, who destroyed the Cyclop's one eye with a firebrand.

POLYX'ENA. Daughter of Priam, king of Troy. It was by her treachery that Achilles was shot in the heel.

POMO'NA. The Roman goddess of fruits and gardens.

PORTU'NUS (PALAEMON). Son of Ino; was god of harbors.

POSEI'DON. A name of Neptune.

PRAC'RITI. The Hindu goddess of nature.

PRI'AM. The last king of Troy.

PRIA'PUS. The guardian of gardens and god of natural reproduction; was son of Venus and Bacchus.

PRIS'CA. Another name of Vesta.

PRO'CRIS. Daughter of the king of Athens.

PROME'THEUS. Son of Iapetus and father of Deucalion. He presumed to make clay men, and animate them with fire which he had stolen from heaven. This so displeased Jupiter that he sent him a box full of evils, which Prometheus refused; but his brother Epimetheus, not so cautious, opened it, and the evils spread over all the earth. Jupiter then punished Prometheus by commanding Mercury to bind him to Mount Caucasus, where a vulture daily preyed upon his liver, which grew in the night as much as it had been reduced in the day, so that the punishment was a prolonged torture. Hercules at last killed the vulture and set Prometheus free.

PROS'ERPINE. A daughter of Jupiter and Ceres. Pluto carried her off to the infernal regions and made her his wife. She was known by the names of "the Queen of Hades," Hecate, Juno Inferna, and Libitina.

PRO'TEUS. A marine deity, who could foretell events and convert himself at will into all sorts of shapes.

PSY'CHE. The wife of Cupid. The name is Greek, signifying the soul or spirit.

PYGMA'LION. A famous sculptor, who had resolved to remain unmarried, but he made such a beautiful statue of a goddess that he begged Venus to give it life. His request being granted, Pygmalion married the animated statue.

PYLO'TIS. A Greek name of Minerva.

PYR'ACMON. One of the chiefs of the Cyclops.

PY'ROIS (luminous). One of the four chariot horses of Sol.

PY'THIA. The priestess of Apollo at Delphi, who delivered the answers of the oracle. Also the name of the games celebrated in honor of Apollo's victory over the Python.

PY'THON. A famous serpent killed by Apollo.

QUAD'RATUS. A surname given to Mercury, because some of his statues were four-sided.

QUAD'RIFRONS. Janus was sometimes depicted with four faces instead of the usual two, and he was then called Janus Quadrifrons.

QUI'ES. The Roman goddess of rest. She had a temple just outside the Collini gate of Rome.

QUIRI'NUS. A name given to Mars during war time; and Vergil refers to Jupiter under the same name.

RA'MA. A Hindu god, who was the terrestrial representative of Vishnu.

REM'BHA. The Hindu goddess of pleasure.

RHADAMAN'THUS. A son of Jupiter and Europa; was the judge of the Asiatics in the infernal regions.

RHAMNU'SIA. A name of Nemesis, from Rhamnus, a town in Attica, where she had a temple in which was her statue, made of one stone 10 cubits high.

RHE'A. The Greek name of Cybele.

RIM'MON. A Phrygian god of whom Milton says—

> ". . . Rimmon, whose delightful seat
> Was fair Damascus, on the fertile banks
> Of Abana and Pharpar, lucid streams."

ROM'ULUS. The traditional founder of Rome. He was a son of Mars and Ilia, and twin brother of Remus. The infants were thrown into the Tiber, but were miraculously saved and suckled by a she-wolf till they were found by Faustulus, a shepherd, who brought them up. Remus was killed in a quarrel with his brother, and Romulus became the famous emperor.

RUMI'A DEA. The Roman goddess of babes in arms.

RUNCI'NA. The goddess of weeding or cleansing the ground.

SA'GA. The Scandinavian goddess of history.

SAL'AMANDERS. The genii who, according to Plato, lived in fire.

SAL'II. The priests of Mars who had charge of the sacred shields.

SALMO'NEUS. A king of Elis who, for trying to imitate Jupiter's splendors, was sent by the god straight to the infernal regions.

SA'LUS. The Roman god of health.

SAPPHO. A celebrated poetess, a native of Lesbos, who flourished B. C. 610. Her only connection with the goddesses of the time is that the Greeks called her "the tenth Muse."

SAT'URN. King of the Universe; was father of Jupiter, Neptune, and Pluto. These gods quarreled among themselves as to the division of their father's kingdom, which ended in Jupiter having heaven and earth, Neptune the sea, and Pluto the infernal regions.

SATURNA'LIA. Festivals held in honor of Saturn about the 16th or 18th of December. Principally famous for the riotous disorder which generally attended them.

SATUR'NIUS. A name given to Jupiter, Neptune, and Pluto, as sons of Saturn.

SATYAVRA'TA. The Hindu god of law. The same as Menu.

SA'TYRS. The attendants of Silenus, who were similar in most respects to the Fauns who attended Pan.

SCYL'LA. A beautiful nymph who excited the jealousy of Neptune's wife, Amphitrite, and was changed by the goddess into a frightful sea monster, which had six fearfully ugly heads and necks, and who, rising unexpectedly from the deep, used to take off as many as six sailors from a vessel, and carry them to the bottom of the sea. An alternative danger with Charybdis.

SCYL'LA. A daughter of Nysus, who was changed into a lark for cutting off a charmed lock of her father's hair.

SEGES'TA. A rural divinity who protected corn during harvest time.

SEM. The Egyptian Hercules.

SEM'ELE. The mother of Bacchus, who was born in a miraculous manner after Jupiter had visited her, at her special request, in all his terrible splendor. She was deified after her death and named Thyone.

SEMI-DEI. The demi-gods.

SEMO'NES. Roman gods of a class between the "immortal" and the "mortal," such as the Satyrs and Fauns.

SEPTE'RION. A festival held in honor of Apollo, at which the victory of that god over the Python was grandly represented.

SERA'PIS. The Egyptian Jupiter, and generally considered to be the same as Osiris.

SERPENT. The Greeks and Romans considered the serpent as symbolical of guardian spirits, and as such it was often engraved on their altars.

SESHA or **ANANTA.** The Egyptian Pluto.

SILE'NUS. A Bacchanalian demi-god, the chief of the Satyrs. He is generally represented as a fat, drunken old man, riding on an ass, and crowned with flowers.

SI'RENS, THE. Sea nymphs, who by their music allured mariners to destruction. To avoid the snare when nearing their abode, Ulysses had the ears of his companions stopped with wax, and had himself tied to the mast of his ship. They thus sailed past in safety; but the Sirens, thinking that their charms had lost their powers, drowned themselves.

SIS'YPHUS. Son of Aeolus and Enaretta. He was condemned to roll a stone to the top of a hill in the infernal regions, and, as it rolled down again when he reached the summit, his punishment was perpetual.

SI'VA. In Hindu mythology the "changer of form."

SLEIP'NER. The eight-legged horse of Odin, the chief of the Scandinavian gods.

SOL. The sun. The worship of the god Sol is the

oldest on record, and though he is sometimes referred to as being the same as the god Apollo, there is no doubt he was worshiped by the Egyptians, Persians, and other nations long before the Apollo of the Greeks was heard of.

SOM'NUS. The god of sleep, son of Nox (Night). He was one of the infernal deities, and resided in a gloomy cave, void of light and air.

SOS'PITA. A name of Juno, as the safeguard of women.

SO'TER. A Greek name of Jupiter, meaning deliverer.

SPHINX, THE. A monster having the head and breasts of a woman, the body of a dog, the tail of a serpent, the wings of a bird, the paws of a lion, and a human voice. She lived in the country near Thebes, and proposed to every passer-by the following enigma: "What animal is that which walks on four legs in the morning, two at noon, and three in the evening?" Oedipus solved the riddle thus: "Man is the animal; for when an infant he crawls on his hands and feet, in the noontide of life he walks erect, and as the evening of his existence sets in he supports himself with a stick." When the sphinx found her riddle solved she destroyed herself.

STEREN'TIUS. The Roman god who invented the art of manuring lands. See PICUMNUS.

STER'OPES. One of the Cyclops.

STYMPHALI'DES. The carnivorous birds destroyed in the sixth labor of Hercules.

STYX. A noted river of Hades, which was held in such high esteem by the gods that they always swore, "By the Styx," and such an oath was never violated.

SUA'DA. The goddess of persuasion.

SURADE'VI. The Hindu goddess of wine.

SURY'A. The Hindu god corresponding to the Roman Sol, the sun.

SYLPHS. Genii who, according to Plato, lived in the air.

SYLVES'TER. The name of Mars when he was invoked to protect cultivated land from the ravages of war.

SYR'INX. The name of the nymph who, to escape from the importunities of Pan, was by Diana changed into reeds, out of which he made his celebrated pipes, and named them "The Syrinx."

TAC'ITA. The goddess of silence.

TAN'TALUS. Father of Niobe and Pelops, who, as a punishment for serving up his son Pelops as meat at a feast given to the gods, was placed in a pool of water in the infernal regions; but the waters receded from him whenever he attempted to quench his burning thirst. Hence the word tantalizing.

TAR'TARUS. An inner region of hell, to which the gods sent the exceptionally depraved.

TELCHI'NES. Priests of Cybele, who were famous magicians.

TEL'LUS. A name of Cybele, wife of Saturn.

TEMPLE. An edifice erected to the honor of a god or goddess, in which the sacrifices were offered.

TENTH MUSE. Sappho was so called.

TER'EUS. A son of Mars. He married Progne, daughter of the king of Athens, but became enamored of her sister Philomela, who, however, resented his attentions, which so enraged him that he cut out her tongue. When Progne heard of her husband's unfaithfulness she took a terrible revenge (see ITYS). Progne was turned into a swallow, Philomela into a nightingale, Itys into a pheasant, and Tereus into a hoopoo, a kind of vulture,—some say an owl.

TERGEMI'NA. A name of Diana, alluding to her triform divinity as a goddess of heaven, earth, and hell.

TER'MINUS. The Roman god of boundaries.

TERPSICH'ORE. One of the nine Muses. She presided over dancing.

TER'RA. The earth; one of the most ancient of the Grecian goddesses.

THALES'TRIS. A queen of the Amazons.

THALI'A. One of the nine Muses. She presided over festivals and comedy.

THALI'A. One of the Graces.

THAM'YRIS. A skillful singer, who presumed to challenge the Muses to sing, upon condition that if he did not sing best they might inflict any penalty they pleased. He was, of course, defeated, and the Muses made him blind.

THI'A. A daughter of Coelus and Terra; wife of Hyperion.

THE'MIS. A daughter of Coelus and Terra, and wife of Jupiter; was the Roman goddess of laws, ceremonies, and oracles.

THE'SEUS. One of the most famous of the Greek heroes. He was a son of Aegeus, king of Athens.

THE'TIS. A sea goddess, daughter of Nereus and Doris. Her husband was Peleus, king of Thessaly, and she was the mother of the famous Achilles, whom she rendered all but invulnerable by dipping him into the river Styx. See ACHILLES.

THOR. The Scandinavian war god (son of Odin), who had rule over the Aerial regions, and, like Jupiter, hurled thunder against his foes.

THOR'S BELT. A girdle which doubles his strength whenever the war god puts it on.

THOTH. The Mercury of the Egyptians.

THYA'DES. Priestesses of Bacchus, who ran wild in the hills, wearing tiger skins and carrying torches.

THYR'SUS. The staff of Bacchus.

TIME or SATURN. The husband of Virtue and father of Truth.

TISIPH'ONE. One of the Furies.

TI'TAN. Elder brother of Saturn, who made war against him, and was ultimately vanquished by Jupiter.

TI'TANS. The supporters of Titan in his war against Saturn and Jupiter.

TITHO'NUS. The husband of Aurora. At the request of his wife the gods granted him immortality, but she forgot at the same time to ask that he should be granted perpetual youth. The consequence was that Tithonus grew old and decrepit, while Aurora remained as fresh as the morning. The gods, however, changed him into a grasshopper, which is supposed to moult as it gets old, and grows young again.

TIT'YUS. A son of Jupiter. A giant who was thrown into the innermost hell for insulting Diana. He, like Prometheus, has a vulture constantly feeding on his ever-growing liver.

TRIPTOL'EMUS. A son of Oceanus and Terra. He was a great favorite of the goddess Ceres, who cured him of a dangerous illness when he was young, and afterwards taught him agriculture.

TRITERI'CA. Bacchanalian festivals.

TRI'TONS. Sons of Triton, a son of Neptune and Amphitrite. They were the trumpeters of the sea gods, and were depicted as a sort of mermen—the upper half of the body being like a man, and the lower half like a dolphin.

TROPHO'NIUS. One of Jupiter's most famous oracles.

TROY. The classic poets say that the walls of this famous city were built by the magic sound of Apollo's lyre.

TRUTH. A daughter of Time, because Truth is discovered in the course of Time. Democritus says that Truth lies hidden at the bottom of a well.

TUTEL'INA. A rural divinity—the goddess of granaries.

TY'PHON. A monster with a hundred heads who made war against the gods, but was crushed by Jove's thunderbolts, and imprisoned under Mount Etna.

TY'PHON. In Egyptian mythology the god who tried to undo all the good work effected by Osiris.

UL'LER. The Scandinavian god who presided over archery and duels.

ULYS'SES. A noted king of Ithaca, whose exploits in connection with the Trojan War, and his adventures on his return therefrom, are the subject of Homer's *Odyssey*. His wife's name was Penelope, and he was so much endeared to her that he feigned madness to get himself excused from going to the Trojan War; but his artifice was discovered, and he was compelled to go. He was of great help to the Grecians, and forced Achilles from his retreat and obtained the charmed arrows of Hercules from Philoctetes, and used them against the Trojans. He enabled Paris to shoot one of them at the heel of Achilles, and so kill that charmed warrior. During his wanderings on his homeward voyage he was taken prisoner by the Cyclops, and escaped, after blinding Polyphemus, their chief. At Aeolia he obtained all the winds of heaven, and put them in bags; but his companions, thinking that the bags contained treasure which they could rob him of when they got to Ithaca, cut them and let out the winds, and the ships were immediately blown back to Aeolia. After Circe had turned his companions into swine on an island where he and they were shipwrecked, he compelled the goddess to restore them to their human shape. As he passed the islands of the Sirens he escaped their allurements by stopping the ears of his companions with wax, and fastening himself to the mast of his ship. His wife Penelope was a pattern of constancy; for, though Ulysses was reported to be dead, she would not marry any one else, and had the satisfaction of having her husband return after an absence of about 20 years.

UN'DINE. A water nymph, or sylph.

UNX'IA. A name of Juno, relating to her protection of newly-married people.

URA'NIA. A daughter of Jupiter and Mnemosyne —one of the Muses, who presided over astronomy.
URA'NUS. The Greek name of Coelus. His descendants are sometimes called Uranids.
UR'GUS. A name of Pluto, signifying the Impeller.
UT'GORD LO'KI. In Scandinavian mythology the king of the giants.

VALHAL'LA. The Scandinavian temple of immortality, inhabited by the souls of heroes slain in battle.
VA'LI. The Scandinavian god of archery.
VALLO'NIA. The goddess of valleys.
VARU'NA. The Hindu Neptune—generally represented as a white man riding on a sea horse, carrying a club in one hand and a rope in the other.
VEJO'VIS. A god of the under world whose power to injure corresponded to that of Jupiter to help; sometimes identified with Apollo.
VE'NUS. The goddess of beauty, and mother of love. She is said to have sprung from the foam of the sea, and was immediately carried to the abode of the gods on Olympus, where they were all charmed with her extreme beauty. Vulcan married her, but she permitted the attention of others of the gods, and notably of Mars, their offspring being Hermione, Cupid, and Anteros. After this she left Olympus and fell in love with Adonis, a beautiful youth, who was killed when hunting a wild boar. Venus indirectly caused the Trojan War, for, when the goddess of discord had thrown among the goddesses the golden apple inscribed "To the fairest," Paris adjudged the apple to Venus, and she inspired him with love for Helen, wife of Menelaus, king of Sparta. Paris carried off Helen to Troy, and the Greeks pursued and besieged the city (see HELEN, PARIS, and TROY). Venus is mentioned by the classic poets under the names of Aphrodite, Cypria, Urania, Astarte, Paphia, Cythera, and the laughter-loving goddess. Her favorite residence was at Cyprus. Incense alone was usually offered on her altars, but if there was a victim it was a white goat. Her attendants were Cupids and the Graces.
VERTICOR'DIA. A Roman name of Venus, signifying the power of love to change the hard hearted. The corresponding Greek name was Epistrophia.
VERTUM'NUS. God of spring, or, as some mythologists say, of the seasons; the husband of Pomona, the goddess of orchards.
VES'TA. Daughter of Saturn and Cybele; was the goddess of fire. She had under her special care and protection a famous statue of Minerva, before which the Vestal Virgins kept a fire or lamp constantly burning.

VES'TAL VIR'GINS. The priestesses of Vesta, whose chief duty was to see that the sacred fire in the temple of Vesta was not extinguished. They were always selected from the best families, and were under a solemn vow of chastity, and compelled to live perfectly pure lives.
VIA'LIS. A name of Mercury, because he presided over the making of roads.
VIC'TORY. A goddess, the daughter of Styx and Acheron, generally represented as flying in the air holding out a wreath of laurel.
VI'DAR. A Scandinavian god, who could walk on the water and in the air. The god of silence (corresponding with the classic Harpocrates).
VIR'TUE. A goddess worshiped by most of the ancients under various names. The way to the temple of honor was through the temple of virtue.
VISH'NU. The Preserver; a principal Hindu god.
VUL'CAN. The god of fire; was the son of Jupiter and Juno. He offended Jupiter, and was by him thrown out of heaven. He was nine days falling, and at last dropped into Lemnos with such violence that he broke his leg, and was lame forever after. Vulcan was married to Venus. He is supposed to have formed Pandora out of clay. His servants were the Cyclops. He was the patron deity of blacksmiths.
VULCANA'LIA. Roman festivals in honor of Vulcan, at which the victims were thrown into the fire and burned to death.

WO'DEN. The Anglo-Saxon form of the Scandinavian god Odin; Wednesday is called after him.

XAN'THUS. The name of the wonderful horse of Achilles.

YA'MA. The Hindu devil, generally represented as a terrible monster of a green color, with flaming eyes.
YGDRA'SIL. The famous ash tree of Scandinavian mythology, under which the gods held daily council.
Y'MIR. The Scandinavian god corresponding to Chaos of the classics.

ZEPH'YR. The god of flowers, a son of Aeolus and Aurora; the west wind.
ZE'TES. With his brother Calais, drove the Harpies from Thrace.
ZE'THUS. Twin brother of Amphion.
ZEUS. The Greek name of Jupiter.

Distinctive Names of Gods and Goddesses.

Apollo, Canoba, Cynthius, Delius, Delphicus, Demarus, Horus, Khrishna, Mythras, Numius, Oros, Paean, Phoebus, Pythius, Sol.
Aurora, Eos.
Bacchus, Biformis, Brisaeus, Dionysus, Nyctelius, Nyseus.
Buddha, Gautama.
Ceres, Cybele, Hestia, Ops, Prisca, Rhea, Vesta.
Cupid, Eros, Kama.
Diana, Artemis, Dyctinna, Hecate, Luna, Phoebe, Proserpine, Tergemina.
Flora, Chloris.
Hercules, Alcides, Sem.
Juno, Hada, Hera, Moneta, Nuptialis, Parthenos, Sospita.
Jupiter, Ammon, Apis, Assabinus, Belus, Capitolinus, Ceraunius, Demarus, Dies Pater, Dodonaeus, Genitor, Gragus, Grapsios, Hemphta, Imperator, Indra, Jove, Maximus, Muscarius, Olympius, Osiris, Pluvius, Saturnius, Soter, Zeus.
Mars, Corythaix, Gradivus, Quirinus, Papremis, Sylvester.
Mercury, Camillus, Caresa, Hermes, Quadratus, Thoth, Vialis.
Minerva, Athena, Ergotis, Glaukopis, Pallas, Pylotis.
Neptune, Consus, Poseidon, Varuna.
Pan, Incubus, Innus, Mendes, Supersus.
Pluto, Dis, Februus, Hades, Shesa, Urgus.
Saturn, Chronos, Krodo.
Venus, Acidalia, Aphrodite, Armata, Astarte, Clucina, Cypria, Cythera, Dione, Erycina, Hortensis, Idalia, Onuva.
Vulcan, Hephaestos.

DICTIONARY OF PSEUDONYMS.

Comprising pen names of noted writers, and epithets applied to famous personages.

Abimelech Coody,	Gulian C. Verplanck.
Abraham, Brother,	Rev. Richard King.
Academicus,	Rev. Aulay Macaulay.
Achitophel, "Achitophel and Absalom,"	Earl of Shaftesbury (1621-1638).
Ackermann, Gottlieb,	Franz Xavier Mayer.
Acworth, John,	Rev. F. R. Smith.
Adams, Moses,	Geo. Wm. Bagley.
Adams, Stephen,	Michael Maybrick.
Addison of the North, "The Man of Feeling,"	Henry Mackenzie.
Adeler, Max, "Out of the Hurly Burly,"	Charles Heber Clark.
Admirable Doctor,	Roger Bacon.
Adonais, "Adonais,"	Keats (name given by Shelley).
Agate,	Whitelaw Reid.
Agläus,	Henry Timrod.
Akers, Elizabeth,	Mrs. E. M. Allen.
A. K. H. B.,	Rev. A. K. H. Boyd.
Alcaeus,	James Montgomery.
Alcibiades, *Punch*, 1846,	Lord Tennyson.
Alexander, Mrs.,	Mrs. A. F. Hector.
Alexander, Sir Drawcansir,	Tobias George Smollett.
Alexander the Coppersmith, LL.D.,	Thomas Erskine, Baron Erskine.
Alexander the Corrector,	Alexander Cruden.
Alexander of the North, The,	Charles XII. of Sweden.
Allen, F. M.,	Edmund Downey.
A. L. O. E. (i. e., A Lady of England),	Charlotte Maria Tucker.
Alte Fritz, Der,	Frederick the Great.
Amateur Casual,	James Greenwood.
Anacreon Moore,	Thomas Moore.
Anacreon of Painters,	Francesco Albani.
Anacreon of Persia,	Hafiz.
Anacreon of the Guillotine,	Bertrand Barrere.
Ane of that Ilk,	Prof. W. E. Aytoun.
Angler, An, "Salmonia,"	Sir Humphry Davy.
Anstey, F.,	Thomas Anstey Guthrie.
Apostate, Julian The	Roman Emperor Julian.
Apostle of Germany,	St. Boniface.
Apostle of Ireland,	St. Patrick.
Apostle of Temperance,	Rev. Theobald Mathew.
Apostle of the English,	St. Augustine.
Apostle of the French,	St. Denis.
Apostle of the Frisians,	St. Wilbrord or Willibrod.
Apostle of the Gauls,	St. Irenaeus.
Apostle of the Goths,	Ulfilas.
Apostle of the Indians,	Rev. John Eliot.
Apostle of the North,	Anscharius or Ansgar.
Apostle of the North,	Bernard Gilpin.
Apostle to the Indies,	St. Francis Xavier.
Astrophel,	Sir Philip Sidney.
Attic Bee,	Sophocles.
Attic Muse,	Xenophon.
Atticus,	Joseph Addison (name given by Pope in "Prologue to the Satires").
Austrian Hyena,	Baron Julius Jakob von Haynau.
Autocrat, The,	Dr. Oliver Wendell Holmes.
Bab, "Bab Ballads,"	W. S. Gilbert.
Baba, Ali,	Alberigh Mackay.
Badinguet,	Napoleon III.
Balfour, Clara,	Mrs. Felicia Dorothea (Browne) Hemans.
Bard, The,	Edw. Jerningham.
Bard of Avon,	Shakespeare.
Bard of Ayrshire,	Robert Burns.
Bard of Rydal Mount, The,	Wm. Wordsworth.
Bayard, The Polish,	Prince Joseph Poniatowski.
Beau Brummel,	George Bryan Brummel.
Beauclerc,	Henry I. of England.
Beau Nash,	Richard Nash (also called "King of Bath").
Bede, Cuthbert,	Rev. Edward Bradley.
Bell, Acton,	Anne Bronte.
Bell, Currer,	Charlotte Bronte.
Bell, Ellis,	Emily J. Bronte.
Bell, Lilian,	Mrs. Arthur Hoyt Bogue.
Bell-the-Cat,	Archibald Douglas, Fifth Earl of Angus.
Belted Will,	Lord William Howard.
Benson, Carl,	Charles Astor Bristed.
Berwick, Mary,	Adelaide Anne Procter.
Bess, Good Queen,	Queen Elizabeth of England.
Bettina,	Elisabeth (Brentano) von Arnim.
Bibliophile,	L. A. Allibone.
Bibliophile, Jacob,	Paul Lacroix.
Bickerstaff, Isaac,	Sir Richard Steele.
Biglow, Hosea,	James Russell Lowell.
Billings, Josh,	H. W. Shaw.
Black Douglas,	(Generic name of Scotch family of Douglas.)
Black Prince, The,	Edward, Prince of Wales, son of Edward III. of England.
Blacksmith, The Learned, "Sparks from the Anvil,"	Elihu Burritt.
Blind Harry,	Henry the Minstrel.
Bluff Hal, or Harry,	King Henry VIII. of England.
Boisgilbert, Edmund,	Ignatius Donnelly.
Boldrewood, Rolf,	Thomas A. Browne.
Bon Gaultier,	Prof. W. E. Aytoun and Sir Theo. Martin.
Bouverie, Bartholomew,	Rt. Hon. W. E. Gladstone, M.P.
Boz,	Charles Dickens.
Bozzy,	James Boswell.
Braddon, Miss M. E.,	Mrs. John Maxwell.
Breitmann, Hans,	Charles Godfrey Leland.
Brown, Tom,	Thomas Hughes, Q.C., M.P.
Brown, Tom, the Younger,	Thomas Moore.
Burlington Hawkeye Man,	Robert Jones Burdette.
Byron, the Russian,	Alexander Sergeivitch Puschkin.
Cadenus,	Jonathan Swift.
Caliban,	Robert Buchanan.
Caliban,	Louis Jean Emmanuel Gonzalès.
Candidus,	Samuel Adams.
Carmen Sylva,	Elizabeth, Queen of Roumania.
Carroll, Lewis,	Rev. C. Lutwidge Dodgson.
Caskoden, Edward,	Charles Major.
Catholicus,	Cardinal John Henry Newman.
Cato,	Alexander Hamilton.
Chicot,	Epes Winthrop Sargent.
Chinese Gordon,	Maj. Gen. Charles George Gordon.
Citizen King,	Louis Philippe.
Cleisthbotham, Jedediah,	Sir Walter Scott.
Colman, R. W.,	James Hogg, the Ettrick Shepherd.
Common Sense,	Thomas Paine.
Condroux, Alfred,	Honoré de Balzac.
Confessor, The,	Edward III., King of Anglo-Saxons.
Connor, Ralph,	Rev. C. W. Gordon.
Conqueror, William the,	Duke of Normandy.
Conway, Hugh,	F. J. Fargus.
Coolidge, Susan,	Sarah C. Woolsey.
Cornwall, Barry,	Bryan Waller Procter.
Corrector, Alexander the,	Alexander Cruden.
Cotonnet,	Alfred de Musset.
Craddock, Charles E.,	Mary N. Murfree.
Crayon, Geoffrey,	Washington Irving.
Creyton,	J. T. Trowbridge.
Crichton, The Admirable,	James Crichton.
Croaker & Co.,	Joseph Rodman Drake, Fitz Greene Halleck.
Crowfield, Christopher,	Mrs. H. Beecher Stowe.
Cruiser, Benedict	G. A. Sala.
Curate of Meudon (le Cure de Meudon),	Rabelais.
Curtius,	Noah Webster.
Damsel of Brittany,	Eleanora, granddaughter of Henry II. of England.
Danbury Newsman,	J. M. Bailey.
Davy,	Alexandre Dumas.
Dean, The,	Jonathan Swift.
Defender of the Truth,	Henry VIII. of England
Delorme, Joseph,	Chas. Augustin Sainte Beuve.

Democratic Tory, A,	"Benj. Disraeli: the Past and the Future," John Skelton.
Democritus, Junior,	"Anatomy of Melancholy," Robert Burton.
Dix, Dorothy,	Elizabeth M. Gilmer.
Doctor Angelicus,	Thomas Aquinas.
Doctor Authenticus,	Gregory of Rimini.
Doctor, The,	Robert Southey.
Doe, John,	Geo. Cavendish Bentinck.
Drapier, M. B.,	Jonathan Swift.
Duchess, The,	Mrs. Hungerford.
Dunshunner, Augustus,	Prof. Wm. Edmondstoune Aytoun.
Editor, The,	Ambrose Eccles.
Elia,	Charles Lamb.
Eliot, George,	Mrs. J. W. Cross, *née* Marian Evans.
Elmwood,	James Russell Lowell.
English Officer, An,	Lieut. Col. Alexander Jardine.
Enemy to Peace, An,	Jonathan Swift.
English Opium Eater,	Thomas De Quincey.
English Rabelais, The,	Dean Swift.
English Republican, An,	Algernon Chas. Swinburne.
English Roscius, The,	David Garrick.
English Tory,	Sir Richard Steele.
Englishman, An,	Thomas Paine.
Ettrick Shepherd,	James Hogg.
Expounder of the Constitution,	Daniel Webster.
Fancy, One of the,	Thomas Moore.
Fat Contributor, The,	W. M. Thackeray.
Father of Angling,	Izaak Walton.
Father of English Poetry,	Title given by Dryden to Chaucer.
Father of Epic Poetry,	Homer.
Father of His Country,	Given by Roman Senate to Cicero.
Father of His Country,	George Washington.
Father of His People,	Louis XII. of France.
Father of History,	Herodotus.
Father of Jests,	Joseph Miller.
Father of Letters,	Francis I., King of France.
Father of Letters,	Lorenzo de' Medici, Ruler of Florence.
Father of Medicine,	Hippocrates.
Father of Music,	Giovanni, Pierluigi da Palestrina.
Father of Tragedy,	Title bestowed by Athenians upon Aeschylus.
Federalist, A,	Noah Webster.
Fellow of the Royal Society, A,	Cotton Mather.
Female Howard,	Mrs. Elizabeth Fry.
Fern, Fanny,	Mrs. James Parton.
Fitz-Boodle, George,	W. M. Thackeray.
Fitznoodle,	B. B. Vallentine.
Fitzvictor, John,	Percy Bysshe Shelley.
Forrester, Frank,	Henry Wm. Herbert.
Foucher, Paul,	Victor Hugo.
Fra Diavolo,	Michele Pezza.
Fra Elbertus,	Elbert Hubbard.
France, Anatole,	Jacques Anatole Thibault.
Freeman, A,	Jean Joseph Louis Blanc.
Freeman, Mrs.,	First Duchess of Marlborough.
Froissart, Jean,	Alphonse Daudet.
Gaston, Marie,	Alphonse Daudet.
Gay, Mr. Joseph,	Alexander Pope.
Gazul, Clara,	Prosper Merimee.
Gentleman, A,	Edmond Hoyle.
German Milton, The,	Friedrich Gottlieb Klopstock.
German Plato, The,	Friedrich Heinrich Jacobi.
German Voltaire, The,	Christoph Martin Wieland.
Gladiolus,	Wm. Ewart Gladstone.
Good Gray Poet,	Walt Whitman.
Good Knight, without Fear and without Reproach, The,	Pierre de Terrail Bayard.
Goodwell, Godek,	Horace Greeley.
Gorky, Maxim,	A. M. Peshkov.
Goslett, Paul,	Chas. Lever.
Gower, The Moral,	John Gower.
Graduate of Oxford,	John Ruskin.
Grand, Sarah,	Miss Clarke; Mrs. Haldane McFall.
Gray, Maxwell,	Miss Tuttiett.
Great Commoner,	William Pitt.
Great Elector,	Frederick William, Elector of Brandenburg.
Gushington, Angelina,	Lady Dufferin.
Gyp, Gabrielle Sybille,	Comtesse de Martel.

"H. H.,"	Helen Hunt Jackson.
Hamilton, Gail,	Mary Abigail Dodge.
Harland, Marion,	Mrs. Mary V. Terhune.
Harlequin,	Robert Harley.
Helvidius,	James Madison.
Hero of the Nile,	Horatio Nelson.
Heron, E. and H.,	Mrs. Kenneth and Mr. Hesketh Prichard.
Harte, Bret,	Francis Bret Harte.
Hibernia,	Jonathan Swift.
Hierro,	Victor Marie Hugo.
Historicus,	George Grote.
Hobbes, John Oliver,	Miss Richards; Mrs. Craigie.
Hoffmann, Prof. Louis,	Angelo John Lewis.
Holm, Saxe,	Helen Hunt Jackson.
Honeycombe, Henry,	Leigh Hunt.
Hope, Anthony,	Anthony Hope Hawkins.
Hope, F. T. L.,	Dr. Farrar.
Huntington, Faye,	Theodosia T. Foster.
Ignatius, Father,	J. L. Lyne.
Inchiquin,	Robert Southey.
Incorruptible, The,	Robespierre.
Ingham, Col. Frederick,	Edward Everett Hale.
Ingoldsby, Thomas,	Rev. R. H. Barham.
Irish Gentleman, An,	Thomas Moore.
Iron Duke,	Duke of Wellington.
Iron Hand, The,	Gottfried von Berlichingen.
Iron, Ralph,	Miss Olive Schreiner; Mrs. Cronwright.
Ironside,	Edmund II. (989-1016).
Ironside, Nestor,	Sir Richard Steele.
Irrefragable Doctor,	Alexander of Hales.
Isa,	Mrs. Isa Craig-Knox.
J. S. of Dale,	Frederick J. Stimson.
Jacob Omnium's Hoss,	W. M. Thackeray.
James, S. T.,	Horace E. Scudder.
Jeames,	W. M. Thackeray.
Jean Jacques,	Jean Jacques Rousseau.
Jessamine, James,	Bryan Waller Procter.
Jessamy Bride,	Mary Horneck; Mrs. Gwyn.
Jewish Plato, The,	Philo Judaeus.
Jobber, A,	Daniel Defoe.
Josiah Allen's Wife,	Marietta Holley.
Kata Phusin,	John Ruskin.
Kerr, Sherrill,	Julia Magruder.
King Maker, The,	Richard Nevil.
King of Courts,	Quintus Hortensius.
Kit,	Prof. John Wilson.
Knickerbocker, Diedrich,	Washington Irving.
Lady, A,	Mrs. Julia Ward Howe.
Lady, A,	Jane Austen.
Lady of Massachusetts,	Mrs. Lydia Maria Child.
Laicus,	Rev. Lyman Abbott.
Langstaff, Launcelot,	Washington Irving.
Last of the Fathers,	St. Bernard.
Last of the Goths,	Roderick of Spain.
Last of the Romans,	Aetius, a Roman general.
Last of the Tribunes,	Cola di Rienzi.
Laughing Philosopher,	Democritus of Abdera.
Laurence Slingsby,	George Henry Lewes.
Lee, Vernon,	Violet Paget.
L. E. L.,	Letitia Elizabeth Landon; Mrs. Maclean.
Leviathan of Literature,	Dr. Samuel Johnson.
Liberator, The,	Simon Bolivar.
Light-Horse Harry,	General Henry Lee.
Lion of the North,	Gustavus Adolphus.
Little Comedy,	Catharine Horneck; Mrs. Bunbury.
Little Corporal,	General Bonaparte.
Little Giant,	Hon. Stephen A. Douglas.
Little Mac,	Gen. George B. McClellan.
Little Magician,	Hon. Martin Van Buren.
Little Master,	Hans Sebald Behan.
Little Thomas,	Thomas Moore.
Lothrop, Amy,	Anna B. Warner.
Loti, Pierre,	Louis M. J. Viaud.
Ludlow, Johnny,	Mrs. Henry Wood.
Luska, Sidney,	Henry Harland.
Lyall, Edna,	Miss Ada Ellen Bayly.
Lycidas,	Edward King.
Maartens, Maarten,	J. H. W. Van der Poorten Schwartz.
Maclaren, Ian,	Rev. John Watson.
Mad Anthony,	General Anthony Wayne.
Madman of the North,	Charles XII. of Sweden.
Maid of Orleans,	Joan of Arc.
Maid of Saragossa,	Augustina Zaragoza.
Maitland, Thomas,	Robert Buchanan.
Malachi Malagrowther,	Sir Walter Scott.
Malet, Lucas,	Mrs. Harrison.
Man of December,	Napoleon III.
Man of Destiny,	Napoleon Bonaparte.
Man of Ross,	John Kyrle.
Mantuan Swan,	Vergil.

Market Gardener, A,	R. D. Blackmore.
Marlitt, E.,	Henriette Eugenie John.
Mars, Victor de,	Joinville.
Marshal Forward,	Field Marshal von Blucher.
Marvel, Ik,	Donald Grant Mitchell.
Mathetes,	John Wilson.
Matthaeus, Thomas,	John Tindal.
May, Sophie,	Rebecca Sophia Clarke.
Meredith, Owen,	Lord E. R. Bulwer Lytton.
Merlin,	Lord Tennyson.
Merriman, Henry Seton,	Hugh S. Scott.
Merry Monarch,	Charles II. of England.
Merrypebble, Mr.,	Wm. E. Gladstone.
Mill-boy of the Slashes,	Henry Clay.
Miller, Joaquin,	C. H. Miller.
Miller, Olive Thorne,	Harriet Mann Miller.
Moderator,	Thomas Chatterton.
Modern Messalina,	Catharine II. of Russia.
Monk, Lewis,	Matthew Gregory Lewis.
Morley, Mrs.,	Queen Anne.
Morning Star of the Reformation,	John Wiclif.
Morris, Peter,	John Gibson Lockhart.
Mother Ann,	Ann Lee.
Muhlbach, Luise,	Mme. Klara (Muller) Mundt.
Nasby, Petroleum V.,	David Ross Locke.
Nero of the North, The,	Christian II. of Denmark.
Nesbit, E.,	Mrs. Hubert Bland.
Noble Lord, A,	Lord Byron.
Nobleman, A,	Oliver Goldsmith.
North, Barclay,	William C. Hudson.
North, Christopher,	Prof. John Wilson.
Northern Herodotus,	Snorro Sturleson.
Novalis,	Friedrich von Hardenberg.
Octogenarian, An,	Walter Savage Landor.
O'Down, Cornelius,	Charles Lever.
Officer, An,	Major Alexander Jardine.
Ogilvy, Gavin,	J. M. Barrie.
O'Hara Family,	J. and M. Banim.
Old Bachelor, An,	George William Curtis.
Old Bard, The,	Edw. Jerningham.
Old Bullion,	Col. Thomas Hart Benton.
Old Ebony,	William Blackwood.
Old Hickory,	Gen. Andrew Jackson.
Old Noll,	Oliver Cromwell.
Old Public Functionary,	James Buchanan.
Old Rowley,	Charles II. of England.
Oldstyle, Jonathan.	Washington Irving.
Only, The,	Jean Paul Friedrich Richter.
Optic, Oliver,	William Taylor Adams.
O'Rell, Max,	Paul Blouet.
Oriana (*Oriens Anna*, The Dawning Anna),	Anne, queen of James I.
Otis, James,	James Otis Kaler.
Ouida,	Louise de la Ramee.
Pacificus,	Alexander Hamilton.
"Pansy,"	Isabella Macdonald Alden.
Papaverius, Thomas,	Thomas De Quincey.
Parley, Peter,	Samuel G. Goodrich.
Partington, Mrs.,	Benj. P. Shillaber.
Pathfinder of the Rocky Mountains,	Maj. Gen. John C. Fremont.
Pattieson, Peter,	Sir Walter Scott.
Paul,	Sir Walter Scott.
Paul, Jean,	Jean Paul F. Richter.
Peasant Bard,	Robert Burns.
Pellegrin,	Lamotte Fouqué.
Pendennis, Arthur,	W. M. Thackeray.
Pennsylvania Farmer,	John Dickinson.
Pfaal, Hans,	Edgar Allan Poe.
Philosopher of Malmesbury,	Thomas Hobbes.
Plon-Plon,	Prince Napoleon Joseph Charles Bonaparte.
Plymley, Peter,	Sydney Smith.
Polish Byron, The,	Adam Mickiewicz.
Poor Richard,	Benjamin Franklin.
Porcupine, Peter,	William Cobbett.
Pretender, The Old,	James Francis Edward Stuart.
Pretender, The Young,	Charles Edward Stuart.
Prince of Destruction,	Tamerlane, *or* Timour.
Protestant Pope,	Pope Clement XIV.
Prout, Father,	F. S. Mahony.
Q.,	Douglas Jerrold.
Q.,	Arthur T. Quiller-Couch.
Quad, M.,	Chas. B. Lewis.
Quaker Poet,	Bernard Barton.
Quaker Poet,	John Greenleaf Whittier.
Quarles,	Edgar Allan Poe.
Queen of the East,	Zenobia of Palmyra.
Quir, Peter de,	John Henley.
Quixote of the North,	Charles XII. of Sweden.
Quiz,	Charles Dickens.
Rail-splitter, The,	Abraham Lincoln.
Rare Ben,	Ben Jonson.
Republican, A,	Charles Pinckney.
Reybaud, Mme. Charles,	Henriette Arnaud.
R'Hoone, Lord,	Honoré de Balzac.
Rita,	Mrs. E. M. J. von Booth.
Rohan,	Koda Nariyuki.
Ross, Adrian,	A. Reed Ropes.
Rough and Ready,	General Zachary Taylor.
Roving Englishman,	Hon. E. C. Grenville-Murray
Royal Martyr,	Charles I. of England.
Royce, Ashley Allen,	Nathaniel Hawthorne.
Runnymede,	Benjamin B. Disraeli.
Rupert of Debate,	Earl of Derby.
Rusticus,	J. K. Fowler.
Sailor King, The,	William IV. of England.
Salem, Hezekiah,	Freneau.
Samian Sage,	Pythagoras.
Sand, George,	Madame Dudevant.
Sand, Jules,	Jules Léonard Sylvain Sandeau.
Saunders, Richard,	Benjamin Franklin.
Sauzade, John S.,	James Payn.
Savonarola, Jeremy,	Francis S. Mahony.
Scottish Solomon, The,	James VI. of Scotland, and I. of England.
Scourge of God,	Attila, king of the Huns.
Scriblerus, Martinus,	Swift, Pope, and Arbuthnot.
Scriblerus Secundus,	Henry Fielding.
Semiramis of the North,	Margaret, daughter of Waldemar III. of Denmark.
Semiramis of the North,	Catherine II. of Russia.
Seraphic Doctor,	St. Bonaventura (1221-1274).
Sharp, Luke (Look Sharp!),	Robert Barr.
Single-speech Hamilton,	William Gerard Hamilton.
Slick, Sam,	Hon. T. C. Haliburton.
Slingsby, Philip,	N. P. Willis.
Smith, T. Carlyle,	John Kendrick Bangs.
Soldiers' Friend,	Frederick, Duke of York.
Sparks, Timothy,	Charles Dickens.
Stella,	Miss Esther Johnson (so called by Swift).
Stonewall Jackson,	Thomas Jonathan Jackson.
Subtle Doctor,	Duns Scotus.
Swan, Annie S.,	Mrs. Burnett Smith.
Swan of Cambrai,	Fenelon.
Swedish Nightingale,	Jenny Lind (Madame Goldschmidt).
Sweet Singer of Israel,	King David.
Sword of God,	Khaled (582-642).
Sylvander,	Robert Burns.
Syntax, Dr.,	Wm. Combe.
Templeton, Laurence,	Sir Walter Scott.
Teufelsdrockh,	Thomas Carlyle.
Thanet, Octave,	Alice French.
Thomas, Karl,	Karl Thomas Richter.
Thurston, Henry T.,	Francis Turner Palgrave.
Tippecanoe,	General W. H. Harrison.
Titcomb, Timothy,	J. G. Holland.
Titmarsh,	W. M. Thackeray.
Toby,	Chas. Dickens.
Toby,	Jonathan Swift.
Twain, Mark,	S. L. Clemens.
Two Brothers,	Alfred and Charles Tennyson.
Uncle Remus,	Joel Chandler Harris.
Uncommercial Traveller,	Chas. Dickens.
Universal Doctor,	Thomas Aquinas.
Upper Servant, An,	Jonathan Swift.
Vagabondia,	Frances Hodgson Burnett.
Valens,	Richard Burke.
Vandergrift, Margaret,	Margaret T. Janvier.
Venerable Nestor Ironsides,	Richard Steele.
Viator Vacuus,	Thomas Hughes.
Vicar of Bray,	Rev. Symon Symonds.
Violinist, A,	Eric Mackay.
Virgin Queen, The,	Queen Elizabeth.
Voltaire,	François Marie Arouet.
Wagstaff, Simon, Esq.,	Jonathan Swift.
Ward, Artemus,	Charles F. Browne.
Wetherell, Elizabeth,	Susan Warner.
Winter, John Strange,	Mrs. Henrietta E. V. Stannard.
Wizard of the North,	Sir Walter Scott.
Yellowplush, Charles, Esq.,	W. M. Thackeray.
Yendys, Sidney,	Sydney Dobell.
Yorick,	Laurence Sterne.
Z. Z.,	Louis Zangwill.
Zeta,	J. A. Froude.

OUTLINES OF INTERESTING BOOKS.

Often it is necessary to know something about a certain book before one begins to study it. The outlines given below are not designed to include all the world's great books, but some of those best adapted to the general reader. Many of them are well known to students in our schools, and others may be used for home or supplementary reading. Great care has been exercised in the choice of titles for interest, adaptability to young and old readers alike, and genuine moral and educational worth. Not all the books in the list could be called English classics; for many have been noticed because of their human appeal and easy readability. Only those foreign works have been mentioned which all the world acknowledges as beyond the narrow interests of one nation or one people. The main purposes of the selection may be thus summarized:

1. To introduce growing youths to some of the best literature.
2. To provide interesting books for reading outside of school.
3. To guide older persons to good reading for their leisure hours away from the office and the manufactory.
4. To summarize only those works, characters, and plots that have genuine human appeal.
5. To represent the great moral forces of the world, excluding every word that is not educational and character building.
6. To show in brief outline what the books themselves contain.
7. To exalt above everything else wholesome character, heart and soul interest, and appeal to a large circle of readers.
8. To enable the student, to gain the important facts of each synopsis easily, the writer's nationality, when he lived, why famous. To learn why his work was famous, as, his style, why his work is significant, to learn the type, the character of the work with ease.

Abbott, The, by Sir Walter Scott, combines history with romantic fiction. The historical portions describe the virtual imprisonment of Mary Queen of Scots at Loch Leven Castle on an island in a lake north of Edinburgh. Apart from Mary, some of the main characters are Roland Graeme, a noble stripling; his mysterious mother, who plays the part of sibyl; Catherine Seyton, Mary's waiting maid; and George Douglas, who is romantically faithful to Mary. Some of the best scenes show the early life of Roland, the forced abdication of Mary by command of the Scotch nobles, the escape at dead of night from Lock Leven, and the final adandonment of the cause—when Mary leaves for France. Roland at times is greatly mystified, but, when his loyalty is confirmed by his actions, he shares the secrets of the flight of Mary, actively assists, and finally wins the love of the elusive Catherine.

Abou Ben Adhem, a short poem by Leigh Hunt, teaches the lesson of love for one's fellow man. When Abou first saw an angel writing the names of those who loved the Lord, he asked if his was in the angel's "book of gold." When the angel replied that it was not, Abou said, "Write me as one who loves his fellow men." The next night, when the angel opened the book, Abou's name led all the rest. The line just quoted is carved on the monument to Leigh Hunt in Kensel Green Cemetary in England.

Absalom is the symbolical name given the Duke of Monmouth by Dryden in *Absalom and Achitophel.* His father, Charles II, is named David, and the first Earl of Shaftsbury, called Achitophel, is described as trying to act as a false friend to David. Using this parallelism with the story of David and Absalom in the Scriptures, Dryden built up an elaborate satirical poem, one of the most brilliant, but also one of the most bitter in our language.

Absolute, Sir Anthony, is a crochety, overbearing, and suspicious character, outwardly, but at heart somewhat kind and generous, in *The Rivals,* a satirical drama by R. B. Sheridan. As a picture of such a type, this is admirable and often mentioned by lovers of the older drama of sentiment.

Acadia or Acadie, the old and now poetic name of Nova Scotia, was derived from one of the Indian names given to rivers. In 1755 the French inhabitants, charged with disloyalty, were removed by English soldiers and transported to various parts of the United States. This incident gave rise to the beautiful story of *Evangeline* as narrated by Longfellow.

Acres, Bob, a boastful but timid country fellow in Sheridan's comedy, *The Rivals,* who swears large genteel oaths but refuses to fight a duel with his rival to defend himself from the charge of cowardice.

Adams, Abraham, is as kindly a clergyman as he is impractical, in Fielding's *Joseph Andrews.* He makes numerous laughable and awkward blunders of speech and manner, but is truly lovable, generous, and simple as a child.

Adonais is a beautiful elegy written by Shelley in 1821, when he learned of the death of John Keats. It was then reported that certain harsh criticisms of the poetry of Keats hastened his death in Rome. Though this idea was largely erroneous, Shelley made it the basis of some noble invective in his poem. Our chief regard, however, is for the beautiful lyric spirit of the whole, the descriptions of Keats as a part of nature,—though objectionable as theology are pleasing as poetic sentiment—and of the final conclusion of Shelley that Keats is still "a presence to be felt in darkness and in light."

Aeneid, the great Latin epic by Vergil, gives a detailed account of the life of Aeneas, founder of Italy, after his escape from Troy following the defeat of Priam and his sons in the Greek war. In twelve books the author includes many old story fragments. In the confusion of flight, Aeneas loses his wife, but manages to bear away his aged father, Anchises, and his own son. After mistaking the import of an oracle at Delphi, the hero leaves Thrace for Crete, being driven finally on the shores of northern Africa at Carthage. Here he is hospitably received by Dido, to whom he recites the story of his previous wanderings. Book two tells of the capture of Troy through the device of the wooden horse of Sinon, in which soldiers were carried into the heart of the town. Book three brings up the story to the death of old Anchises and the landing of Aeneas at Carthage. Dido falls hopelessly in love with the visitor, but he departs on his travels, leaving her to die a suicide. Books five to seven describe the sojourn in Sicily, the visit to the infernal realm, and the arrival in Italy. At last he wins the love of the daughter of the king of the region, who has been betrothed to Turnus, a noble of the country. War now ensues between the armies of the two rivals. Turnus makes a spirited attack on the camp of Aeneas, burns the enemy ships, and finally challenges the Trojan to a moral combat, in which Turnus himself meets death. At the end of the epic, the death of Aeneas, too, is fully described when he is killed in a battle with the Rutulians, after having governed the country since the death of his wife's father. A simple outline of the plot gives little idea of the wealth of the descriptions, the vitality of the narrative, and the beauty of many noble passages.

Aladdin, son of a poor widow in China, falls into possession of a magic lamp and a wishing ring. Through these, aided by a genie, who appears at his command, he wins the daughter of the Sultan, builds a fine palace, and has everything that heart could wish. When he loses the lamp, the princess and their possessions are transported to Africa. Again the genie of the ring helps him reclaim the lamp and all that he has lost.

Alhambra, The, by Washington Irving, 1832, is a series of sketches and tales of the old Moorish palace at Granada in Spain. All the romance of the ancient days, and many legends of the castle and town, invest the whole with peculiar glamor and charm. Some of the wonderful pictures show the Hall of the Ambassadors in the Alhambra, the Court of Lions, the mysterious chambers, and the gala days of the old city. Among the enchanting legends are those of the Moor's Legacy, the Three Beautiful Princesses, and Governor Mancho and the Soldier. For graceful and romantic coloring, they have long been highly appreciated by critical readers.

Ali Baba and the Forty Thieves, like the story of Alladin, is one of the fascinating tales that now go under the name of the *Arabian Nights.* Kassim married a rich wife; his brother, Ali Baba, a poor one. To escape a band of robbers, Ali Baba, who was a wood chopper, once took refuge in a tree. While there he overheard the captain of the band informing others that a certain place in the hillside would open when one pronounced the magic words, "Open Sesame." Thus having the secret, he found a cave filled with gold and treasure, a share of which he took home with him that day. Kassim, the brother, learning part of the secret, went to the cave, but cried, "Open Barley," "Open Wheat," and so on, and never gained access to the robbers' cave. Yet he was discovered there and slain. The robbers, guessing that Ali Baba knew their secret, tried various schemes to punish him. These were all brought to naught by a female slave in the home of Ali Baba. All the robbers finally were decoyed to town and there slain by a clever device.

Alice in Wonderland is a whimiscal tale by Charles L. Dodgson, an English mathematician, writing under the name of Lewis Carroll. A normal English lassie follows a rabbit down his hole, and, after a time, finds herself in a wonderful country, in the midst of strange and droll adventures. She becomes acquainted with various beings, including the March Hare, a Mad Hatter, a Mock Turtle, a strange Caterpillar, Pig and Pepper, a cranky Duchess, and the King and Queen of Hearts, in their court with animated cards. Alice at last finds herself in a court, where the jury is investigating "who stole the tarts." Finally, someone suggests that sentence should be pronounced, after which a verdict may be reached. Alice protests that by this means the proceedings are reversed from those of well-regulated courts of justice. She remarks to the Queen of Hearts that the people around are only cards anyway. At this the whole pack rises in the air and tumbles upon Alice, and she awakens to find it all a dream. Through a Looking Glass, a sequel dream, takes Alice through a mirror to a land where the people are chessmen, moving up and down over the squares of turf as men of a real chessboard. At a climax to a new series of adventures, Alice is crowned queen, realizes the absurdity of it all, and again awakens.

Allan-a-Dale, according to an old ballad, desired to marry a fair dame, who was betrothed against her will to another suitor. Robin Hood and his men appeared at the wedding, displaced the bridegroom, led Allan to the altar, and married him and the lady, after Friar Tuck had pronounced the bans seven times, instead of the usual three. Allan, in Scott's *Ivanhoe,* is a harper to Robin Hood.

Allworthy, a kind country squire, is pictured by Fielding as the foster parent of Tom Jones. The author remembered a friend, Ralph Allen, in his good-natured and benevolent character study. See *Tom Jones.*

Alton Locke, a social novel by Charles Kingsley, illustrates the humanitarian movement of the nineteenth century. Published in 1851, it shows how a humble man rose from the ranks of the sweat shop to be a poet and leader of his fellows. Besides the hero, a noble group of unselfish friends makes profound impression on England for many years. Some of the realistic descriptions of workers in England are profoundly impressive, and many of them are deeply pathetic.

Amaryllis is the conventional name for a rustic lass or shepherdess in many nature and pastoral poems from Vergil to the present.

Amelia, a realistic novel by Henry Fielding, was published in 1751. The heroine, whom Thackeray pronounced "the most charming" feminine creation in our fiction, is strongly contrasted with her weak and ignoble husband. Some of the powerful scenes of the book show Booth, the husband, in jail or in his own home, drunk, surrounded by his little children playing innocently. While in prison, he has a notorious Miss Matthews as a companion, who was sentenced for murdering a man that betrayed her. Through the patient love and long-suffering labors of Amelia, he is reclaimed, and the family enjoys many days of happiness in better fortunes.

American, The. This novel by Henry James, published in 1877, is probably the most readable of his early long stories. Christopher Newman, a self-made American on vacation, is trying to acquire some culture in Europe. He is willing to buy any work of art that shows taste. Madame de Cintre, a beautiful widow who is half English and half French, attracts him powerfully. After a time the family of this lady in Paris consents to allow Newman to become a suitor, and finally to think of him as a member of the household. They desire his money, but at last decide that they cannot tolerate him, or indeed any man who has made money manufacturing wash tubs. Through an old servant Newman discovers that the mother of Madame de Cintre has helped her own husband out of this world. This knowledge he attempts to use to assist him to reclaim his betrothed, but she flees from him in consternation and enters a convent, out of fear of the members of her family. Newman returns to America. This story, like others by Henry James, contrasts the manners, customs, and ideals of a highly cultured with a virile but somewhat raw society.

Amoret, the type of faithful wife in Spenser's *Faerie Queen,* is imprisoned by a false enchanter, who has tricked her into his power. Through many trials she remains firm and true. The name is also found in Fletcher's pastoral, *The Faithful Shepherdess;* and the name *Amoretti* was chosen by Spencer for the group of sonnets written in honor of his wife.

Anabasis, The, tells the story of the retreat of the Greek army from Persia, 401–399 B. C. Cyrus, the younger, employed some Greek mercenaries to help unseat his brother, Artaxerxes, from the royal throne of Persia. After several battles, just as final success was assured, Cyrus was killed in the fight at Cunaxa, leaving his hosts leaderless. Nearly all the other generals were then killed in an ambush when they were summoned supposedly to confer with Artaxerxes regarding terms of peace. Xenophon, a Greek without military rank, volunteered to lead his countrymen to their homeland. Under his guidance the remnant of the army crossed the hot sands of Arabia, the snowy mountains of Armenia, and the plains infested by hostile Persians and Kurds, until at last they came to Trebizond. Many of the survivors finally reached Greece, but a large number took service in Asia Minor, helping to free some of the Greek cities from foreign domination. Xenophon, in his *Anabasis,* using the third person for the narrative, recounts the story of the cities, peoples, mountains, military adventures, and amusing incidents of the retreat. Many parts are fascinating and almost modern in spirit.

Ancient Mariner, The. In 1798 the poets Coleridge and Wordsworth brought out a collection of *Lyrical Ballads,* and reached the high-water mark of romantic feeling in the literature of the age. Coleridge's *Ancient Mariner* at once attracted both favorable and hostile attention, eventually becoming an acknowledged imaginative classic. The poet revived an old story such as found in the tales of the Flying Dutchman, the account of a sailor condemned to wander because of some sin. Thus the ancient sailor in the poem at times is compelled to unburden himself to anybody whom he can force to listen, while he holds his hearer spell-bound.

Everything goes well on board the mariner's ship until they drift into great fields of ice in the southern seas. Day after day an albatross follows in their path. Finally, in an idle moment of wickedness, the mariner shoots the bird with his cross bow. At once all his superstitious companions begin to hate him, because of the evil destiny that would follow their ship. They hang the bird around the mariner's neck. One by one all drop down dead on the deck, leaving the mariner all alone in the midst of living death. Everything else takes on life, while the ocean swarms with odd and uncanny creatures. In contrast to the mariner, these creatures seem happy. Distress of body, mind, and soul become terribly intense. At last two specters dice for the ancient mariner's soul. These are called Death and Death-in-Life, and the latter wins, while the mariner begins anew his living death. Everything now seems to rot; ghastly gleams flit about the ship, and ghosts appear at night; no rain falls for many, many days. Only at last is the spell broken by true repentance and prayer, when the mariner falls down in agony on the deck and begs forgiveness for killing one of God's fellow creatures. Then the albatross drops from his breast, beginning the restoration of something like normal life on board the ship. As the craft nears the shore, the dead men rise up, resume their stations, and the mariner leaps for joy on seeing lights along the land.

Few poems in English equal *The Ancient Mariner* in vivid and dramatic touches. Originality, picturesque diction, an atmosphere of mystery, a narrative forged white-hot are the main characteristics. Some of the figures of speech, flights of imagination, and romantic colorings make this poem also unique in our language.

Andrea del Sarto, a dramatic lyric by Browning, introduces us the life of artists and their works in the flowering of art in Florence. Andrea (son of a tailor) was called the faultless painter, because his drawing was so delicate and true. Yet the man himself lacked soul, and his works seem unreal and inhuman. Browning makes the painter explain his own failure. His wife is model for many of Andrea's best works, but she is soulless and unfaithful. Perfect in form, both she and the pictures

lack the finer essence of nobility. Andrea tries to explain his failure by charging it to his wife, but Browning shows that much of the fault lies in the painter himself. See Browning's other art poems, *Fra Lippo Lippi, Old Pictures in Florence, Pictor Ignotus.*

Annus Mirabilis by Dryden is our best poem in heroic stanzas,—four lines of five feet each, riming alternately. Gray in the *Elegy* and Byron in much of his work followed this form. For imagination, terseness of phrase, and ease of movement Dryden's poem excells. He describes the London fire and the Dutch war in the wonderful year, 1666.

Apologia Pro Vita Sua by John Henry, Cardinal Newman, was written to justify his change of faith from that of the Church of England to the Church of Rome. Having been attacked by Charles Kingsley, among others, for leaving the established church, Newman in 1865 gave the world this wonderfully frank and detailed history of his religious experiences. The *Apologia* is justly famous for its spiritual insight, logical arguments, and earnest vindication of Newman from any charge of being a mere turn-coat. In literary style the work keeps pace with the subject matter.

Apparition of one Mrs. Veal is a ghost story by Defoe, dating from 1706. To the readers who then believed in the return to our earth of departed spirits, this simple, honest narrative made a profound appeal. To us it shows the typical methods of Defoe in putting every touch on his work to make it seem truthful in all regards. Mrs. Veal, "a maiden gentlewoman," a victim of "fits" was living unhappily with her brother not far from the home of a certain Mrs. Bargrave, who afterward told the story. These religious ladies often spent hours together reading works of spiritual consolation. They held common beliefs of the hereafter. Finally, Mrs. Veal moved to a distant town, and Mrs. Bargrave saw little of her from that time until one day, not long after noon, her old friend came to call, but she seemed not quite herself, passing her hand over her eyes at times, and suddenly breaking off in her conversation. They talked together for some time. Afterward Mrs. Bargrave was amazed to learn that Mrs. Veal had died shortly before her ghost appeared for this parting visit.

Arabian Nights, The. Early in the eighteenth century a French scholar named Galland translated an Arabic manuscript of the *Thousand and One Nights.* From time to time certain oriental stories have been added in various editions. The time of the stories ranges from the eighth to the sixteenth century, but many of them undoubtedly go back several hundred years in oral tradition at least. They belong to the older type of frame collection,—a list of stories joined by some series of events connected with the time and manner of telling them. The *Nights* were supposed to be some stories told by a princess. She had married an eastern potentate to save her sisters; for this absolute monarch decreed that each wife should be executed on the second day after their marriage. To prolong her life, the princess began a story each evening, but never finished it till another night. After a thousand and one nights the emperor decreed that his entertaining wife should live forever, as she indeed does in these wonderful tales.

Arcadia, Sir Philip Sidney's lengthy pastoral romance, was published in 1590, four years after the author's death. Sidney was banished from the court in London to the home of his sister, the Countess of Pembroke, and for her he wrote this story, with no thought of publication. It is a long, rambling, unrevised narrative, but here the ancient and the modern world meet in vivid life. Both pagan and Christian heroes associate on terms of intimacy and friendship. The demi-gods of Greece appear in medieval dress, speak modern languages, and tilt with heroes of chivalry. Page after page succeeds in ever-changing delights. It is a book to be read at leisure, part by part, story by story, and not as a connected novel.

Archimago, a clever magician in *The Faerie Queen,* a poem by Edmund Spenser, separates the Red Cross Knight and Una through deceit. He appears in a number of disguises, to represent hypocrisy as opposed to truth and honor.

Areopagitica, which contains some of John Milton's best prose writing, is a "Speech on the Liberty of Unlicensed Printing." This was prepared as if spoken to Parliament in defense of printing without a government license. Some of the poet's own pamphlets were issued contrary to the wish of the official licenser. Milton argues with great eloquence and fervor that difference of opinions should not justify refusing a license to any work not contrary to the sense of morality or of political expediency. He cites classical works to show that only immoral doctrines and traitorous utterances, especially blasphemy against the gods, were forbidden. Mere party differences, or doctrines contrary to the party in power, or to the opinions of the majority, should not be allowed to throttle free speech.

Artful Dodger, The, is a criminal named John Dawkins who skilfully eludes the police at every turn. Dickens shows how this man with his fellow's tries to make a criminal out of the hero in *Oliver Twist.*

Arthurian Cycle of Romances. This is a general name for a group of several different legends bound into a whole by some old English chroniclers. Though Arthur is the central knight, five or six other characters share the honors with him in the Round Table. The chief parts are the stories of Merlin, the magician; Gawain and other perfect knights like Galahad and Percival; the story of Lancelot and his romantic love affairs with Elaine and especially with the Queen, Guinevere; the religious legend of the Holy Grail, the cup from which our Lord, according to an ancient story, drank at the Last Supper; the tragic love tale of Tristram and Iseult, sometimes a part of the cycle. Malory's *Morte d'Arthur,* in prose, and Tennyson's *Idylls of the King,* in verse, represent both an old and a recent version of some of these tales, which have been used by many authors in both French and English.

Ashton, Lucy, tragic heroine of Scott's novel, *The Bride of Lammermoor,* which is described on a later page.

As You Like It, one of Shakespeare's most delightful comedies, is as fresh and simple as the Forest of Arden, in which some of the scenes are enacted. Though composed of three different elements, the plot is easily understood, fairly probable, and decidedly romantic. The old duke, banished from court by a usurping brother, lives in idyllic ease among the rangers and visitors who come to do him honor in his forest retirement. By his consent Rosalind, his beloved daughter, has remained at court as a companion for her cousin, Celia, daughter of the usurping Duke Frederick. A strong youth named Orlando, being hated by his brother, engages in a wrestling match with a champion, who has really been sent to put him out of the way. Orlando, because of a victory over this wrestler, is banished by his brother, but he has already won the favor of Rosalind. Duke Frederick, too, is furious, because Orlando is not to his liking, and he banishes Rosalind. Disguised as a shepherd, with Celia and Touchstone as companions, she at last arrives at the sylvan court of the banished Duke. Orlando has met them in the forest, but has not recognized the party. At last everything turns out well, including the repentence of Orlando's cruel brother and of the usurping duke.

Besides the artificial elements of the pastoral, this drama presents some real rustics in William, a simple fellow, who thinks he is to marry Audrey, a tittering wench, until Touchstone persuades him of his mistake. Jaques, a wilful man of wit and melancholy, makes wise comments on the vanity of human life; Touchstone, one of the funniest and also one of the wisest of the Shakespeare clowns, adds a delightful spirit of fun. Few dramas have such a pleasing out-of-door atmosphere.

Aurora Leigh, an ethical story in poetic form, issued by Mrs. Elizabeth Barrett Browning in 1857, reveals what the author called her "highest convictions on life and art." The moral and religious tone of the work of this lady was never so highly developed as in this noble poem. Aurora, a creature of wealth and society, has been brought up by a maiden aunt. She refuses to marry her rich cousin, Romney, because he has socialistic ideas. At last she is brought to realize that she should marry him when he accidentally becomes blind.

Autocrat of the Breakfast Table, a series of witty, rambling, and delightful conversations, brings out several typical characters, the chief one being the leader of the group, who is called the autocrat. Some of the others are the Schoolmistress, the Old Gentleman Opposite, the Landlady and her Daughter, the Young Man John, the Poor Relation, and the Divinity Student. O. W. Holmes, the author, illustrates many topics of interest in art, literature, science, and politics of the middle of the nineteenth century. For a number of years his collection of genial, personal essays in this volume set the fashion for discourses on many familiar subjects.

Baconian Theory, The, assigns the Shakespeare plays and other Elizabethan works to the authorship of Francis Bacon, a philosopher and politician, who wrote several learned treatises. Since the middle of the last century, the battle has raged, with the writing of many books and the spinning of many elaborate arguments. All of the evidence is negative. Advocates of the Baconian theory cite the small education of Shakespeare, the merit of

Bacon as a thinker, the dark problems of the *Sonnets*, which seem to fit into what we know of Bacon's life, and especially the piecing of various words and phrases into a so-called Bacon cypher that is claimed to reveal many secrets.

Bacon's Essays, fifty-eight in number in the last of several editions during the life of Francis Bacon, are indisputably his work. They summarize his opinions on many subjects in terse sentences, which more closely resemble modern forms of writing than those of Bacon's own time. Some of the essays are highly polished; others appear in what seems a rougher state of thought and language. Bacon's counsel on the reading of books should be framed for every schoolroom: "Some books are to be tasted, others to be swallowed, and some few to be chewed and digested." Many sentences stand out forever in one's memory, like this one: "Men fear death as children fear to go in the dark," or this: "Revenge is a sort of wild justice." Bacon writes best on subjects like Adversity, Atheism, Friendship, Riches, Studies, and Revenge.

Barkis, the diffident stage-driver, asks David Copperfield to bear a simple message to Clara Peggotty. He believes this will be understood as a proposal of marriage. The phrase has become proverbial for willingness in general. It is, "Barkis is willin'."

Battle of the Books. This amusing satirical story by Dean Swift was called forth by a controversy in his time as to the relative merits of ancient and modern authors. The Bee, flying straight, symbolizes the classics; the Spider, always involved in a web, represents the moderns. These creatures begin a dispute in St. James Library. At last all the books join in, and a lively battle results, with much scattering of dust. Though Swift does not tell how the contest results, it is perfectly evident that he sympathizes with the ancients. By great shafts of his wit and ridicule, he strikes down many authors of his generation, not sparing even Dryden.

Battle, Sarah, is a lady in one of Charles Lamb's whimsical essays. She speaks of playing whist as her destiny, her born duty in life, and of reading as a pleasant diversion after business, a mere incidental pursuit.

Bedivere, one of the earliest knights created by King Arthur, is the last companion to leave him, when all others flee after the breaking up of the order of chivalry. Just before Arthur returns to the mere from which, as a babe, he came, Sir Bedivere is entrusted with the task of throwing his sword, named Excalibur, into the lake, where a white hand from the bosom of the water rises up and receives it. Tennyson's *Passing of Arthur* tells the story in lines of great musical and imaginative beauty.

Beggar's Opera, composed by John Gay and first used in 1728, was the earliest of that kind of musical play called variously ballad, light, or comic opera. With its tuneful lyrics and sparkling dialogue, it struck the popular fancy at once, and long remained a favorite on numerous stages. It often rivaled the more serious, Italian "grand" opera. Speaking of Rich, the manager of the playhouse when Gay's opera first came into notice, one wit said, "It made Gay rich, and Rich gay."

Belle Dame Sans Merci, La. This being translated means "The beautiful lady without pity." Though the name was old, the poet John Keats first wrote this story in all its romantic coloring and music. The ballad narrates the wandering of a knight, who met a lady in the meads and became enchanted forthwith. She took him to an elfin bower, sang a song of love and devotion to him, promised to love him truly; but the knight at last found himself on a cold hillside alone.

Benedick, a bluff and witty soldier in Shakespeare's *Much Ado about Nothing*, vows that he will remain a bachelor. The vivacious and sarcastic Beatrice, in spite of apparent contradictions on both sides, attracts his notice. Finally, some friends of both arrange to allow Beatrice and Benedict to overhear them tell that one is madly partial to the other. When Benedict at last announces that he will marry, his old friends taunt him, and say, "Behold, Benedick, the married man." The name, now usually spelled Benedict, is often used synonymously of a recently married man.

Ben Hur, General Lew Wallace's tale of the Christ, represents the noblest type of historical fiction with oriental setting. Early in the novel the three wise men bring their gifts to the manger at Bethlehem. Fifteen years afterward, Judah Ben Hur, now grown up, is living at Jerusalem with his mother and sister. One day, when the Roman governor is passing, Ben Hur crowds too near the edge of the roof to see him. A tile falls off and lands at the side of the governor. At once Ben Hur is arrested and condemned to the galleys for life. Messalla, his closest friend, deserts him in his great need. Later Ben meets John the Baptist, and is converted to the faith by seeing a miracle performed by Christ himself. Many fine passages of description bring ancient times home to us with tremendous vitality. Two of the most vivid episodes are the sea fight and the chariot race in the arena.

Beowulf is the oldest long epic in our language, and structurally is one of the best of all the ages. Its single manuscript, containing 3183 lines, is somewhat incomplete at the close. There has been much discussion as to whether the background is that of our England or of some other northern shore to the eastward of Britain. The language of the poem is old English, the predecessor of the speech before the time of the Middle Ages. From this narrative one gains an intimate idea of how our ancient forefathers lived and felt. Little is said of agriculture, and much of warfare. The story falls into two large parts, with episodes in each, but the whole is fairly unified, except for a break of several decades between the first and second parts. Beowulf, a bold superman, comes across the sea to defend his English friends from the ravages of a terrible monster called Grendel, who comes forth from the moor at night to carry off the thanes of the Saxon Hall. Beowulf traps Grendel, a terrific battle ensues, in which much of the furniture of the hall is wrenched from place. Beowulf at last wins, and Grendel skulks off, leaving one arm behind. The noble hero now follows him to his lair under the mere, and then finds the mother of Grendel, whom he crushes. After being feasted by the joyful thanes, Beowulf departs for his own shores, bearing rich gifts from the king and his nobles.

Late in life he comes forth once more and slays a terrible fire-drake that is burning up huge patches of country. In this last encounter he is mortally wounded and soon dies. At the end of the poem a lofty funeral pyre has been erected, and a beacon to mark the resting place of the hero has been set in place on a rocky shore. The imaginative background is wild and primitive, unchristian, and essentially fatalistic and heathen. For richness of language and compression of form throughout, this is a notable world epic.

Beside the Bonnie Briar Bush, by Dr. John Watson writing as Ian Maclaren, reveals the wholesome joys and sorrows in small Scotch communities. All the parts, or stories, of this book are sentimental, suffused with richest feeling, and simply told with powerful effect. There is poor Geordie Howe, dedicated to the ministry, but dead before his mother's best dream could be realized. There is Dr. Willum Maclure, the country doctor, truly one of God's noblemen, who risks life and health and spends his small earnings that a patient may have the best medical and professional attention. He is worthy of the warm praise of the great Edinburgh specialist, whom he has called to assist in saving a poor man's wife from death. There is dear old Domsie, the village schoolmaster, who lives in his boys, especially those he sends to college; he is determined to have his town represented in the University by a "lad o' pairts." There are the Rev. Dr. Davidson and many other sturdy villagers.

Biglow Papers, The, by James Russell Lowell, have been considered his most original contributions to the thought of his age. They comprise more than twenty verse letters, all full of humor, Yankee dialect, and shrewd observations of men and politics. Hosea Biglow, a quaint rustic, writes letters in verse, some of which are interpreted by others, including the Rev. Homer Wilbur. Even Birdofredum Sawin, a volunteer from Massachusetts in both the Mexican and Civil wars, has something to say that is typical and interesting. Lowell expresses the strongest anti-slavery sentiment of his time in these letters.

Black Beauty, the autobiography of a horse, as told by Anna Sewall, always engages our sympathy in favor of kindlier treatment of domestic animals. Brutally crippled by a drunken groom, a finely bred horse is sold to the keeper of a livery stable. In succession he passes on to be a cab horse, a cart horse, and a cab horse once more, until he finally is sold to a farmer, who soon recognizes his worth, nurses him back to robust health, and gives him a happy old age.

Blatant Beast, a terrible monster with a hundred heads, as described by Spenser, typifies slanderous tongues, or the rabble crying with many discordant voices.

Blessed Damozel, The, is a romantic poem full of imagery and symbolism, written by Dante Gabriel Rossetti and published in 1851 in its first form. In this and other descriptions, the poet, who was also a painter, tried to fuse the methods of the two arts. Both musically and metrically the work interprets the heart and soul of a young girl in Heaven, who leans out over the golden boundary and sighs for her lover on earth.

Blithedale Romance, The. Hawthorne in this narrative, published in 1852, remembers some of the events of the celebrated Brook Farm community, of which he was for a time a member. Though highly idealized as a romantic picture of the life at Brook Farm, the story introduces a mysterious Zenobia, whom many have identified as a picture of Margaret Fuller, the American mystic and editor. Zenobia falls in love with the leader of the experiment, who is too practical and unromantic to notice her growing regard for him until it is too late. His lack of understanding and coldness lead to the suicide of his mysterious friend, who shows resemblances, also, to Miriam in *The Marble Faun* by Hawthorne.

Boniface, a name now given to a landlord, came from a drama by Farquhar, in which there is a realistic picture of an inn-keeper named Boniface.

Bower of Bliss is the home of the witch Acrasia on a floating island as described in Spenser's *Faerie Queen.* The knight, Sir Guyon, being sent to destroy the place, succeeds only by catching Acrasia in a net. This name also occurs in Tasso's *Jerusalem Delivered* as a pleasure garden; and more recently it has been applied to any beautiful or artistic enclosure.

Braggadoccio, a boastful coward in *The Faerie Queen,* has bequeathed the name *brag* to describe high-sounding talk.

Bride of Lammermoor, The, is one of the most tragic stories of literature. Though the plot of betrayed love is conventional, Sir Walter Scott in his romance has made it livid with new interest. After the death of his father, Edgar Ravenswood falls in love with Lucy Ashton, whose father was the inveterate enemy of the elder Ravenswood. Edgar and Lucy meet, break a coin between them as sign of their troth, and part while Edgar goes abroad on state business. His letters to Lucy are intercepted, and the family succeeds in persuading her to marry Sir Arthur Bucklaw, a wealthy fop, whose money is needed. Just after Lucy has signed the contract of marriage, Edgar bursts into the hall at Ashton castle, inquires if she has consented of her own free will, and is answered by Lady Ashton that she has. Lucy seems to assent. Edgar goes out to prepare his revenge. Soon afterward Lucy, in a sudden fit of madness, slays the bridegroom, and finally falls in death, calling on the name of Edgar. Ravenswood runs upon the point of his sword among the tombs of his ancestors near by. Like other novels by Scott, this fiction furnished the basis for good acting plays, and for the celebrated Italian opera by Cammarano and Donizetti, called *Lucia di Lammemoor.* In the fine Sextette the music rises to sublime heights.

Buzfuz, a pompous and pedantic lawyer for Mrs. Bardell, bullies all the witnesses for Mr. Pickwick, who is being sued by the widow for breach of promise of marriage. See *The Pickwick Papers.*

Cædmon, often called the father of English song, is the earliest English poet known to us by name. At a religious house of Whitby, in north England, he often went to the stable when others at the feast were making merry and improvising songs. He was an unlettered man, with no gift of riming, until a vision came to him and bade him sing the story of the Creation. Other works, formerly attributed to him, seem now to have been the work of imitators or poetic pupils.

Canterbury Tales are the mature work of Chaucer, the greatest English singer before the Elizabethan age. They belong to the third quarter of the fourteenth century. This gifted poet made a new English from the broken older language, minus the case endings, and from the introduction of Norman words into the vocabulary. The *Tales* consist of stories taken from a number of sources, foreign and native, and woven into a common frame. Thirty pilgrims are going from London to the shrine of St. Thomas a Becket at Canterbury. On the way, as proposed by the witty host and leader, each member of the party is to tell two stories and two on the return trip. Only twenty-seven or eight tales are complete, however. They range all the way from the story by the knight of the party, who tells of Palamon and Arcite, two old lovers enamored of the same maiden, to the burlesque poem by Chaucer in which he made fun of the romances of chivalry. For kindliness, gentle satire, knowledge of human nature, musical and imitative poetry, and a broad view of life and society, these verse stories contain some of the best work before Shakespeare. They throw some light on customs and types of character in 1400.

Camelot is the seat of the court of King Arthur, in the south of England, described in many old romances of chivalry, as in the Welsh *Mabinogion,* Malory's *Morte D'Arthur,* and in modern poems like Tennyson's *Idylls* and *Lady of Shalott.*

Cassandra, daughter of Priam of Troy, foretold the disastrous end of the war with the Greeks; but, by decree of Apollo, whom she had offended, none of her prophecies were believed. Her name is now given to any foreteller of calamity or improbable event.

Castle of Otranto, published in 1764 by Horace Walpole, describes many fantastic adventures at an old Italian castle; it set the fashion for what is now called the Gothic Romance. Stories of this type picture mysterious dungeons in old ruinous castles, youths and maidens imprisoned or at least deprived of their rightful fortunes by some usurper or tyrant, with supernatural machinery, rescues in the moonlight, and indeed all varieties of romantic scenery. In *Otranto* the prophecy was made that the castle would fall when the rightful heir became too large to inhabit it. This ambiguous doom led to various peculiar events. An old gentleman, for instance, gravely walks down from the frame of his picture. Mysterious hands and gusts close doors and frighten garrulous servants, who scamper about confusedly. A statue sheds blood from the nose, and a gigantic helmet falls down and crushes the reputed heir to the Otranto estates. Yet the castle has been stolen by a usurper, who finally comes to grief, and the rightful peasant is given his due possession. See *The Mysteries of Udolpho* for another gothic story.

Castle Rackrent, 1801, is an account of an old Irish estate, as told in a short fictitious narrative by Maria Edgeworth. Thaddy Quick, for years a servant of the Rackrents, tells of the gradual decay of the family and mortgaging of the estate. Sir Patrick Rackrent was a gay entertainer, famed for magnificent hospitality and a large funeral. He was followed by Sir Murtaugh, a man of abstruse legal knowledge (which never helped his tenants any) and for a wife, one of the Skinflint family, who maintained a charity school for children who spun gratis for her. Next came Sir Kit, worse spendthrift than Sir Patrick, who locked his Jewish wife in her room for seven years because she refused to part with her diamonds to him. Sir Condy, the last, died from quaffing a large horn of punch on a bet, having already used up the rest of the ready money and sold much of the estate. This tale gives a vivid picture of land conditions in Ireland about 1782. A companion story, *The Absentee,* shows how peasants were ground down by factors, or agents of landlords living in England, some of whom never had seen their own estates across the Irish Sea.

Chevy Chase, an ancient ballad, celebrates the Battle of Otterburn of the year 1388, without adhering strictly to the real events.

Childe Harold's Pilgrimage is the most notable poem by George Gordon, Lord Byron. Childe is an old term of honor or romance; in the poem it signifies Byron himself. The four cantos of this narrative give us a fairly good bird's eye view of Europe. Byron describes most clearly some of the old Roman ruins, notably the Colisseum. The best passages are the account of the battle of Waterloo, written for a second part of Childe Harold, the ball on the evening before the battle, Lake Leman, Venice and the Bridge of Sighs, old Rome, and the wonderful apostrophe to Ocean at the close of the fourth part. The poem is full of the spirit of past centuries, picturesque touches, unrestrained action, melancholy, and posing for favor among Byron's countrymen. He sometimes turns aside from a magnificent scene to bemoan his own lot or to speak of the unkindness of the public.

Children of the Ghetto is one of several works by Israel Zangwill, an English author of Hebrew parentage. These reveal the life of the Jewish people in London, with much of tragedy and comedy. *A Rose of the Ghetto,* an amusing short story, tells of the marriage customs of some of the people of the Ghetto. His drama, *The Melting Pot,* attempts to show how all nations may be fused into one people, as in free America.

Circumlocution Office is a term used by Dickens to characterize official delays and the unwinding of "red tape." The name is used in *Little Dorrit.*

Clarissa Harlowe, second of three long fictions by Samuel Richardson, father of the modern analytic novel, 1751, presents powerfully two main types of character,—a polished but scheming profligate, and a noble heroine, who is driven to apparent wrong by unfortunate conditions in her home. For a time Clarissa, according to family command, refuses to encourage Lovelace, until her father insists that she must marry a country bumpkin whom she never could admire. Not knowing what to do, Clarissa allows Lovelace to become her escort to London, but he

violates his pledges to her, though he tardily offers her marriage. In disgrace, and heart-broken because everybody repudiates her, Clarissa dies in a poor but respectable lodging house in London. Colonel Morden, a cousin, vindicates her on the field of honor by killing Lovelace. This story, one of the world's tragic narratives, is told in form of letters from Clarissa and her friends, and from Lovelace to his chief male confidant. For intensity of emotion, poignancy of despair, and final resignation because of her innocence, Clarissa set the standard of sentimental novels for a generation.

Lovelace, on his side, was drawn as too engaging a villain to be sent to perdition. While the novel was being published in parts, Richardson received many letters from ladies, who begged him to reform and spare such a polished society man. Having been censured for a like change in *Pamela*, his first novel, the author wisely refused all these pleas; but later composed a third novel, *Sir Charles Grandison*, to show a noble and perfect gentleman. Men like Dr. Johnson and Macaulay have praised Clarissa for being one of the noblest heroines in literature.

Clinker, Humphrey. This is a realistic novel by Tobias Smollett. The hero, a Methodist postilion, finally attracts the kindly attention of Matthew Bramble, a squire traveling for his health through England. The story describes watering places, with much comic insight. Winnifred Jenkins, a maid in the family, entertains us with her bad spelling and amusing religious ideas.

Compleat Angler, 1653, by Isaac Walton, is a narrative giving an account of the proper ways of fishing. Besides the technical part, which is of interest still to anglers, the book contains quaint remarks on life and literature, a simple piety, and a joy of living in the out-of-doors. Many parts are a perpetual charm.

Comus, a masque by John Milton, was first enacted at Ludlow Castle, near the border of Wales, in 1634. This type of drama, including some historical, legendary, or fanciful scenes, tableaux, music, and sometimes dancing, formed a chief court entertainment in England in the reign of James I and later. Lawes, the eminent musician, arranged the music, and Inigo Jones, the celebrated artist, painted the scenes for *Comus*. Milton chose a theme quite familiar to him,—the conflict between good and evil. A Lady, Attendant Spirit, and Sabrina, the water nymph, embody the life of virtue and humanity; Comus, with his "rout of monsters, headed like sundry sorts of wild beasts," typifies materialism and the love of fleshly pleasures. Having lost her way in the forest, the Lady arrives at the abode of Comus, who endeavors to force her to drink a magic potion. She valiantly refuses, in spite of elaborate arguments by Comus, which represent the materialistic philosophy of Milton's age. Sabrina, the Attendant Spirit, and others, finally come to the rescue, and shame the false enchanter, who is described as a son of Circe. "Sweet echo, fairest nymph," and "Sabrina fair" were long popular among the songs of Comus.

Confessions of an English Opium Eater, published anonymously by Thomas DeQuincey, 1821, reveals the weaknesses and dreams of a man addicted to laudanum. The author bares his own heart and soul in many musical and intimate passages, so that this work soon won him recognition among the essayists of his age. Two of the best chapters in the *Confessions* are The Pleasures of Opium, and The Pains of Opium, showing the alternation of gorgeous dreams and high spirits with the utmost lassitude and depression of body and soul.

Cophetua, an African king, married an humble beggar maid because of her beauty and virtues. Percy's *Reliques*, a collection of old English poetry, quotes a ballad giving the story of the happy pair, which Tennyson repeats in his Beggar Maid.

Cotter's Saturday Night, The, a poem by Robert Burns, reveals the annals of the humble Scots peasant. The narrative tells of the return of the elder children to their father's house at the week-end, the coming of a suitor for their daughter, with the joy of the parents to find him "nae wild worthless rake," the simple fare around the board, and family prayers. "From scenes like these," says Burns, "old Scotia's grandeur springs."

Coverley, Sir Roger de, a lovable country squire, is one of the Spectator Club, a group of gentlemen said to be responsible for the papers written by Addison and Steele for the *Spectator*. Few descriptions of men in the eighteenth century are more delightful. Sir Roger is shown at church, at his country estate, at the club, at the theater, even in love, and finally in the last moments of his noble life. Before the novel came into being with Richardson in 1740, these papers, as near as anything else, anticipated modern analytic fiction in the kindly picture of Sir Roger and other men of the Club.

Cranford, a series of sketches by Elizabeth Gaskell, 1853, reveals the intimate affairs of a small English village, with kindly pictures of prim old ladies and their conventional and sedate ways. The story introduces us to Miss Matty Jenkins, her older sister, and various friends of theirs. There is a long-past love affair, the memory of which is as fragrant as old roses, with a romance of some young people of the town, and a return from India of Peter Jenkins, a long absent brother. The ladies of Cranford have their etiquet of calls, parties, teas, and the management of all the little affairs of life.

Damocles was an accomplished flatterer at the court of Dionysus of Syracuse. Tired of hearing of the fortunate condition of kings and princes, Dionysus had Damocles seated at a banquet, with a sword above his head hanging by a single hair. When the flatterer observed its keen edge, he decided it best to sing another song to the king. The phrase, the sword of Damocles, is now used for impending danger.

Darby and Joan, an old couple in England early in the eighteenth century, became known as a model husband and wife, who never had any quarrel or unpleasant words. Their happy life was described in a popular ballad, and they have become proverbial for contented married life.

David Balfour, a romantic novel by Stevenson and a sequel to *Kidnapped*, narrates the further adventures of a sturdy Scotch lad. He now succeeds in helping Allan Stuart to escape from England, but he himself gets into prison for trying to help Allan's brother, unjustly accused of murder. David has also fallen in love with Catriona Drummond, whose father is a scoundrel. After David's release from prison, for a time he and Catriona live in Holland, till they are separated by the scheming of her father. Eventually Allan Stewart assists them to meet and marry in Paris.

David Copperfield, published in 1850, was called by Dickens his "favorite child." This novel teems with interesting and droll characters, many of whom are sketches of persons known to Dickens in his London rambles. Though not strictly autobiographical, some of the chapters recall incidents in the early life of Dickens, such as the employment of David in Murdstone's warehouse.

Not a few of the characters of the book have taken their places in the gallery of life-like portraits in literature. The Peggotty group, in their humble kindliness, is made up of David's old nurse, who married the Barkis who was "willin';" her brother, a bluff, hearty old seaman, who adopted Ham and Little Emily, children of deceased relatives; and the housekeeper, Mrs. Gummidge, always crying for "the old one," as she described her late husband. David Copperfield's old schoolmate, James Steerforth, stole Little Emily away and broke her heart and ruined the entire family. Ham lost his life along the rocky shore trying in vain to rescue Steerforth from a wreck at sea. In the description of the tragedy of the Peggotty home, Dickens is at his best. The second group includes Micawber, famous for his long words and grandiloquent posing, the man who always waited for "something to turn up." Late in life he emigrated to Australia, taking Little Emily with him, and there they lived in peace and good cheer. The third group is composed of David, his kindly old aunt Trotwood, who once turned Mr. Murdstone, David's step-father out of her estate; David's weak but loving mother, who was completely subjected to Murdstone; his first child wife, Dora, a beautiful girl, but not a suitable companion; and his second wife, Agnes, who brought his success and urged him on to nobler endeavor.

This novel also contains the polished hypocrite, Uriah Heap, who is always assuming humility, and who all but wrecks the business of David Copperfield and his partners. Even the large group of subordinate persons is sketched with wonderful clearness and truth to nature,—the odd and humorous dwarf, Miss Mowcher; Mr. Mell and Mr. Creakle, the schoolmasters; Tommy Traddles, David's childhood friend and companion; the benevolent Dr. Strong; and the virulent Rosa Dartle, who tried in many ineffective ways to insinuate herself into the heart of David. All these portraits are drawn as only Dickens could touch them with life.

Davy Jones is the jocose name for the evil spirit of the sea, into whose "locker" the sailors fall when they die and are buried in the ocean, or perish in a great storm. Smollett's *Roderick Random*, contains an early reference, but the name must have been much older than the year 1751, when this nautical tale was published.

Decline and Fall of the Roman Empire, The, has frequently been mentioned as the most elaborate and scholarly historical work in English. Edward Gibbon, the

writer, spent many years in research in all the great cities of Europe, completing the last volume in 1787. For brilliance of conception and vividness of narrative, few similar works compare with the *Decline*. Except for a bias against Christianity, this work is almost faultless. Almost thirteen centuries are shown in bird's-eye view, ending with the fall of Constantinople to the Turks in 1453.

Dr. Jekyll and Mr. Hyde is Stevenson's tale of the double personality in mankind. This theme engaged his attention also in *A Lodging for the Night* and in *Markheim*, two short stories of almost faultless technique. Dr. Jekyll, a kindly and handsome physician, transforms himself by means of a secret powder into a dwarfish and malignant Mr. Hyde, whose sole desire seems to be wanton mischief. Gradually the latter type persists, so that larger doses of the drug have to be taken to effect the transformation back into the part of Dr. Jekyll. At last the powder fails to work and Hyde no longer can become the kindly doctor. In despair and cynicism he commits suicide. *Markheim* develops the power of conscience in rousing a man from his ignoble self. The character of Markheim is unstable. He kills a curio dealer of whom he is trying to buy a Christmas present, the motive being robbery, but Markheim is seized by an uncontrollable impulse because of the remarks of the dealer. He finally decides to give himself up to the police. *A Lodging for the Night* is a romantic account of an old French poet named Villon, who is both scholar and vagabond.

Deserted Village, The, by Oliver Goldsmith, 1770, is a delightful nature poem, describing an abandoned village in England. The past is contrasted with the present; the simple life of the old town with the luxury of modern cities. The parson, schoolmaster, children, the broken soldier living over his old campaigns by the fireside, and other simple folk, are described with sympathy and infinite charm. Many lines have passed into our store of quotations: "One only master grasps the whole domain" (the large landowner), "And passing rich on forty pounds a year," (the vicar), "In all the glaring impotence of dress" (stylish persons), "Well had the boding tremblers learned to trace The day's disasters in his morning face" (the awe of the children before the schoolmaster).

Dogberry, a conceited constable in Shakespeare's *Much Ado about Nothing*, makes peculiar blunders in the use of words, as he directs the watch to beware of prowlers in the streets at night.

Dolly Varden, a handsome and engaging miss, in *Barnaby Rudge*, by Dickens, dresses in the height of fashion. The name is now sometimes applied to a girl who dresses well and assumes a mincing and genteel manner.

Dominie Sampson, a learned private chaplain in the home of Guy Mannering, forgets to come to dinner, uses scraps of Latin most curiously, and often exclaims "prodigious." Though bashful and forgetful, he at times rouses himself to some noble deed, as when he assists Meg Merrilies to thwart the abduction of Henry Bertram. In the stage version of Scott's romance, the Dominie long held the center of interest as a comic foil to Meg Merrilies. See *Guy Mannering*.

Don Juan is a character like Faust, in old legends and literature, who sells himself to the devil to enjoy a life of base pleasures. He is a chief character in Mozart's operatic *Don Giovanni* and in a poem left incomplete by Lord Byron.

Don Quixote, a crack-brained hero of many droll and uncommon adventures, is the hero of a novel by the Spanish author Cervantes. He is shown as a Christian knight, learned and gentle, whose mind in unsettled by the reading of many old romances of chivalry. Seeing that the world is imperfect, he arrays himself in fantastic armor, chooses a raw and ignorant villager to be his squire, and sets forth on noble quests. The novel itself stands high among the great fictions of the world. By turning knight-errantry into ridicule, Cervantes diminished the reading of the tales of chivalry in his age. His great work was published in 1605, with a second part ten years later; and Cervantes died in the same month (some have thought on the same day), April, 1616, as Shakespeare.

Dry-as Dust, a learned clergyman, is a fictitious personage who was said to have been the editor of some of the Waverley novels. Not caring to attach his name to his romances, Scott adopted various expedients of attracting attention through Dry-as Dust, and later through a mysterious Jedediah Cleishbotham, another minister, the reputed author of some of the following novels. Until Scott made public acknowledgment at a dinner after the failure of his firm in 1827, not more than twenty-five people knew positively that he was the author of the novels, though it was a common conjecture. Dry-as Dust is now the name often applied to a pedantic critic, commentator, or author.

Duessa, a clever witch in Spenser's *Faerie Queen*, calls herself Fidessa, or the Faithful. She entices the Red Cross Knight into the lair of Orgoglio, a hideous giant. Duessa and Orgoglio live together in considerable splendor, while she dresses in gold and purple clothing, wears a crown, and rides on a monster having seven heads. When she is stripped at last of her false raiment, she becomes once more a hideous old hag and imposter. In a political sense, Duessa is allegorical for Mary Queen of Scots.

Dunciad, The, by Alexander Pope, is a mock heroic poem in form of an Iliad of the Dunces. The author vents his spite on the poor poetasters, who presumed to complete with him for laurels in the age of Queen Anne and later. In an early edition of *The Dunciad*, Bishop Theobald was made the monarch of all dunces, but subsequently Colley Cibber, a dramatist, was given this doubtful honor. Theobald had made some clever emendations of the text of Shakespeare in an edition that rivaled Pope's. The second book shows the nature of the whole. Certain booksellers engage in a race for a phantom poet. Then follows a contest in tickling and braying, until all the actors jump into the mud of Fleet Ditch. For punishment all of them have to listen to the reading of works by two voluminous authors, who put hearers into a profound sleep at last. Next, in his sleep the king is shown the entire history of Dullness in the fields of the shades. In the last book the goddess of the dull establishes her reign over Britain, to the end that all arts and sciences are blotted out; finally, she utters a mighty yawn, and all the earth reels back into chaos and night.

Dundreary is a lord that first attracted wide attention in a play by Tom Taylor called *Our American Cousin*. He is presented as a very aristocratic and genteel blunderer in speech and action. The part, created by the elder Sothern, more recently was revived by his son.

East Lynn, a sentimental romance by Mrs. Henry Wood, reached a wide vogue in both novel and stage versions after it was first published in 1861. In spite of obvious improbability, the plot is handled with skill and vitality. After Lady Isabel Vane is orphaned by the early death of her father, who was obliged to sell his estate of East Lynn, she is wooed by two suitors, one noble and the other a profligate. After her marriage to the more desirable lover, she is persuaded to elope, only to learn soon that she has been deceived by the base rival. Several years later, she returns to her old home as a nurse to her children. When her husband learns of her identity, he offers to forgive her. In the meantime, however, he has married, thinking his first wife dead. Unable to stand the shock of the tragedy, the innocent and wronged lady dies.

Elaine, who is called by Tennyson the lily maid of Astolat, dies of a broken heart after being deserted by Lancelot, bravest knight of all the Round Table. At her request she is placed in a beautiful barge, which is rowed down the stream to the city where Lancelot then is living. In one hand she holds a letter for him, in the other a lily; and in death she is so beautiful that even the heart of the faithless lover is touched with pity.

El Dorado was a fabled land in South America between the great rivers, where gold was so plentiful that the streets were paved with it, and precious gems were used as playthings. Several expeditions from England, including one by Raleigh, tried to find this region among the Indian tribes. As late as 1700 the average person believed in the reality of this paradise. The word is now a symbol of a land where plenty abounds. See Kingsley's *Westward Ho*.

Elegy Written in a Country Churchyard, as finally perfected by Thomas Gray, is the most famous elegiac poem in modern English. Few lyrics have so caught the sentiment and interest of all men. Like Goldsmith's *Deserted Village*, it glorifies the simple annals of the poor and humble peasants who live, love, and then pass into complete oblivion. Gray emphasizes also the common destiny of mankind; for even "the paths of glory lead but to the grave." Yet those whose resting place is not even marked by a simple slab or headstone have not lived in vain; they, too, are immortal in the progress of the world.

Elia is a name borrowed by Charles Lamb from a clerk in the India House, where Lamb for years was a clerk. The *Essays of Elia*, in two different collections dating from 1823 and 1833, embody the humor, kindliness, and whimsical thoughts of the most loved English essayist.

Lamb is most delightful when most discursive, and most human when he speaks of the love of children which a bachelor has missed and which he imagines in the tender sketch called *Dream Children*. For variety of subjects, Lamb offers us "Mrs. Battle's Opinions on Whist," "The Praise of Chimney Sweeps," "Witches," "Old China," "Poor Relations," and the account of how the flesh of animals came to be roasted in his *Dissertation on Roast Pig*, an elaborate, fantastic narrative.

Elsie Venner introduces minute analyses of life in a New England village, combined with many acute and witty observations, and the captivating love story of a young girl. This novel by Oliver Wendell Holmes shows how Elsie, a very odd girl, became the puzzle of the town and the despair of her father, a widower. She appears to be a mysterious combination of noble girlhood and subtle, serpent cunning. Only by a powerful love does Elsie awake to her best self.

English Humorists of the Eighteenth Century is a series of criticisms by W. M. Thackeray, delivered first as lectures and then published in 1853. The different parts reveal the temper of the age of Queen Anne as few similar works do, in their witty characterization of men like Swift, Addison, and Pope. Thackeray most admired the novelist Fielding, his literary model, as he admits in his vivid sketch of this English dramatist, novelist, and judge.

English Literary Reviews date from the age of Addison, but few attained wide fame before the founding of the *Quarterly* in 1800, the *Edinburgh* in 1802, *Blackwood's* in 1816, and the *London's Magazine* in 1817. The *Edinburgh* was as strongly Whig as the *Quarterly* was Tory in its politics. Critics unfortunately paid more attention to the party a man belonged to, to his education, and to his companions than to his actual merits as a poet. They judged according to rules of the past age, and therefore could never appreciate romantic authors like Wordsworth and Coleridge, though eventually they gave some others like Byron their due, especially after Byron had replied caustically in his brilliant poem, *English Bards and Scotch Reviewers*. Notable among the attacks by the critics was the scathing indictment of Wordsworth in a review beginning, "This will never do; the case of Mr. Wordsworth is now manifestly hopeless." Some of the writers advised Keats, who had studied surgery and medicine, to "go back to his pills and plasters." One article spoke of the Cockney School of Poetry, of which Leigh Hunt was pictured as the "hierophant" and leader. In derision they called Coleridge, Southey, and Wordsworth "Lakers," since they lived in the midst of the English lakes and wrote of them in their poems. Not until Lamb, De Quincey, Walter Scott, and Macaulay contributed many real critical articles did the reviews take on urbanity and tolerance. Yet the reviews, by paying authors for their articles, established a real school of literary criticism, for which the best could afford to write.

Enoch Arden is a narrative poem of domestic life by Tennyson. It is a real idyl in its simple treatment of a romantic story. Returning after an absence of several years, caused by a shipwreck, a seafaring man finds his wife happily married to another. She has thought him dead. Enoch withdraws and lives unknown in the town till the time of his death.

Eppie, child in *Silas Marner*, which title please see.

Essay on Man and **Essay on Criticism** are two verse discussions by Alexander Pope. The first gives an account of the nature of man, his relation to his fellows and to God, how happiness may be attained by not inquiring too deeply into the secrets of nature, and how everything is ordained for the best. "Whatever is, is right" is the prevailing sentiment. The *Essay on Criticism* suggests both a theory of forms and a few simple rules for judging. Pope tells us it is as great a fault to judge ill as to write ill; nature is the best guide to the formation of correct taste; the ancients should be our models; pride, partiality, and prejudice hinder true criticism, and the good critic must have candor, truth, modesty, and good breeding. Pope also discusses the varieties of metrical effect and satirizes conventional diction, always holding Aristotle up as a pattern to imitate.

Euphuism is the name for a fantastic kind of writing developed to a high degree in a romantic narrative by John Lyly in the age of Shakespeare. The hero discusses various questions of etiquet. Courtship is one of the favorite topics, with such questions as, Does the man or the lady fall in love first? This book was found in every fashionable home for many years after its publication in 1580. The style is fantastic, being a combination of balanced parts, in which other groups balance, in both sound and arrangement of words. Sidney's *Arcadia* is somewhat euphuistic, and some of Shakespeare's plays, like *Much Ado*, have the witty contrasts, puns, and other devices in a large degree.

Evangeline is Longfellow's graceful and pathetic narrative of the expulsion of the French from Nova Scotia by the English. The heroine wanders over a good part of the United States in search of Gabriel, the young man to whom she was betrothed. They meet at last, when Gabriel is brought to the hospital where Evangeline is a nurse. Just after recognition, he quietly passes away with a smile on his lips.

Evelina is a wonderfully realistic account of the introduction of a young lady into the society of England in the second half of the eighteenth century. The author, Frances Burney, succeeded in reproducing the little foibles, gentility, and conventionality of the age. Evelina is constantly humiliated by her vulgar relatives, who almost prevent Lord Orville from making a proposal of marriage. Her grandmother, Madame Duvall, somewhat frenchified, is held up to ridicule for her vanity and presumption. Many chapters are delightfully humorous. Like many of the fictions of the time, this novel is in letter form.

Everyman, an old morality play of unknown authorship and date, tells of the journey of every person from this world to the next. It is replete in subtle characterization, dignity of treatment,—though mixed at times with humor,—and underlying moral, not too strongly emphasized. All the friends and companions of Everyman, on learning that they cannot return from the long journey, refuse to accompany him. Only Good Deeds remains till the last breath, though Conscience and Religion approach very near the gates of death.

Faerie Queen, The. This elaborate allegorical poem by Edmund Spenser is one of many glorious literary monuments of the age of Elizabeth. It is impossible here to outline the many stories of the different parts. These narratives come from all ancient and modern sources known to the poet. The author originally planned twelve books, fashioned according to the moral virtues as named by Aristotle. Yet only six books, with two or three fragments, were completed, the first three in 1590, the remainder in 1595-6; but they contain thirty-six thousand lines. Each book has its pattern hero, who engages in various adventures in which many others join. The Red Cross Knight typifies Holiness; Sir Guyon, Temperance; Sir Calidore, Courtesy, for instance. Glorianna and Mercilla, two chief characters, are intended as graceful compliments to Queen Elizabeth, who is characteristically flattered. The initial plan was to marshall all the characters at the court in the last book, but the magnitude of the story was too large. Prince Arthur, appearing at some time in all six books, is the pattern of perfection. Some of the many great stories of the *Faerie Queen* are those of Una and the milk white lion; Britomart and her imprisonment in the enchanted castle; Acrasia and her vile Bower of Bliss; Artegal, who represents justice, and his iron flail; and the various devices and impostures of the false Duessa. Though few persons finish reading all of this epic, one may find interesting stories in every canto.

Falk is a sea captain in a story by Joseph Conrad of the same title. No more vivid picture of a man exists in the writings of this gifted Polish gentleman and sea captain, who adopted English as his literary language.

Fall of the House of Usher, The. Edgar Allan Poe in this short story reaches the summum bonum in temperamental and impressionistic narrative. The entire atmosphere is gloomy, mysterious, and supernatural. Roderick Usher, a melancholy nervous patient, summons his friend, if the latter would see him once more alive. Both in look and in action Usher has greatly changed. His sister, even now, is wasting away of some incurable malady. At last she is entombed in the depths of the castle. Some days later, while Roderick and his companion have reached a particularly imaginative passage in a book of magic, they hear noises in the cellar, and then suddenly the Lady Madeline bursts open the door, falling prostrate within the room. Roderick, now wrought to highest tension, staggers and falls, never to rise again. The friend escapes, but sees a great fissure in the side of the house gradually enlarge till the castle itself is tumbled in ruins. Poe throws in some hints to make us understand that the story is prompted by the neurotic imagination of Usher.

Faust is the great drama by the German poet, Goethe. According to a favorite story in the Middle Ages, a student sold himself to the Devil on condition that

he be allowed a certain time for any pleasure he might choose. At the end of the compact, the young man is carried away by Satan or one of his messengers. Marlowe, a dramatist of Shakespeare's time, used the same story in his *Dr. Faustus,* which rises to a high pitch of imaginative and poetic grandeur. Several later operas have used parts of the Faust legend.

Flying Dutchman is the subject of numerous tales in German and other modern languages. In one version a man is condemned to sail forever around Cape Horn without finding any safe harbor. Sailors claimed that it was an exceedingly bad omen to come in sight of the Flying Dutchman and his phantom ship. Scott once said that the ship originally was laden with bullion, and a plague broke out aboard as a punishment for a murder by one of the crew. Coleridge modified the idea to include punishment by drought and suffering for killing an albatros. Wagner based an opera on the legend.

Fortunatus, according to various folk tales since 1500, came into possession of a wishing-cap and purse that never became empty. Some version has appeared in many stories and dramas, notably in a romantic play by Thomas Dekker, a shoemaker and author of Shakespeare's age.

Forty Thieves. See *Ali Baba and the Forty Thieves.*

Frankenstein, a novel by the wife of the poet Shelley, tells the terrible mistake of a young medical student who created a sort of man monster out of fragments from the graveyard and dissecting room. By means of galvanism, he succeeded in endowing the creature with life, but eventually Frankenstein himself suffered. The monster at last became disgusted with its own deformity and wrought a terrible revenge on the student.

Gallegher, one of the best stories of atmosphere of the newspaper, tells how the young office "devil," hearing of a prize-fight, outwitted both his competitors and the police and brought back the story to make a "scoop" in a special edition. The author, Richard Harding Davis, a news correspondent, also wrote the Van Bibber stories of New York club life.

Gettysburg Address by Abraham Lincoln is a model of clear and effective English prose. Though it was written with deliberation, and not in haste as some have asserted, the few lines show the power of our great President in simple, homely diction. Edward Everett delivered a long and studied oration on the same day, but told Lincoln afterward that these few words would be remembered long after his own elaborate effort was forgotten. This prophecy has been fulfilled.

Gesta Romanorum (Deeds of the Romans) is a collection of many tales, dating from 1200 or shortly afterward. It includes stories besides those of classical times. Gower and Chaucer borrowed some of their plots from this work; and Shakespeare apparently drew some of the story of *King Lear* from it. It has indeed been a perennial store of plots for many authors.

Gold Bug, The. This is one of Poe's detective stories. Two men, sitting by a grate in a hut on Sullivan's Island, off Charleston, South Carolina, discover a mysterious writing on a parchment. One man makes a cipher which gives him the key to the meaning. By interpreting the parchment, he learns of a treasure buried by Capt. Kidd or some other pirate. A negro furnishes some grotesque humor in the story. Much of the narrative shows how the cipher was interpreted.

Golden Treasury of Songs and Lyrics, by F. T. Palgrave, is a celebrated collection of short poems in English from Shakespeare to Tennyson. Though now somewhat out-of-date, it still contains about the best collection of poetry of the last three centuries.

Grace Abounding, the autobiographic narrative by John Bunyan, tells much of the inner soul experiences of the great English preacher. Bunyan gives an account of his early years, his conversation, and spiritual history while he was confined in Bedford gaol, for preaching without a license. Forged red-hot out of a volcanic soul, this narrative abounds in picturesque words, as expressive as they are homely. It is a human document in the history of religious toleration.

Gradgrind, a man in Dickens' *Hard Times,* has become a name for a hard-fisted, practical man of affairs. In the novel he is always calling for "facts," which he treats as his pawns. He also fits people into his mechanical way of thinking. The rest of the Gradgrind family have their own peculiarities and humours.

Grail, The Holy, was always mentioned as the mysterious chalice out of which Christ drank at the Last Supper. According to legend, it was brought to England by Joseph of Arimathea. Through the spiritual fault of its keepers, the Grail suddenly disappeared and then became the quest of all knights of the Round Table. Only a man of perfect nobility and purity could see it. Tennyson tells the story in one of the *Idylls of the King.*

Grandison, Sir Charles, is a novel with a faultless hero in a trilogy of romances written by Samuel Richardson. He rescues a noble lady named Byron from the machinations of false suitors, yet he can not marry her because of an engagement with another. The second lady at last withdraws on account of religious and other differences, leaving the perfect knight to marry the lady he loves. Grandison has a high sense of honor, which is sometimes rather far-fetched.

Griselda is the type of patient wife in the literature of the Middle Ages. The story is told by Chaucer, who took it from Boccaccio or some other old Italian romancer. A prince, wishing to test the faithfulness of his wife, forces her to do all sorts of menial tasks, takes her children from her, treats her as a servant, and finally supplants her in the home by another woman. Griselda bears all this with angelic resolution and patience, until she wins the respect and full confidence of her husband. Doubtless this story is allegorical, and it may come from early ages. Griselda in old literature is often cited to wives for them to imitate.

Grundy, Mrs. One of the ladies in Morton's *Speed the Plow* frequently alludes to a certain Mrs. Grundy, whose opinions and conduct are worthy of attention. "What will Mrs. Grundy say?" is the common question, but the lady alluded to never appears in the open. The name is now used for public opinion, or the old lady who censures the conduct of all her neighbors, the personification of a critic of manners.

Grub Street in London, now called Milton Street, was once the resort of poor authors who wrote for their daily bread. Those who were not so dependent on their earnings looked down upon them. The phrase was used by Dr. Johnson of a hack author who turns out a certain amount of copy at a certain price, dependent on what the publisher will give him. Pope, Swift, and other satirists constantly allude to Grub Street men.

Gulliver's Travels, a powerful narrative satire by Jonathan Swift, violently ridicules "the beast called man." Capt. Gulliver, a retired ship surgeon, makes four remarkable voyages. First, he is shipwrecked on the coast of the Lilliputians, a race of dwarfs hardly visible to man. Here he learns of their social customs, their controversies, and their warfare with neighbors. Next, he lands on the shores of Brobingnag, where men are sixty feet in height, and Gulliver seems utterly contemptible to them. On the third voyage, among fantastic places, he visits the floating island of cement, on which the philosophers wander about in a maze, thinking of impossible schemes like extracting sunlight from cucumbers. On his last voyage he finds himself in the land of the Houyhnhnms, a race of intelligent horses, much more capable than men on earth. They indulgently tolerate Gulliver as a rather fine specimen of a debased class of beings. Few books are more powerful in satire, more bitter because of the faults of humanity, or more the evidence of genuine creative genius, even though distorted.

Guy Mannering, second of the novels by Walter Scott, 1815, contains the romantic story of the abduction and recovery of Henry Bertram, last heir of the house of Ellangowan. Much of the interest of the novel derives from the faithful Meg Merrilies, an old gypsy, who thwarts the plots of smugglers and a rascally lawyer to put Henry Bertram to death. The story of two sets of lovers is not remarkable for interest or originality. Meg, though half crazed, moves about as the nemesis of the action. Daniel Terry, friend of Scott, with some assistance from the novelist himself, composed a drama in which Charlotte Cushman, the great American actress, won considerable fame in England, Scotland, and the United States. Dominie Sampson, a kindly but abstracted tutor, furnished much of the comic interest of the novel and play.

Hakim, the Soldan in disguise, is one chief character of Scott's novel, *The Talisman,* described elsewhere.

Hamlet, the most thoughtful tragedy and longest play by Shakespeare, is a story of the intellect, the soul, and the instincts of man. Hamlet learns from his father's spirit that Claudius, now his step father, instigated the

murder of the elder Hamlet. He devises a symbolical masque to touch the conscience of the guilty king and queen as played by a group of strolling actors. Hamlet kills a wise old courtier, who is eavesdropping, by a thrust of his rapier through the arras around the wall; he breaks off his engagement to Ophelia, a daughter, who drowns herself; and is at last sent to England by Claudius on a dangerous mission in charge of pirates who are instructed to make way with him on the voyage. He cleverly changes their written instructions, and escapes when the ship is attacked by pirates, who conduct him back to Denmark. There he is fatally wounded by a poisoned rapier in the hands of Laertes, the brother of Ophelia. Previously he has stabbed the king, after having forced Claudius to drink of a poisoned cup. Hamlet's soliloquies, hesitation, and general traits of character have given rise to much speculation, especially in regard to his sanity, which modern scholars do not doubt, since they believe he was feigning madness to effect his plans more surely.

Heart of Midlothian, The, a novel by Walter Scott, published in 1818, preserves for all time the heroism of a simple Scotch lassie, who would not lie to save even a sister from the gallows. Jeanie Deans, the heroine, however, walks all the way to London to secure a pardon from Queen Caroline. This romance has fewer characters than most novels by Scott, fewer passages of description, and yet the country of the Midlothian district, the Tolbooth or old jail in Edinburgh, and the scenes of Jeanie's trip to London are quite memorable. Madge Wildfire, a sybil type of crazed woman, helps the plot by rescuing Jeanie from impending harm, but she complicates it in other ways. Effie Deans, accused of murdering her child, at last is proved innocent, since it is shown that Madge stole the child away.

Henry Esmond by Thackeray takes us back to the age of Queen Anne, a period which is reproduced with historical fidelity. Henry is the real heir to the Castlewood estates, but he is brought up by a second cousin, the possessor, whose beautiful wife is eight years older than Esmond. When Lord Castlewood is slain in a duel, Henry learns that the property belongs to him by right, though he refuses to claim it or to make his secret known. On returning from the wars on a furlough, he falls in love with Beatrix Esmond and woes her for ten years, while she holds him in reserve in case she fails to make a larger conquest. Beatrix is involved in a friendship with the young Pretender, whom Henry and others seek to place on the throne when the Queen dies; but the Prince spoils all the plans by running off to see Beatrix at the critical moment, and so is not available when Anne breathes her last. Despite the seeming differences of age and training, Henry feels that he cares for Lady Castlewood, who consents to marry him. Leaving a son of his wife in charge of the estate, Esmond and his wife emigrate to Virginia. In a sequel, *The Virginians*, some of the further history of their descendants in the time of Washington is chronicled. Society and romance in Virginia are pictured with great vividness. One of Esmond's grandsons finally rescues the other from the baneful influence of the old Baroness Bernstein, an antiquated beauty who is none other than Beatrix, now grown fat and despicable in every way.

Heroes and Hero-Worship, a work by Thomas Carlyle, shows the place of great leaders in history. Every age, says the author, produces its eminent men, but some ages do not discover them at once. The hero as prophet is exemplified by Mahomet, the founder of Islam; as divinity by the Norse heroes; as poet by Dante and Shakespeare, each standing for different qualities and ages; as man of letters by Johnson, Rousseau, and Burns; as king by Cromwell and Napoleon, in quite opposite charac teristics.

Hero and Leander, two tragic lovers, are much lamented in old song and story. Leander lived opposite to the shrine of Hero on the shore of the Hellespont, which he was in the habit of swimming to visit his beloved. One night he was seized by a cramp and sank to his death; and Hero desperately cast herself into the sea. Marlowe, the great Elizabethan poet and playwright, began a picturesque poem describing the two lovers, and it was completed after his early death by George Chapman.

Hiawatha, a poem by Longfellow, in imitation of the old Greek six-foot meter, embodies some of the primitive legends of the great chieftain, who is spoken of as the father of his people, the Six Nations or Iroquois. According to legend, Hiawatha departed to the land of the Hereafter when the white settlers arrived.

Highland Mary was a girl celebrated by Burns in several of his tenderest poems. Though still a subject of dispute, she is commonly believed to have been a young servant girl, to whom Burns pledged his faith as a lover, but who died before their marriage.

Hohenlinden, a martial lyric by Thomas Campbell, memorializes a battle near Munich in which some French defeated an Austrian army. The name, meaning "high linden trees," is the name of a village. Campbell also wrote many patriotic lyrics, two of which now well remembered are "Ye Mariners of England," and "The Battle of the Baltic."

Hoosier Schoolmaster, The, is an amusing narrative of primitive days in the state of Indiana. Ralph Hartsook, the village teacher, proves that he can handle a school in spite of opposition of boys older and larger than himself. Some of the memorable chapters include the story of the spelling bee, the visit of the "Hardshell" preacher to the schoolmaster, and the wooing of a fine-spirited girl whom Ralph finally makes his wife. This is one of our best early local color novels.

Horatio, the friend of Hamlet, is spoken of as a philosopher and gentle spirit.

House of Seven Gables, The, one of four long romances by Hawthorne, shows four cousins and others in a stern but romantic New England atmosphere at Salem. Old Judge Pyncheon, a wily and avaricious politician, is trying to commit his cousin, Clifford, to an asylum, after having been instrumental in keeping him in prison for years. Hephzibah, a sister of Clifford, lives in poverty and constant fear. To eke out her scanty living, she has set up a cent-shop, which is the resort of the children of the neighborhood. Phœbe, another cousin, lives in the house of seven gables, where there is also a lodger, who loves Phoebe and afterward tells the story, as recorded in the novel. The schemes of the judge are thwarted one day as a stroke of apoplexy cuts him off while he sits in Hephzibah's parlor, waiting for her to bring in Clifford for an interview. Then follows a wonderful chapter of apostrophe by Hawthorne, one of the finest in all our language. In the background of the entire narrative is the idea of an hereditary curse which has blighted the Pyncheon family for generations.

Huckleberry Finn, narrates the story of Tom Sawyer and his friend, as they journey down the Mississippi on an improvised raft. They are accompanied by an interesting negro, Jim, who assists them to weather many an adventure that might have swamped them. In this story, as in *Tom Sawyer*, Mark Twain shows that he well understands the country of the Mississippi basin.

Hudibras is a mock-heroic satire lampooning the Puritans in England in the second half of the seventeenth century. This work by Bishop Samuel Butler adopts the machinery and some of the incidents of Cervantes' *Don Quixote*, applying them to a Presbyterian and his squire, who fall into many absurd and peculiar adventures. All of these are described with dash, abandon of language and metrical form, and scathing wit, full of venom.

Iago, a villain in Shakespeare's **Othello**, is scarcely less than satanic in all his thoughts and actions. He preys on the credulity of Othello until he makes him believe that both his wife and his faithful lieutenant, Cassio, are untrue to him. By clever argument and insinuation, he works Othello up to such a pitch of insane fury that the Moor strangles Desdamona, his noble wife, without giving her any chance to prove the charges unfounded. In many of the gothic romances of the late eighteenth and early nineteenth centuries, Iago became the pattern for cruel and devilish tyrants.

Idylls of the King, thirteen narrative poems by Tennyson, form a group of stories of King Arthur and the knights of his Round Table. They date from 1859 and were completed in 1885. Many of the characters typify human beings, with their faults, virtues, and whims. Tennyson drew a large part of his material from the old prose romantic account by Malory called *Morte d'Arthur*, but he invested the entire number with a modern atmosphere and interpretation, quite foreign to the old chroniclers. Arthur is a noble, but cold monarch, who somewhat neglects his Queen and the sentiments of life. Guinevere, therefore, turns to Lancelot for sympathy, and they at last elope and disrupt the Round Table. Others make war on Arthur while the whole court falls into bloodshed and ruin. Percival and Galahad are described as perfect knights, but the latter only sees the Holy Grail, which is also beheld by Percival's sister. At the end Arthur is mortally wounded and asks to be returned to the sea from which he originally came. The last idyll describes how he is attended by Bedivere, a single faithful knight, who witnesses the coming of a barge with three white

ladies that receive the king for his last voyage. Every idyll of the entire group contains many nobly musical and imaginative lines. Some of the best versification of the nineteenth century is found in *The Passing of Arthur.*

Iliad, The, a Greek poem dating from about eight hundred years before the present era, contains many episodes taken from different sources and seemingly woven into a complete epic. It has been credited to Homer, a blind bard, who may have collected and polished existing material. Apart from some irrelevant details, the story describes the siege of Troy by the Greek armies, after the abduction of Helen from Greece by one of the sons of Priam of Troy. After three introductory books, describing the preparations for war, the coming of the invaders and some skirmishing, Paris and Menelaus, the husband of Helen, engage in a combat. The Trojan is wounded, but is carried off safely by Venus. Then the Trojans refuse to fulfil their compact to return the stolen wife if their champion should fall in the fight. In a succeeding attack on the city of Troy, the gods range themselves on one side or the other, with terrible slaughter as a result. Achilles, who at first sulked in his tent, now kills Hector, and old Priam comes to the Greeks to claim the body of his son. The entire epic concludes with an episode of the funeral rites over the slain hero. Vergil's poem, *The Aeneid,* takes up the narrative where the Greek epic ends.

Il Penseroso, a poem by Milton. See *L'Allegro.*

Inland Voyage describes a journey by Robert Louis Stevenson down the canals and rivers of France and Belgium to the sea. The different chapters abound in vivid accounts of the natives, odd adventures, and humorous comments. Even the trivial takes on a wealth of color and romantic charm. *Travels with a Donkey,* a companion narrative, outlines a trip made by Stevenson in the Cevennes in Spain.

In Memoriam, a series of one hundred thirty-one poems, reflects the scientific and religious trend of the nineteenth century as represented in the thought of the author, Tennyson. These lyrics were written in memory of Arthur Henry Hallam, son of the historian, who died while he was still a young man. For about fifteen years Tennyson dedicated many short meditative poems to this group, which is notable for sincere thought, beautiful nature descriptions, lines of musical charm, and a gradual development of thought from doubt to robust Christian faith. The series might almost be called an epitome of the religious questionings of the age.

Ivanhoe, one of the most popular of the novels by Scott, records the adventures of many characters. The chief group includes Wilfred of Ivanhoe, Rebecca and her father, (two Jews), Brian de Bois Guilbert and other knights of the cross, Richard the Lion Heart, just fresh from a crusade in Palestine, Robin Hood and his men, with a group in the home of Cedric, father of Ivanhoe, including Rowena, whom the hero at last marries. Many stirring events make up the different parts. Some of these are the coming of the Templar, the Unknown Knight, and others to the home of Cedric, to which also Isaac and Rebecca resort for protection; various humorous scenes in which Gurth and Wamba, domestics, play jokes and debate; the imprisonment of Rebecca and Isaac, and a most dramatic scene in which some black servants of their captors demand ransom in gold of Isaac; and the noble resistance of Rebecca when she is pursued by the unworthy Templar and forced to the edge of the parapet at Torquilstone Castle, before he would withdraw and leave her in peace. All rises to a climax when Rebecca, condemned as a sorceress, pleads for a champion, and Ivanhoe rides into the lists to engage and overcome Brian de Bois Guilbert. Robin Hood and his tuneful companions in the forest contribute some interesting melodies. As a picture of life in the early days, about 1200, this novel has been highly appreciated. Scott failed somewhat in making the marriage of Rowena, a palish damsel, and Ivanhoe seem reasonable, but he always stated that the times of the novel never would have permitted a Christian like the hero and a Jewess like Rebecca to marry, and, further, that poetic justice does not demand that all noble characters in fiction should be amply rewarded with some positive favor.

Jaques, the contemplative man in *As You Like It,* which please see.

Jane Eyre, one of our best autobiographic novels, written by Charlotte Bronte, one of three gifted sisters. The story reveals the terrible loneliness of an orphan girl in the midst of unsympathetic and even cruel relatives, her life in a charity school, where she suffered somewhat but enjoyed the companionship of other girls, and of her service as a governess in the home of an eccentric man, whom she afterwards marries. Most of the incidents seem as real as if the author herself actually lived in them. Mr. Rochester, the employer, has a wife living, but fails to notify Jane, though he considers himself morally freed, since the wife is a helpless maniac. Others arrive to separate Jane and Rochester at the altar; and then Jane escapes to resume her life as a school teacher. While she is absent, Mr. Rochester is stricken blind when he tries to rescue his wife as their estate is burning. His misfortune leaves him a chastened man, kindly disposed and wishing forgiveness for trying to deceive the one he loved best. Jane returns to him, and they continue to live at Mr. Rochester's smaller country estate.

Jarley, Mrs. is the proprietor of the traveling "wax works" as described in Dickens' novel *The Old Curiosity Shop.* The name is now used for tableaux in general as a form of entertainment.

Jarvie, Bailie Nicol, a droll, clannish, and opinionated Scotsman, is a companion and distant relative of Rob Roy in the novel by Scott. Scott himself warmly praised the stage character, as impersonated by Charles Mackay, which he said was realism itself.

Jerusalem Delivered, a great epic in twenty books, is the work of Torquato Tasso, an Italian poet of the sixteenth century. It relates the tale of the capture of Jerusalem by some of the late crusaders under Godfrey. One of the romantic elements is the love of Rinaldo, the great Christian champion, for Arminda, a lady sent from Damascus to beguile him. Godfrey at last persuades him to return to the conquest, and victory is then assured. Afterward he wins the love of Arminda, though in the meanwhile she has sought to cause his death by poison. With other romantic adventures, including two or three additional love stories, the poem concludes with a magnificent picture of the entry of the victorious hosts into the Holy City.

John Halifax, Gentleman, as written by Dinah M. Craik, is the story of the rise to fortune and fame of "one of nature's noblemen," as the title character has frequently been named. Becoming an orphan at eleven, John Halifax works for three years in the country, then engages himself to a Mr. Fletcher, who owns a tannery. His employer's invalid son, taking a fancy to him, teaches him and assists him to further his education. Ursula March is the chief feminine character. The main interest of the novel lies in its faithful portrait of true nobility, irrespective of success, wealth, or social status.

Julius Caesar, like other Roman plays by Shakespeare, came mostly from *Plutarch's Lives,* a work describing many old Latins. The dramatic events arise out of the death of Cæsar and the subsequent effect on the people of Rome. Mark Anthony, friend of the slain general, incites the populace to declare war on Brutus, who has aided in the conspiracy against Cæsar for patriotic reasons. Though departing from the story in some questionable details, the great dramatist has written a wonderful account of the effects of ambition on the heart and soul of Roman men. This play contains many noble lines of declamation,—such as the passages in which the superstitions of the mob are described; Anthony's oration over the dead Cæsar; the quarrel between Brutus and Cassius at Philippi; and the speech of the tribune Marcullus. Other interesting passages show the tenderness and fidelity of Portia, wife of Brutus, with her lamentable death; the scene in the last act at midnight, with the little page waiting before the tent of Brutus, when the general is troubled with visions and waking dreams; and the self-destruction of both Brutus and Cassius. In dramatic construction the play has obvious faults, but in characterization and force of action, it is one of Shakespeare's noblest.

Junius was the name signed to a series of polemical letters contributed to the *London Daily Advertiser* from late in 1768 to early in 1772. Apparently written by a lawyer, they show an intimate knowledge of men, politics, and social conditions of England in the time. Not a few speak in flaming terms against ministers of the Crown and even against the King himself at times. The anonymous author champions the cause of democracy and the good of the state as a whole, as opposed to the rule and interest of the few. He lays down this as one of his first theorems: "The admission of a free people to the executive authority of government is no more than compliance with laws which they themselves have enacted." These remarkable documents created a tremendous furor in the time, and even now they have a certain sting. At least thirty-five authors have variously been named as the writers of the series, which may not all have come from a single hand. Edmund Burke, Lord Temple, and Dr.

Butler had their proponents. Sir Philip Francis was even then suggested as the probable author, and his grandson afterward offered certain conjectural proofs to support the view, but the subject is not yet wholly cleared of doubt. Macaulay said that enough evidence had been presented to convince any reasonable judge in a court that Francis was the author.

Kenilworth, thirteenth in order of publication in the Waverley novels by Sir Walter Scott, gives a clear picture of life in the age of Elizabeth. Like some other romances by Scott, this story introduces both historical and fictitious characters. The many events, as concerning Amy Robsart, have been taken out of their true setting and presented in a light not favored by historical research. The secret marriage of the Earl of Leicester with a daughter of Sir Hugh Robsart forms the central motive. Richard Varney, the villain, who resembles Iago in Shakespeare's *Othello,* is always seeking to persuade Leicester to allow him to claim Amy as his wife. He thus hopes to marry the Earl to the Queen, and to have Amy indeed for himself. Leicester prepares an opening for the tragedy when he delays acknowledging at court that Amy and he are truly man and wife. When the revelation comes, under most dramatic circumstances, in presence of the Queen herself, the monarch issues certain commands, and Leicester orders Amy put to death, thinking she is faithless to him. Though the Earl sends a quick countermand of his first wishes, Varney has seen that the death took place before the second message could reach Cumnor Hall, where Amy had been a virtual prisoner, and to which place she returned at once after her interview with Elizabeth. Apart from the narrative itself, the novel shows some of the customs, inns, statesmen, poets, and royal interests of Elizabeth as both woman and queen. Especially vivid and historical is the description of the visit of Queen Elizabeth to the castle of Leicester at Kenilworth.

Kidnapped, a romance of adventure by Robert Louis Stevenson, presents some scenes hardly equalled for tenseness in average books of fiction. It was first issued in 1886. David Balfour, a sturdy lad in Scotland, finds his uncle and guardian a miser and villain. David is finally shipped on board a vessel bound for America, where his uncle has planned to sell him into service. David, on the journey, falls into a friendship with Alan Stewart and other Highland Jacobites, with whom he joins in many hair-raising escapades. Eventually he returns to Scotland and foils his rascally uncle in his plan of stealing the lad's estate. Several fights in the story are memorable for dash and heroism.

Kubla Khan, a fragmentary poem by Coleridge, sets out to describe in detail the appearance and history of a "pleasure dome" erected by an Eastern potentate. The author said that the introduction to this came as a dream to him, and he was unable to complete the narrative in his waking moments. For rich musical effects, showing the power of sound to suggest vagueness and luxury, this gorgeous fragment has few compeers.

Lady of the Lake is a character in various old stories. In the metrical romance by Walter Scott, she is Ellen Douglas, daughter of an outlawed noble living on an island in Lake Katrine. An unknown huntsman, who calls himself Fitz-James, appears at the shore just as the Lady of the Lake is emerging from her boat. Old Douglas kindly receives him and assists him to continue his journey. A bold Highland chieftain, named Roderick Dhu, is chosen to lead the wanderer into the unfrequented paths of the north. The poem describes the entrancing beauty of the Highlands, the gathering of the clans for warfare, and the conflict between Fitz-James and Roderick Dhu, who is jealous of him and seeks to vanquish him in personal combat. At the end of many stirring events, Fitz-James is recognized as the King in disguise, who gives the Lady of the Lake to Malcolm Graeme and also pardons Douglas and his clan. To read this poem is almost like a visit to the old Highlands of Scotland in the days of chivalry.

Lady or the Tiger, The, is a puzzle story or hoax by Frank R. Stockton, an American author of numerous clever narratives. It gives a detailed account of a barbaric princess, in very early ages, whose lover is betrayed to her imperial father, and condemned to face the beasts of the arena. Yet, in a spirit of offering some chance, the emperor decrees that two doors shall be arranged so that out of one a beautiful lady shall come, and a tiger out of the other. In some way, by ingenuity or bribery, the princess learned which compartment sheltered the lady. If the lover should choose one door, he and the lady emerging through it would at once be married. Otherwise, he most certainly would be devoured by a ferocious tiger. The barbaric princess, therefore, nodded to the young man in the arena, giving him a signal as to which door to choose. Nobody but he saw her thus communicate. Now, the question is, which door did the young man choose? Each reader is left to judge for himself.

Lake Poets or "Lakers," as a contemptuous reviewer called Wordsworth, Southey, Coleridge, and their fellows, settled in the lake district of northwestern England to meditate, study nature, and write. In these simple surroundings, they broke away from some of the old traditions and conventionalities of the past age, expressing a love for simple themes, homely words, and sincere emotions.

Lallah Rookh, a somewhat fantastic oriental romance in verse by Thomas Moore, written in 1817, ran through six editions in a single year. When the *Edinburgh Review,* however, pronounced it "a public nuisance," Moore engaged Jeffrey, the writer of the article, to meet him in a duel, but both were arrested after they had arrived and were about to fire blank cartridges from their pistols. This affair led to a lasting friendship between them. The story of the poem is that of an eastern princess, to whom several tales are told, while she is journeying to the home of her husband in another land.

L'Allegro and the companion lyric, Il Penseroso, by Milton show the interests and studies of a man in different moods, or of two separate men. One is serious and meditative; the other is gay and companionable. *L'Allegro* reviews some of the simple pleasures from dawn to midnight. These include the early song of the lark and the clarion of the cock at daybreak, the coming of the farmer and the milkmaid, with a description of meadows, brooks, and trees, dinner in the shade at noon, sports later toward evening, and the studies and recreations of the home. *Il Penseroso,* the meditative and pensive man, begins with evening and concludes with the pleasures of the forenoon. It speaks of the nightingale, "most musical, most melancholy" of singing birds, of the ringing of the curfews, with reading of philosophy, drama, or one of Chaucer's works until the sun comes to "fling his flaring beams" across the world, and a final appreciation of music and the life of a student. The metrical form of these two poems is varied, graceful, and musical to a large degree.

Land of the Leal, in the beautiful poem by Lady Nairne, means the heavenly country. Once it meant any land where happiness, virtue, and valor were supreme, —a kind of no man's land of the poet's dreaming, or a haven of kindly sentiments.

Last Days of Pompeii, as a subject for a novel was suggested to Edward Bulwer, Lord Lytton, by the excavations in the old buried Roman city. The action of the book occurs at the time of the eruption of Vesuvius that overran the country roundabout. Glaucus and Ione, two lovers, are likely to be separated by the girl's guardian, who is a scheming man of base motives. Nydia, the blind flower girl, though also in love with Glaucus, leads the two lovers out of the burning city. Lord Lytton portrays here a beautiful and heroic soul. The romance is permeated with learning, contrasts of character, and fine descriptive scenes. Some of the notable ones that stand out in memory are the gladiatorial combat, the Roman banquet, with other domestic sketches, and the striking and terrible events during the time of the destruction of Pompeii. The novel was written in 1834.

Last of the Mohicans, a Leatherstocking Tale by James Fenimore Cooper, is a prose epic of the American forest in primitive times. Chingatchgook and his son Uncas, last of the tribe, share our admiration for the white hero, Hawkeye; while Magua, a bad redman, justly merits the punishment he gets for his baseness and treachery. Cooper, of course, idealized the Indian, making him at times better, at times worse than he really was. The story narrates the stirring events of a journey in the time of the French and Indian War near Lake Horicon in eastern New York. Constant vigilance against treachery by Indians in ambush, forced marches to the northward, solicitude for the ladies of the party, make up the chief interests.

Leatherstocking Tales, five novels by Cooper, are his tribute to the early pioneers who opened up the country west of the Hudson in New York. This series includes *The Deerslayer, The Last of the Mohicans, The Pathfinder, The Pioneers,* and *The Pirate,* ranging in date of writing from 1826 to 1841. The chief hero appears in different novels as Leatherstocking, Hawkeye, Natty Bumppo, and La Longue Carabine (The Long Rifle). He wanders over hundreds of miles of dark, unsettled forest, acting as trapper, guide, and agent of the government. Force, honesty, and absolute fearlessness are the main traits of this and other characters of the Leatherstocking group.

Leaf in a Storm, A, by Louise de la Ramée, better known as Ouida, is a tract against the inhumanities of war between nations. When the conflict with Germany broke out in 1870, many simple French peasants lived happily in a small hamlet toward the eastern part of France. Like a great unstayed tide the armies rush over them, leaving a burned town, many homes without fathers, and many sweethearts without their young men. Just as a leaf is blown before a storm, the cruel breath of war carries the noblest away never again to return. Ouida's story is fresh, vivid, and sympathetic. Another story from the same pen is *A Dog of Flanders*, one of our noblest animal short narratives.

Legend of Sleepy Hollow, The, a short tale by Washington Irving, was first published in 1819. It tells mainly of the startling adventure of one Ichabod Crane, who looked much like a scarecrow in his ungainly ugliness. Ichabod, the village schoolmaster, is interested in Katrina Van Tassel, daughter of a prosperous farmer, but he has at least one formidable rival, Brom Bones. On one occasion, as Ichabod returns home late at night, he is pursued by the Headless Horseman, a legendary rider of the neighborhood. Ichabod is speechless on seeing a head hanging at the saddle. The horseman finally rises in his stirrups and casts the head at Ichabod, who is so terrified that the region never afterward sees him. Later, when the story was told in the presence of Brom Bones, that gentleman was known to assume a peculiar, knowing look. Irving's tale, as well as the *Rip Van Winkle*, makes humorous use of local legends with singularly telling effect.

Les Miserables by Victor Hugo is one of the world romances of tremendous power. It describes the Paris of the nineteenth century, with the evils of the professional police system, and the fatalism which may pursue an innocent man when he is persistently hunted down by officers of the law. Jean Valjean, the hero, is an epitome of French peasant character, noble against odds and willing to undergo superhuman trials for those who will trust him. For stealing bread for his sister's starving children, Jean is condemned to the galleys for five years, a time eventually lengthened to nineteen because of his attempts to escape. When he is released at last, Jean persuades a Bishop to accept him as servant; but he cannot resist the temptation to steal the churchman's silver, since a long imprisonment has made him indifferent and cynical. Jean is brought back for identification by the police, but the good bishop, understanding the situation, swears that he has given Jean the things he has stolen. This unexpected kindness softens a heart made stony by injustice.

The police prefect, however, named Javert always pursued Jean, on the principle that a man once in prison must, of necessity, always remain a criminal. Through almost endless ramifications the story runs with increasing interest. Jean becomes a rich manufacturer, mayor of his town, and a friend of the poor and downtrodden. Yet the police pursue him, and he is recognized as a former conviet, disgraced, and stripped of most of his old friends. He rescues from shame a girl named Fantine, who soon dies leaving a child named Cosette. Again Jean Valjean serves in prison for another man whom he resembles. He returns from the galleys in time to rescue Cosette, who is engaged to marry a young man named Marius. The latter misunderstands Jean Valjean, who goes away, so that no suspicion may fall on those he loves. Finally, Marius learns that Jean has really saved his life, but, when he at last finds his benefactor, it is almost too late; for Jean is at the point of death.

Besides the details of the narrative itself, forged white-hot out of a great imagination, Hugo introduces some famous descriptions of the battle of Waterloo; of the sewers of Paris, though which Jean flees with Marius; and of the barricade across the streets where many meet death and a French lad stands heroically gathering bullets as he is exposed to the enemy fire.

Lilliput is the land of diminutive men in Swift's *Gulliver's Travels*. The entire account of these people is a satire on the smallness of mankind. Swift narrates at length the story of the Big-endians and Little-endians, who fought for many years over the proper way of breaking an egg. "All true believers break their eggs on the convenient end," said their book of law. An ancient emperor, happening to cut his finger while breaking the large end of his breakfast egg, decreed that henceforth all the faithful must break the small end. Thus the controversy arose; many learned books added fuel to the flame; and at last some of the noblest of the tribe suffered martyrdom for their faith.

Little Nell, as described by Dickens in his *Old Curiosity Shop*, is among the most pathetic characters in literature. Driven by fear of a rascally man named Quilp and by the strange actions of her grandfather, an old man in his dotage, Little Nell finally persuades him to leave their home and wander forth in search of a better place. They live for a time in the fields and endure many hardships, until finally Little Nell comes to a sad deathbed among strange scenes.

Lochinvar, a bold Highlander in Walter Scott's *Marmion*, loved a lady, who was betrothed against her will to another, a man who is called a "laggard." He asked a dance of the bride at the wedding, and, before the astonished bridegroom and guests could interfere, lifted her up beside him on his horse, and dashed away. This story in Scott's poem revives an old ballad.

Locksley Hall and **Locksley Hall Sixty Years After,** two poems by Alfred Tennyson, were published in 1842 and 1886 respectively. The petulant hero of both declaims against his cousin, Amy, who forsook him, at command of her father, to marry a man of wealth. He takes refuge from his bitterness in the contemplation of the future of England and of science. "Thro' the shadow of the globe we sweep into a younger day, Better fifty years of Europe than a cycle of Cathay." In the second poem, with some bitterness left, the speaker recalls the death of Amy many years ago and now that of her husband, late master of Locksley Hall. Both lyrics have a wealth of description and considerable nervous energy.

Lord Jim is a picturesque romance in the best style of Joseph Conrad. Realizing that he has been a coward, a man finds a new life far off in a land of uncivilized tribes. They learn to trust and love him, and tragedy comes only when other white men arrive to disillusion the natives who have thought all men of their kind as noble as Tuan Jim, who is truly large and heroic, strong in death.

Lorna Doone is a brilliant romance of the country of Exmoor in Devon, west England. It is the masterpiece of R. D. Blackmore, being written in the style of the seventeenth century when the events are supposed to occur. John Ridd, a lad of fourteen, whose father has been slain by the wild Doones, ventures up a small stream in search of fish and meets with a fair young miss who says she is Lorna Doone. When he is older grown, he returns again, and from that day thinks of eventually rescuing Lorna from the cruel and vicious life that is common among her people in Doone Valley. For years nothing further happens, while the farmers of the region are content to leave the Doones alone, just so long as they do not steal too many cattle from the neighborhood. At last, during a great storm in winter, John succeeds in bearing Lorna out of the valley. As they stand at the altar of the little church not far away, a bullet from the gun of Carver, one of the last Doones, strikes Lorna down in apparent death. John rushes out to seek his revenge. He encounters Carver Doone on the edge of a morass, into which Carver sinks in trying to protect himself from the strength of his antagonist. Later John and Lorna live through many happy and peaceful years. Though the story is of cruel and bloody days, simple strength and unassuming beauty mark it as uncommonly attractive. An atmosphere of lyrical charm pervades almost every description and bit of story.

Luciad is the national epic poem of Portugal or Lusitania, as this land was once called. In form and spirit it resembles some of the old classic poems, with many noble passages.

Luck of Roaring Camp, The, is the title narrative of a volume of short stories by Bret Harte. It revives the days of the early rush for gold in the western part of the United States. The "Luck" is a baby, born to the only woman of the town, who soon dies, leaving the child to rude and lawless men. Through the child a new spirit settles among the entire population. At last both the babe and its keeper are drowned in a great flood.

Lycidas, the pastoral elegy by Milton, remembers the life and characteristics of his friend, Edward King, who had been drowned in attempting to cross the Irish Sea. Milton introduces the classical mythology into the poem, speaks of the days when he and King were students together, calls on the shepherds to weep for Lycidas, and introduces a celebrated flower passage, which was sharply criticized by Ruskin for being not true to nature. This lyric became the model for later poems of the type, such as Shelley's *Adonais* and Arnold's *Thyrsis*.

Lydia Languish, in Sheridan's comedy *The Rivals*, is a young miss who reads romantic novels from the circulating libraries, when Mrs. Malaprop, her aunt, thinks she is reading more solid books.

Mab, queen of the fairies, finds a place in several English poems and dramas. Usually she is mentioned

as the wife of Oberon. Both Shakespeare and Milton speak of her more than once, but Titania is the consort of Oberon in *Midsummer Night's Dream*. In Welsh legend Mab came at night and played pranks on slovenly housewives.

Macaulay's Essays, a miscellaneous series, began with the publication of the essay on Milton in the *Edinburgh Review* in 1825 and concluded with the brilliant account of the Earl of Chatham in 1844. With a great store of information and concrete details, they bring to popular attention many historical, literary, and social subjects of the nineteenth century. In style they are rich, compact, vivid, and often rhetorical, with many antitheses and other figures for emphasis.

Macbeth, Shakespeare's great tragedy, is notable for its picture of the decline of two human souls. Macbeth, a highly imaginative man, lacks force of character; his wife, quite the contrary, lacks no degree of will to carry her designs into action. Blinded by ambition, they conspire to kill the old king Duncan, while he visits them, and Lady Macbeth takes the lead in seeking to avoid the consequences of their rash act. Macbeth meets the three weird sisters, on different occasions; they lead him on to his own doom by means of ambiguous prophecies of fame and power. A fellow officer with Macbeth must needs be silenced to avoid suspicion. Macbeth, by means of agents, adds the murders of Banquo and Macduff to his list of crimes. Unable to bear the strain longer, Lady Macbeth breaks in mind and reveals some of their secrets while she walks as in a dream. After her untimely death, Macbeth is left alone with his remorse and further plans to make his throne secure. Gradually the tide rises against him, and at last he meets death in a great battle, being swept onward by his confidence in the false prophecies and by his own ambition. This drama stands among the great plays of human retribution for energy of the plot, consistency of the characters, and wealth of imagination. Though the witches and the ghosts in the play now cause some confusion to a modern reader, they undoubtedly suited popular taste and belief in Shakespeare's time.

Mac-Flecknoe, a satirical poem by John Dryden, was published in 1682. It lampoons Thomas Shadwell, a rival dramatist and poet, making him out a son of Richard Flecknoe, an obscure and petty rimer of the age. Shadwell is set up as king in the realm of dunces. Two memorable lines, somewhat typical of all, are these: "The rest to some faint meaning make pretense, But Shadwell never deviates into sense." Dryden is never as vindictive and personal as Pope in his satires, and yet this poem stings like a taskmaster's lash.

MacIvor, Fergus and Flora, a Highland chieftain and his haughty sister, entertain Edward Waverley on his visit to the north, as fully described by Scott in his novel, *Waverley*, the first written of the series of some twenty-seven long stories. Fergus plans that the English visitor shall marry Flora, but she and Edward think otherwise. One of the great scenes of the novel is the parting of the hero and Flora from Fergus, when the latter is led away to be executed for treason.

Malaprop, Mrs., is a presumptuous dame in Sheridan's *The Rivals*. She uses many real words in wrong senses, as when she speaks of a "nice derangement of epitaphs" for *arrangement of epithets;* "caparisons" when she means *comparisons;* and "positive conjunctions," when she should have said *positive injunctions*. At present a malapropism is the unintentional misuse of words as if by Mrs. Malaprop herself. Sheridan may have had Dogberry of Shakespeare's play in mind, though this blunderer makes somewhat different mistakes.

Manfred somewhat resembles Faust in literature. As characterized in Byron's poem bearing this name, he has seven spirits to do his bidding,—earth, ocean, air, night, winds, mountains, and the star of his own destiny. Yet Manfred dwells in proud isolation at his castle among the Apennines, being punished for selfishness and presumption. Once he is visited by Astarte, whom he loves, but she foretells his own death on the following day.

Man Without a Country, The, a didactic story by Edward Everett Hale, tells of the pathetic life of Philip Nolan. In the early days of the American Republic, young Nolan fell under the baneful influences of Aaron Burr, who designed to found a great empire west of the Mississippi. When Nolan was called into court for his part in these plans, he swore with an oath that he never wanted to hear of the United States again. The judge sentenced him to have the wish fulfilled. Nolan was accordingly sent aboard one ship after another till the end of his long life. After a number of years, nobody at Washington knew anything about his case, and he was never pardoned, though some attempts were made to restore him to his country. Whenever the vessel bearing him neared a shore of the United States, poor Nolan was transferred to another outward bound. Several tense and pathetic incidents developed. On his death bed Nolan was permitted to learn of the history of his native land since the time of his sentence. Previously any papers handed him were clipped if they mentioned the United States. He bequeathed a lesson of patriotism to the youth of America.

Marble Faun, one of Hawthorne's romances, tells a powerful story of human retribution for sin. This book, written while Hawthorne was abroad, is filled with the spirit of old Rome and the art of former ages. Some of the events in the narrative are dark and mysterious, quite in keeping with Hawthorne's methods of philosophical analysis.

Marse Chan, one of many short stories by Thomas Nelson Page, interprets life in Virginia in the period of the Civil War. An old negro servant, for years in the family, is the narrator. Young Massa Channing loves the daughter of Colonel Chamberlain, a neighbor. Differences in politics separate the two families, until Marse Chan enlists in the army and soon afterward is killed in battle. Anne Chamberlain is remorseful because she sent him out with a very cold good-bye. She comes to live with Channing's old parents, and remains till she too is buried in the little family plot. Besides a moving and pathetic story of separation, this introduces us to the characteristics and genuine dialect of an old negro, who is always sympathetic with the family he served. Even Marse Chan's lazy and fat old dog to him is almost sacred.

Marvellous Boy is an epithet applied to Thomas Chatterton, son of a poor teacher in Bristol, England, born in 1752. He wrote poetry at twelve, soon afterward forged various documents which people of his town thought real, and later claimed to have found in an old church certain manuscripts of one Thomas Rowley. These were pronounced spurious. Chatterton wrote many excellent poems of his own, went to London in the spring of 1770, had for a time some prospects until his patron died, and committed suicide in August, at the age of seventeen years and nine months.

Meg Merrilies, the old gypsy, is able to save Henry Bertram in Scott's *Guy Mannering* at the cost of her own life. See the account of the novel on a previous page.

Merchant of Venice, The, is the combination of three ancient tales in Shakespeare's comedy: the story of the merchant who thought his ships were lost; the story of the rich but vindictive Jewish money-lender; and the story of the winning of a wife through the wise choice among three caskets containing various articles. Antonio borrows money of Shylock, the Jew, to help his own friend, Bassanio, agreeing in a fit of confidence to allow a pound of flesh to be cut from the spot just over his heart, if the money is not returned on a specified day. When the ships are thought lost, and the money falls due, Shylock refuses to take anything from others, insisting on the literal fulfillment of the agreement, as "nominated in the bond." At last, appealing to a learned doctor of the law, they are notified by Portia (sweetheart of Bassanio in disguise) that Shylock may have the flesh, but not a single drop of Christian blood with it. With terrible groans, Shylock abandons his purpose, offering to pay almost any amount if they will free him from the charges of extortion and intent to kill. In the meanwhile, Jessica, his daughter and another friend of Antonio have eloped, taking the keys and much of Shylock's treasure with them. Bassanio has chosen the casket that contains Portia's picture, and hence the lovers are permitted to wed. At last Antonio learns that some of his ships have weathered the storm. Besides a plot, replete with incidents and minor elements, this drama pictures human character most truly. Shakespeare also tries to secure some measure of sympathy for old Shylock, in spite of his seeming cruelty, which was brought forth by real and fancied wrongs.

Midsummer Night's Dream, one of the playful comedies by Shakespeare, combines many elements loved by playgoers of 1600. There is romance, three sets of characters, confused identity, much humor, and some mild horse-play, reconciliation and restoration. Two groups of lovers wander in the forest, but Demetrius has forgotten his love for Helena and is seeking Hermia, the beloved of Lysander. Oberon, the king of the fairies, in pity for Helena, sprinkles some magic juice of the flower called love-in-idleness on the eyes of Demetrius, and thus restores his love for her. Puck meanwhile has caused amusing confusions, since he has anointed the eyes of the

wrong man by mistake. The fairies, too, confuse their identity. Titania, Oberon's queen, imagines she is beloved by an ass; while Bottom, the weaver, touched by the magic liquor offered by Puck, calls for oats and hay. There is also a lightsome plot of a play of Pyramus and Thisbe, as enacted by some rustics and artisans, with queer stage properties. For instance, Snout, the joiner, represents a wall as he stands holding some lime, plaster, and a stone in one hand, while he uses the other to represent a chink in the wall for the lovers to talk through. Altogether things happen as they might indeed if all the actors of the play were really victims of midsummer madness.

Miller, Daisy, as portrayed by Henry James in his novelet, is a young, innocent, but very unconventional American girl in Rome. Contrary to advice of friends, she does not "do as the Romans do" in social matters, but conducts herself in a careless, free manner as she would in her own small town in a western state. Her former friends, therefore, one by one desert her; and when those she most respects treat her coldly, she is deeply hurt. When she dies of a fever caught in the night air, while viewing the moonlight from the Colisseum, the narrator of her story feels that some injustice has been done her. The novelet, when first published, ranged many people on both sides, as to whether it is a correct picture of an independent American girl.

Mill on the Floss, The, by George Eliot, is a novel of English middle-class life in a small community. Out of unfavorable surroundings, the life of a young girl develops into pathetic tragedy. Maggie Tulliver, an impressionable "clever" girl, is misunderstood by all except by her father. Most of her relatives are stolid, matter-of-fact people, with no atom of romance in their souls. Her brother Tom is typical of the unimaginative, practical, harsh brother, though he has some rude affection for Maggie. George Eliot paints a realistic picture of the trials and sorrows of child life among these circumstances. At last Maggie becomes interested in Philip Wakem, a deformed and girlish young man, who is the son of Mr. Tulliver's chief enemy, a lawyer who has helped win various suits started by Maggie's father over water rights at his mill. On positive commands of Tom, after her father's death, she gives up all thought of marriage with Philip. Quite unconsciously and innocently she allows Stephen Guest, the avowed lover of a cousin, to become enamored of her. He takes her out on the Floss rowing, and before Maggie fully realizes, they have gone so far that it is the next day before they can return. Maggie is then suspected by all her acquaintances, and even Tom turns harshly against her. Independently she learns to make her living as a teacher. When a great flood rushes down the River Floss, Maggie and Tom are caught in its fury, and both go down forever, "living again in one supreme moment the days when they had clasped their hands in love and roamed the daisied fields together." This powerful novel raises the question of whether an author should make a story terminate happily. George Eliot, however, shows from the first chapter that all the conditions are tending toward a tragic ending. Apart from the plot itself, and the study of the characters of Maggie and Tom, various relatives on both sides of the house, leave little to be desired in intimate, realistic, and vital humanity.

Mr. Isaacs, earliest novel by F. Marion Crawford, is the history of a highly-born Persian, who lacks no noble quality save reverence for women. He thinks and speaks of his three wives with indulgent contempt. Paul Griggs, who tells us the tale, meets Mr. Isaacs at Simla, admires him from the start, but suggests at once that women indeed do have souls. Shortly afterward, Mr. Isaacs meets and admires a beautiful and frank English girl. Gradually they fall in love with each other. Through various refinements, the affection of Mr. Isaacs rises to a height of sublimity, which even the death of his beloved does not materially change. Though a much saddened man, he continues to live in a lively hope for the return of the golden days of his courtship; or, as he expresses it, he awaits "longingly the first faint dawn of the day eternal." Much of the atmosphere of the romance is that of the mysticism and spiritual longing of the yogis of India.

Modern Painters by John Ruskin began in 1841 as a defense of the art of the English painter, J. M. W. Turner. In succeeding volumes Ruskin enters into the entire history and principles of art since the days before Raphael in Italy. Many florid descriptions make the first editions of this elaborate work unusually attractive. In later forms, however, Ruskin omitted some of the vivid passages, and toned down his entire enthusiasm for the art of Turner.

Mosses from an Old Manse, written in 1846, is a collection of short stories by Hawthorne. Like the *Twice Told Tales,* they divide into several classes, according to subject and style of treatment. Some of the earliest are hardly more than descriptive sketches like *Sights from a Steeple,* a detailed report of what a man might witness from the high spire of the town church; *The Old Manse,* a description of the home of the ministers of the parish church of Concord, where Hawthorne lived as he wrote some of these stories; *A Rill from the Town Pump,* avowedly a temperance sermon preached by a town pump at high noon of a hot day in summer at Salem; *The Maypole of Merry Mount,* a picturesque incident of the early Plymouth days showing that some of the earlier settlers desired thoughtless mirth; and *The Gray Champion,* a sketch of the resistance of the Colonists to the encroachments of the governors before the time of the actual Revolution. Another class includes *The Great Stone Face,* an allegory of character; *The Birthmark* and *The Artist of the Beautiful,* both different phases of unwise and tragic ambition, carried to an extreme; and *Rappaccini's Daughter,* a subtle discussion of relationships between rumor and actual truth as to the girl whose breath was supposed to be poisonous because she was fed on drugs or breathed the odors of noxious flowers. These, with other gradations of history and romance, make up two fine collections of tales that always appeal to the imagination of young readers. Though deficient in the sense of reality, or of actual life, many of these stories introduce one to the moral realm and the soul of mankind as shown in reference to action.

Mother Goose's Melodies, that captivating series of rimes for the nursery, has influenced generations of children. Some of the verses go back to a French collection of 1628, which was known in England as early as 1729 and translated in 1760. A few of the stories in modern collections go back to the age of Shakespeare in England; and a few may also be of American origin. Once it was thought that Elizabeth Vergoose, mother-in-law of Thomas Fleet, a Boston printer, was the originator of the rimes. This ascription is now doubted in view of the previous collections containing some of the stories printed in Boston, where editions surely appeared as early as 1824. *Little Boy Blue, Baa, Baa, Black Sheep, Bye, Baby Bunting,* and *Patty Cake,* with scores of others, are well known to many children of our age. Such stories do not contain elements that set children against going into the dark, or turn them toward bad dreams while they sleep, as many of the books of fairy tales do.

Mysteries of Udolpho, the masterpiece of Mrs. Ann Radcliffe, 1795, belongs decidedly to the moonlight type of fiction. It was once cited as the best of the gothic romances,—those tales of wonder, secret underground dungeons and caves, music coming from mysterious sources, old papers and wills newly discovered, and love-lorn maids separated from noble lovers and enduring torments of soul while imprisoned in dark towers, or while imagining they heard the sounds of voices or footsteps. Emily St. Aubyn, an English girl imprisoned in a castle in the Apennines, is the hero of Mrs. Radcliffe's novel. She is held virtually a prisoner by the husband of her deceased mother, until she is liberated by the Chevalier Velancourt. Walter Scott once said of this romance that "Its magnificence of landscape, and dignity of conception of character, secure it the palm."

New England Nun, A, is the title of a volume of short stories by Mary E. Wilkins, now Mrs. Charles Freeman. A prim New England old maid has waited a number of years for her lover to return from making his fortune in Australia. At last, when they meet once more, she begins to realize that she greatly prefers to live her own life in the old manner and not to have an untidy man around the house. Out of a sense of honor, she still is ready to marry, but feels justified in breaking off her engagement when she learns that another stands higher in the regard of her betrothed than she does. This story introduces us to one type of New England maiden lady, of which there are others in various books by the same author. *The Revolt of "Mother"* by Mrs. Freeman tells a somewhat different story.

New England Primer, The, passed through many editions before the coming of the modern spelling and reading books. It combined the catechism with secular instruction of various sorts, with selections for memory, moral instruction, spelling, and even bits of arithmetic. Some of the old crude wood-cuts are eloquent of Puritanic ideals of early days. "Time cuts down all, Both great and small" is the legend under a picture of the Grim Destroyer mowing with an ancient scythe. Job with his loathesome sores is pictured as an example of resignation and obedience.

Nicholas Nickelby, a young man in a novel of that name by Dickens, suffers early neglect of his mother, a talkative woman, who would rather gossip and complain than do any useful service. She is the type of woman to exclaim, "Well, I expected as much" when anything extraordinary happens. Nicholas becomes an usher in a school kept by Mr. Squeers of Dotheboys Hall, where pupils are whipped, starved, and abused in almost every manner, by an ignorant, over-bearing pedagog of no character or ability. At last Nicholas leaves, followed by an admirer named Smike, a poor boy who later dies. Nicholas at last becomes a prosperous merchant. In this novel, as in *Oliver Twist,* Dickens spoke so bitterly of certain kinds of private schools that many in England were forced to close their doors.

Novum Organum, one of the prose works of Francis Bacon, outlines his ideas of the scientific method, or the process of logical induction as applied to experiments. Thus he developed at length the system of proceeding through observation of facts to draw general conclusions from them. His view of life was mainly naturalistic, as shown by one of his favorite aphorisms, "Man, the minister and interpreter of Nature, can do and understand only so much as he has observed in her: more he can neither know or do." Bacon speaks of four idols that stand in the road to progress: Idola Tribus, or custom; Idola Specus, individual prejudice; Idola Fora, wrong notions or traditions formed from speech and human actions; and Idola Theatri, fables and fictions.

Nut-Brown Maid, one of the old ballads, narrates the story of an outlaw who woes a maid, but tells her frankly of the many trials and misfortunes she may have to undergo. She gladly promises to share them all with him, if he will remain her true knight. Then he reveals himself as an earl's son, wealthy and famous.

Oberon, king of the fairies, appears under different names and disguises in world literature. One old story relates how he and Titania once lived in India, but came to Europe centuries ago to dance in the moonlight. Shakespeare pictures them fancifully in *Midsummer Night's Dream.*

Old Chester Tales interprets the small country village and its different inhabitants, with humor, much insight, and sympathy. Old Dr. Lavender, the town rector, appears in many of the stories, as do some of the other people. Mrs. Deland, the author, also wrote the novel, *The Awakening of Helena Ritchie,* besides other volumes of Chester stories.

Old Creole Days, by George Washington Cable, a group of short stories, introduces us to life in New Orleans in the days over a century ago. They are characterized by a romantic local color, feeling for the old families, and deep regard for human character. Some of the best stories tell us of old Jean ah Poquelin, a man who sheltered his brother who was a leper, at great risk and cost to himself; Posson Jone', a humorous old colored preacher; and 'Tite Poulette, a young girl in need of friends in a city.

Oliver Twist, a famous novel by Dickens, introduces us to at least twenty types of character. The hero is a lad born in the workhouse and named Twist because the keeper had arrived at the *T's* in naming the waifs under his charge. Little Oliver distinguishes himself and greatly amazes an attendant when he calls for a second dish of porridge, an unheard of bit of boldness in that home for orphans. He escapes at length, finds his way to London, and there falls into the hands of the Artful Dodger and other vicious men who endeavor to teach him to steal in a school for criminals kept by one Fagan, a Jew. Oliver refuses to become a pickpocket, escapes, but is returned to assist Bill Sykes, a notorious house-breaker. Nancy, living with Sykes, a woman of no reputation, takes pity on Oliver and treats him kindly. His later life, with some discouragements, is spent with honest people; while friends protect him from the police, until Oliver finds his sister, of whom he had not previously known. At last the gang of thieves all meet an end due their boldness and treachery. Dickens professed that his motive in such writing was to show vice and crime in their true repulsiveness.

Omar Khayyam, or the Rubaiyat of Omar Khayyam, a Persian poem of some uncertain date, was translated into English by Edward Fitzgerald in 1859. It consists of a string of meditative verses, some of which are musical and attractive. Man is likened to a pot of clay; life to a mere day's journey. Since existence is thus so short, why not enjoy it to the full while it lasts? This is the philosophy of *Omar Khayyam.*

Ossian or Oisin, an ancient Gaelic bard, according to James MacPherson, a Scotch teacher, left some manuscripts which were translated into modern English. The Ossianic poems, as given to the world by MacPherson, consist of rhapsodies in a measured prose, full of strangeness, repetition of epithets, wild scenery, and a moaning of old heroes. Dr. Johnson and others since his day have pronounced the poems as we have them a forgery, but many still believe that MacPherson had at least oral tradition, possibly some fragments, that he used in the various parts.

Painter's Palace of Pleasure, a collection of many narratives, published in 1566, became the storehouse from which dramatists and poets drew many tales and plots. Our chief interest lies in the fact that this work brought many of the best stories from the Orient, and contributed to Shakespeare some material for his *Timon of Athens, Romeo and Juliet,* and the main plot of *All's Well that Ends Well.*

Palamon and Arcite illustrates the stories that travel from age to age and country to country. Boccaccio gave it to Chaucer, and Chaucer bequeathed it to Dryden. Others also have used it as a whole or in parts. Arcite, a young knight of Thebes, is made prisoner and confined in a tower by Duke Theseus of Athens. One day, as they are viewing the scene in the yard below, he and Palemon, a fellow prisoner, notice a beautiful lady, who proves to be Emily, the king's sister-in-law. One man insists that Emily must be his bride, since he saw her first; the other, because he thinks he actually loved her first. After they are released, Theseus holds a tournament to determine the affair. Though Arcite wins in the combat, he dies of a fall from his horse; and so Palamon, after all, wins Emily.

Pamela, first of three romances by Samuel Richardson, is usually called our earliest novel of character and analysis. Before it was published in 1740, many long stories had been written, but few of them, if indeed any, covered more than the outlines of the plot. Richardson, a printer, conceived the idea of weaving a story into some familiar letters. He had a highly moral motive in mind, that of instructing the young in virtue and manners. His heroine, a serving girl, is pursued by the young man of the household. After many repulses, he finally offers to marry her, and Pamela consents. A second part describes the life of Pamela and her Mr. B. at their beautiful estate in the country. Many critics found fault with the conclusion of the story, saying it might teach all servants to try to win their masters. The change of motive in Mr. B. was not very convincing. This novel, however, set the fashion of long fictions for many years.

Paradise Lost, the sublimest epic poem in English was written by John Milton "to justify the ways of God to men." It contains some of our finest blank verse for musical effect, and was published in 1667. Book one opens with the awakening of the angels from the stupor into which they were cast when they fell for nine days from Heaven into a burning lake of marl. After a consultation, described with great poetic power, the demon hosts agree to send Satan as an emissary to spy out a new land called Earth, on which report says a new race called Man has been created. The rest of the first four books details the flight of Satan through the vast universe to the planet where man resides. The angel Raphael, in the second set of four books, describes the war in Heaven, bringing the account up to the time when the angels awoke upon the burning pool. The final four books describe in considerable detail and vividness the temptation of man by the serpent sent by Satan, his fall and expulsion from Paradise, and some of the plans for his final redemption.

Pickwick Papers, a long rambling narrative by Dickens, contains the experiences of the club founded and presided over by Mr. Pickwick. The gentlemen described as chief members travel through England, fall into many droll adventures, which culminate in the celebrated suit of Mrs. Bardell against Mr. Pickwick for breach of promise. Mr. Pickwick, a lodger with Widow Bardell, starts to inform her that he is about to change his condition by taking a man servant. Before he has time to explain, Mrs. Bardell thinks he is proposing to her, and afterward enters a suit for damages. The companions of Mr. Pickwick, overhearing only a part of the conversation, and putting some wrong constructions on Mr. Pickwick's acts, offer rather ambiguous testimony in court, and their chief loses in the suit. Sam Weller, man of all work for Pickwick, proves the star witness, provoking much amusement in the court room.

Pied Piper of Hamelin, originally a German folk legend, as used by Robert Browning, has become a popular story

for the young. A wandering musician for a reward agrees to rid the town of Hemel of its myriads of rats. He completes his task and claims the reward, which is withheld from him. In revenge he blows his horn once more, and all the little children of the place flock out and follow, as the rats have done, wherever he leads, until they enter the side of a mountain and never more return. Thus the ingratitude of the town is punished.

Piers Plowman is the work of an obscure poet in the time of Chaucer, who wrote what has been called "The Divine Comedy of the Poor." It is in form of a dream, descriptive of a fair field full of people, of all conditions of life. The author speaks against luxury, oppression of the poor by the wealthy, and announces himself as a champion of the oppressed working classes. William Langland or Lack-land is the name given as that of the author of this poem.

Pilgrim's Progress, the most imaginative allegory in English, is a prose narrative by John Bunyan, which was published in 1678. After forming a resolve to journey to the Celestial land, Christian sets forth from his home alone, all others having refused to accompany him. Many hard passages of the journey are traversed with great peril and pain, some of which are the Slough of Despond, the Hill Difficulty, the Castle of Giant Despair, the country where Appolyon stands guard, and at last over the ferry to the shores of the better land. Along part of the way, Interpreter offers him companionship and good advice. Many worldly people try to dissuade him or attract him to their own plans or pleasures. Faith, Hope, and Charity at last are his main reliance. Few works have charmed the imagination of old and young, rich and poor, lettered and unlettered, as has this simple story of Christian and his Progress.

Pilot, The, by James Fenimore Cooper, is one of the finest sea tales in English. Written by a man who knew the sea at first-hand, the narrative abounds in nautical terms, discourse on the management of a great schooner in a storm, and the fascinating story of a battle on the high seas. The pilot turns out to be John Paul Jones, founder of the United States Navy. Though there is romance in the novel, we turn away from the fine ladies and conventional lovers in all Cooper's books, and here we follow the fortunes of Long Tom Coffin, as true a tar as ever walked the deck. Long Tom is the Leather-stocking of the Navy. It has been asserted that this novel was called forth in 1823, when Cooper became disgusted with the descriptions in Scott's *Pirate*.

Pippa Passes is a lyrical drama by Browning. A little shop girl, out for her single holiday from work in the whole year, goes along the streets singing her happy song, "God's in his heaven, all's right with the world." Quite unconsciously she influences the lives of a number of careless and sinful people and makes them think of nobler deeds. At night Pippa returns homeward, feeling that she has enjoyed every minute of her holiday.

Pride and Prejudice by Jane Austin is a model of realistic style in a novel of country life. Published in 1813, but written in 1796, it shows how pride in a man and prejudice in a lady kept them both from realizing how much they cared for each other. Elizabeth Bennett thinks Mr. Darcy is conceited and proud; he believes her to be prejudiced and distant. Of the five sisters in the family, Elizabeth is preferred by her father, who is a humorsome, cynical man, given to tart remarks, but at heart a kind father. Mrs. Bennett is a busy-body, trying to marry off her daughters; and at times she does not seem to pick future husbands very wisely. She designs that Elizabeth shall marry a clergyman named Collins, who pays the family a visit and proves he is impossible from almost every angle, since he is a narrow, pedantic, patronizing man. Various balls and parties among the gentry of the region are described happily. Along with the interest in the progress of a seemingly impossible romance, one is charmed by the gentle satire and insight of the author. Some of the minor characters move in a clear sunlight. Jane Bennett, the eldest daughter, marries Mr. Bingley, a young man who has taken a neighboring place for a time. Finally, Mr. Darcy writes Elizabeth a proposal of marriage, and thus relieves a situation which looks almost hopeless up to that point.

Princess, The, a narrative poem by Tennyson brings out some of his thoughts on the education of women, management of business, and the franchise. Certain learned ladies founded a college, from which men are to be rigorously excluded; but the heart triumphs over the head, and the love of children and home come uppermost and break up the model community in which the college is situated.

Prisoner of Zenda, The, is one of our best adventure novels. Almost every page thrills with tense situations, plots, and counter plots. An Englishman named Rassendyl, happening to be in Ruritania when a new king is to be crowned, becomes an unwilling actor in many events. The king is a member of a drinking party, on the eve of his coronation day, is drugged, and cannot be made presentable at court. A wily brother hopes to steal the throne. The foreigner strikingly resembles the recreant monarch, and very reluctantly he assumes his place in the coronation exercises. All three men,—king, brother, and the visitor from England,—admire the Princess Flavia. She shows a decided partiality toward Rassendyl, thinking he is the king; and so new complications arise, for the Englishman constantly fears that she will detect that he is playing a part. After many narrow escapes, all events mold themselves so that the king is restored to his honors and to the affection of the Princess. *Rupert of Hentzau* is a sequel to *The Prisoner of Zenda*. Anthony Hope is the author.

Quentin Durward, a dramatic novel by Scott issued in 1823, is the characterization of Louis XI of France, a Scotch lad, and minor persons. Quentin Durward, on a visit to a relative in the King's guard of honor, is noticed by Louis, and later saves the monarch's life from an attack by a wild boar while the king is hunting. Louis sends two noble ladies to the court of the Duke of Burgundy, where they nominally belong. Quentin, chosen as their escort, runs through several puzzling adventures. It transpires later that Louis designed that the ladies should fall into the hands of William de la Marck, called the Wild Boar of the Ardennes. Quentin delivers the ladies into the care of the Bishop of Liege, whom William slays with his own hand most brutally. At last Louis XI pays a visit to the Duke of Burgundy, and in a tense situation, convinces the rival monarch that he is a faithful ally. In a tournament, proposed by the Duke, Quentin bears off the prize of the lists, with the help of his uncle. The fair Isabelle is that prize, and fortunately she already has a high regard for the Scotch youth. Despite a few historical errors, this novel revivifies the reign and character of the wily Louis in a manner that has greatly pleased the French themselves. The craft, superstition, and tremendous ability of this French king appear in true colors.

Rab and his Friends, one of our best dog stories, was written by a physician in England, Dr. John Brown. The faithfulness of a dog to his true friends is pathetically illustrated.

Rabbi Ben Ezra, Robert Browning's optimistic poem, celebrates the joys of growing old. "Grow old along with me, The best is yet to be,— The last of life, For which the first was planned," the first lines, give the sentiment of the lyric.

Ralph Roister Doister, our first native English comedy, shows in a humorous series of scenes the courtship of Ralph and a wealthy widow. Not being able to write, he employs a scrivener, who so contrives an epistle that it may be read two ways by varying the pauses. When it is read to the widow, much confusion results, which only the writer himself clears up when he takes the letter and reads it. The whole belongs to the comedy of manners, bordering on farce.

Rape of the Lock, The, by Alexander Pope, belongs to the literature of cleverness. Almost no other poem shows as vividly as this the fashionable society of the age of Queen Anne. In mock-heroic fashion it celebrates the theft of a lock of hair from the brow of a fair lady, called Belinda in the poem, but really Miss Isabella Fermor in life. Her friends insist that the lock must be returned. The partisans of the thief (Lord Petre in real life) stoutly deny the right to demand it. Pope was called into the controversy, and wrote the poem to reconcile the factions. Much negotiation back and forth followed with stubborn delay, until the lock mysteriously disappeared, or was carried into the air by the sylphs. In terse description, full of vivid strokes, Pope almost excells himself in the description of ombre, a fashionable card game of the period, and in the account of the toilet as made by the lady when she rose about noon.

Rasselas, a prose romance by Dr. Samuel Johnson, relates the adventures of a prince in Abysinnia, who stole away from court without his father's permission. After many experiences in different regions, he is perfectly willing to return home, for there happiness dwells. Like the two long poems by Johnson, this story teaches the lesson that happiness is most elusive when most eagerly sought.

Return of a Private, by Hamlin Garland, contrasts the going of volunteers to the Civil War and their return after the conflict. Mr. Smith (really Mr. Garland'

father) returns from the South to find his farm in a sad state of neglect, with the fences down, the buildings unrepaired, and everything else looking at its worst.

Rip Van Winkle, the story by Washington Irving, has been a favorite since 1819. Some of its elements of popularity are the descriptions of quaint old Dutch times, of the family life of the Van Winkles, of the dog and Rip, the little men on the mountain, and the return after Rip's long sleep of twenty years. Though not a real short story, in the narrow sense, because too many things are mentioned without sufficient emphasis on the main elements, it has been a model for later authors. Irving's urbanity and humor silver the whole plot. As played by Joseph Jefferson, in a dramatic version, Rip Van Winkle became known to thousands of delighted theatre patrons.

Rob Roy, a national romance by Sir Walter Scott, in both the novel and stage versions proved a perennial favorite in Scotland. It is replete with mystery, good descriptions of the Highlands, with their rugged passes, rocks, and mountain lakes, and fine delineations of interesting characters. The story centers in the attempts of Rashleigh, a cousin of Francis Osbaldistone, to steal the family fortunes and wreck the business house of Osbaldistone and Company. In the background are suggestions of the conflicts between religious sects in Scotland, and the warfare between freebooter and English troops. Rob Roy, pictured as a modern Robin Hood, assists in saving the fortunes of the Osbaldistones and in bringing Rashleigh to his death. He also assists Sir Frederick Vernon, who appears as Father Vaughan in a disguise; and at last helps Francis to escape from numerous dangers. Diana Vernon, daughter of Sir Frederick, finally consents to marry Francis, even though he is a Protestant. The chief humor of the play derives from the antics of Bailie Nicol Jarvie, a cousin of Rob Roy a number of times removed. One of the great scenes, when the character was impersonated by Charles Mackay, was the adventure in which the Bailie lost some of his coat-tails when others had to cut him from a tree into which he had fallen in trying to escape from English soldiers. The dramatic version made by Isaac Pocock was the most popular melodrama in Scotland for forty years or more.

Robinson Crusoe stands high among the greatest adventure stories of the world. The details are too familiar to be rehearsed here. Everything is so vividly told that one can hardly believe that the tale did not happen as Defoe tells it. Readers in his day were encouraged by a second part, including the alleged diary of Crusoe, to believe the account substantially that of the mariner himself. Alexander Selkirk, a sailor, had spent some time on an island west of South America, but Crusoe's home is now identified as the modern Tobago, near the mouth of the Orinoco. Yet Defoe's story, in spite of realism, was his own product.

Sartor Resartus, called by Thomas Carlyle, the author, a philosophy of clothes, discusses various subjects and affords a chance to reveal some of the current thought of the early nineteenth century. It is an original combination of narrative, discussion, and sketches. Carlyle calls nature the garments of God. In a biographical portion, the hero passes from the Everlasting No through the Center of Indifference to the Everlasting Yea, "wherein all doubts are solved." The conclusion is that man may do without happiness and find instead true blessedness. The philosophy itself glorifies the mysterious; for all life, says Carlyle, is based on wonder, and everything about us is inexplicable. The style and structure typify the best work of this great author.

Saul, a poem by Robert Browning, has often been called a spiritual tonic. Based on several verses in the Old Testament in which it is said that David called the king back from his melancholy, the poem shows how the lad awakened Saul from a trance by appealing to higher and higher themes, until he announced boldly the coming of the Messiah at some future date. Browning makes David understand fully the nature of the hope of mankind in a sacrifice beyond ordinary men.

Scenes from Clerical Life, are three short stories by George Eliot, in which the romance and the sorrow of a clergyman's life in a small community are faithfully revealed.

Scottish Chiefs, a glowing picture of the stirring days of Wallace and Bruce in Scotland, is historical in its main outlines. It shows how the patriots of the North felt in 1300 toward their southern neighbors beyond the Tweed, vividly retells the story of the wars of liberation, with the succeeding jealousy of the chiefs and the death of Wallace.

Sesame was the magic word used by Ali Baba in opening the door in the mountain where the treasure of the robbers was concealed. *Open sesame*, as a phrase, now means any magical or key word or means of solving some problem. See *Ali Baba and the Forty Thieves*.

Shakespeare's Plays. Several of Shakespeare's plays have been outlined already. Since readers and critics each have individual favorites, a condensed list for beginners is hardly possible. Altogether Shakespeare is credited with thirty-seven plays, three or four of which seem to be not entirely his own work, notably *Timon of Athens*, which has a large section inserted from another hand, and *Pericles*, which has considerable inferior workmanship in various places. Besides, not less than seventeen other plays, in part, have been assigned by some critics to the great dramatist. These are not now included in complete editions of the acknowledged dramas.

Nor is it entirely possible to determine the dates of many of the plays. Only the relative order may be assigned with any confidence, and in regard to this scholars still differ somewhat in minor details. *Romeo and Juliet*, possibly *Hamlet*, *Richard III*, and others in places, were revised and again put on the stage after first production. Many of the original texts are composite products as arranged by scholars from the various quartos and the first folio, or collection of all the plays, published in 1623 by two fellow actors of the dramatist. Textual and linguistic study of Shakespeare is almost a science in itself, but such details do not interest the casual reader, who likes to observe the works as we now have them. In the list printed below, those that apparently are the best are printed in capitals, but not all critics would agree as to the choices.

Shakespeare's work falls into four fairly well defined periods of authorship. These are:

1. From about 1590 to 1595 or 1596. This is the period of beginnings, showing the preparatory work. The dramas are comedies, histories (plays based on English or other chronicles), and tragedies. The technique is not certain, many rimes abound, the characterization and language are not yet perfected. These plays are fairly certain as belonging to this first period:

Henry VI, parts 2 and 3.
Henry VI, part 1.
RICHARD III, *Edward II*.
Comedy of Errors.
Titus Andronicus.
Taming of the Shrew.
Love's Labors Lost.
ROMEO AND JULIET.
MIDSUMMER NIGHT'S DREAM.
Two Gentlemen of Verona.
King John.

2. From 1596 to 1601. This is often called the period of the middle comedies. In three great humorous plays, Shakespeare perfected his characterization, beautified his poetry, and compacted his plots.

Richard II.
MERCHANT OF VENICE.
Henry IV, *part 1*.
Henry V, *part 2*.
JULIUS CÆSAR.
Merry Wives of Windsor.
AS YOU LIKE IT.

3. From 1601 to 1608. This is the period of the greatest tragedies, characterized by depth of insight, turning away from mere word artistry, and dark broodings or the mysteries of life and character.

HAMLET.
Twelfth Night.
Troilus and Cressida.
All's Well that Ends Well.
Measure for Measure.
OTHELLO.
MACBETH.
KING LEAR.
Anthony and Cleopatra.
CORIOLANUS.
Timon of Athens.

4. From 1608 to the end of his writing, about 1614. This is the period of the romantic and poetic comedies. It is characterized by a return to beautiful and leisurely description, poetic diction, and a most kindly view of life as a whole. The plots of the last plays are more simple and the stories less complicated than are those of the other periods.

Pericles.
WINTER'S TALE.
TEMPEST.
Henry VIII.

She Stoops to Conquer, a humorous comedy by Goldsmith, still retains its popularity whenever it is revived on the stage. It was first acted in 1773. Marlow, a diffident young man, is bound for the estate of a Mr. Hardcastle, whose daughter is recommended as an eligible partner for life. Tony Lumpkin, a frolicking ignoramus, the son of Mrs. Hardcastle by a former husband, points out the house of the Hardcastles as an inn for which Marlow and a friend inquire. Various mistakes arise from the mistake of treating Mr. Hardcastle as a landlord, his place as a public hotel, and his daughter as a supposed barmaid. Marlow throws off his supposed bashfulness when he makes love to Kate as the assumed character of daughter of the inn, and she leads him on by allowing him to suppose his early impression is correct. By thus stooping to conquer, she makes her conquest doubly sure. Many droll passages make the play humorous and quite human. Besides Tony, who plays several practical jokes, the servants of Mr. Hardcastle, while taking instructions as to how to appear well before company add a ludicrous part.

Sherlock Holmes, prince of modern detectives in fiction, solves many riddles through his common sense and "science of deduction" in the short stories written by Dr. A. Conan Doyle. When other means fail, and the professional police give up a strange case, somebody appeals to this great man, who smokes a few pipefuls, takes some mysterious liquid from a peculiar looking bottle, or some opiate by means of a needle, and then goes into a brown study. Dr. Watson, friend of Holmes, listens to his explanations and then reports them to the reader. Some of the most fascinating stories are *The Speckled Band, A Scandal in Bohemia, The Red Headed League, A Case of Identity, The Dancing Men,* and *The Copper Beeches.*

Silas Lapham, The Rise of, is by William Dean Howells, an American novelist of the realistic school. It traces the history of a strong New England man from his days of poverty to those of wealth, and from a small country town to Beacon Hill in Boston.

Silas Marner pictures with fine artistry the life of Raveloe, a small mid-England community. George Eliot, the author, was right at home in these surroundings, and gave us some of her best description and character study in this short novel. The main character is Silas, who many years before was driven out of another hamlet by false rumors as to his honesty. His best friend and his sweetheart turned against him. Now a saddened and hard-hearted man, he is living alone in his humble cottage, where he earns his living at the loom. All of his money has been saved, except a mere pittance for his few wants. Silas, soon after the story begins, returns home one night to find that his pile of gold has been stolen. He becomes more of a recluse than ever. At last one evening, as he sits dozing, he looks toward his hearth and sees something like his lost gold. When he becomes fully awake, he finds there a little golden-haired girl. This child gradually wins Silas back to himself again. He comes to regard the welfare of his foster child as much better than all the gold of the world. Refusing aid of all the neighbors, except for some advice from a kindly Mrs. Winthrop, Silas continues to rear Eppie, the child, until she is old enough to marry. Her own father, a prosperous farmer, now comes forward to claim her, but Eppie decides to remain with the man who brought her up rather than go to a fine house to live with the father who refused to acknowledge her all these years. Eppie marries the son of Mrs. Winthrop, and continues to live with Silas. An older brother of Godfrey Cass, her real father, has stolen the gold, which is found, along with his bones, when some stone quarries nearby are finally drained. Few novels describe as impressively as this the wonderful power of a child to transform hard, sodden, and selfish humanity.

Sir Patrick Spens, one of the many old English ballads, in forty-four simple, rugged lines, tells a story that is infinitely pathetic. Sir Patrick Spens, a bold mariner, was commissioned by the Scotch king to go across to Norway to bring home the daughter of the Norse monarch, who was to become the king's bride. The story is founded on a real event that happened in 1281. Sir Patrick knows that to go is almost to commit suicide, but he willingly obeys his king. On the return the boat founders in a great storm and all are lost. It is impossible to tell this plain tale in prose as it is brought out by swift, vivid, and strong diction in the ballad itself.

Sohrab and Rustum, a beautiful epic poem by Matthew Arnold, relates an incident in the warfare between two eastern armies. Sohrab and Rustum are chosen as champions to decide the contest in personal combat, while the armies look on from either side. The fight is described in simple, but most effective words. At last the younger man is wounded. It is only then that they discover that they are father and son. The grief and despair of the old father are powerfully touching.

Spectator, The, an essay in newspaper form, was founded by Joseph Addison and Richard Steele in 1711 and ran for about three years. Modern journalism dates from this foolscap journal, which was found at the breakfast table of many English homes of the period. Addison also set the taste for more than a hundred years for all sorts of genial and familiar essays. Washington Irving was called the American Addison because of his urbanity and graceful style, resembling that of the Spectator papers. Many subjects were treated, but the most celebrated describe the life of Sir Roger de Coverley and other gentlemen associated with him in the Spectator Club, as Addison called his company of friends. Johnson said that whoever would wish to "attain an English style, familiar, but not coarse, and elegant, but not ostentatious, should give his days and nights to the reading of Addison."

Stella was the name given to Esther Johnson by her old teacher and friend Swift. They exchanged tender and sentimental letters, which have led many to believe they were married, but Swift wished for some unknown reason or whim to keep their secret from the world. These epistles, now published though never intended for other eyes by the authors, reveal Swift as a tender and kind man beneath a harsh and overpowering exterior.

Tale of Two Cities, A, differs from the other novels of Charles Dickens, in that incidents are specially stressed, though Dickens here, too, shows his powerful technique as a delineator of human traits. The story affords a colorful picture of many events during the French Revolution, with a weaving of fact and romance in the lives of four people, one of whom pays a great price to save his friend. Dr. Manette for more than eighteen years has served in the Bastile on some unfounded charge. His daughter, Lucie, is now married to Charles Darney, who has also been in prison and has barely saved himself from death. Mr. Lorry, a solicitor of a London business house, and Sidney Carton are their friends, the latter because of a high regard for Dr. Manette and his daughter.

During these days of the Revolution, nobody knows from hour to hour who next will be charged with treason and who will be led to the guillotine because of the testimony of lying witnesses, fired with the zeal of getting rid of enemies of the state. Madame Dufarge and her husband, keepers of an inn, again have Darney, who is a nobleman, arrested on a trumped up charge. Carton realizes that little hope remains. His own life, as he reviews it, has been far from noble or successful; and he now decides to sacrifice all for the good of his friends. Accordingly, he secures access to the prison room of Darney, tries to persuade him, and finally uses other means to get him to leave the place. He quickly changes clothing with Darney who is conducted to freedom outside, and Carton goes to the guillotine, while the old French knitting women sit by and count the number of those executed that day. Darney finds a friend in a little French seamstress as both are on their way in the same batch for execution. The closing scenes of the novel are among the best in our fiction for interest, vividness, and nobility of purpose, in contrast with prejudice, hysteria, and cool inhumanity. Dickens also paints some good pictures of London and Paris throughout the book.

Tales from Shakespeare by Charles and Mary Lamb summarize for young readers the plots of the great dramas. Even for mature students they provide a convenient prose summary of the narratives.

Talisman, The, a romantic story of Walter Scott, outlines some of the incidents of the third crusade about 1200, with much of the imaginary. During a lull in the fighting in Palestine, a Scotch knight whose symbol is a couchant leopard on his shield, falls in love with Edith Plantagenet, nominally a ward of King Richard the Lion Heart. The chief crusader has been suffering of a mysterious malady. An Arab physician (really the Soldan in disguise) comes to Richard's tent and effects a cure by melting the precious talisman in liquid. This amulet or magic stone cures Richard, and Hakim, the reputed physician, leaves for his own abode. Later in the novel he and Richard battle in a personal combat before their armies. The Scotch knight (calling himself Kenneth) falls into disgrace while guarding the English banner from the jealous Austrians under Conrad, who finally tear it down. Richard now disgraces the Knight of the Leopard by sending him away under guard. Eventually, Kenneth proves his faithfulness when he saves Richard from the plots of an assassin, and Richard rewards him with the hand of Edith. The Soldan himself in person has requested Richard to spare this valiant knight. Many stirring scenes add to the vitality of the novel.

Tam O'Shanter, a convivial Scot, according to a poem by Burns, one dark night is returning from the inn to his home. He has to pass by Alloway Kirk, famed for being the haunt of midnight gatherings of witches and other sprites. Tom has been braced by good liquor and incautiously looks into the kirk to see the dance there. He is at once recognized. The whole crew chase him at furious speed till he arrives at the bridge over the River Doon. No witch could cross a running stream. Tom therefore escapes, but his old nag loses a considerable part of her tail in the hands of a witch.

Tanglewood Tales by Hawthorne, 1853, borrow some of the old classical stories and adapt them to young readers. He invests them all with his own peculiar charm of human appeal. Some of the best tales are those of the Minotaur of Circe, which turned men into pigs and was finally slain by Theseus, and of Jason and his companions who made a journey in quest of the Golden Fleece.

Tempest, The, by Shakespeare begins with a storm but ends with a decided romantic calm. It is one of the plays of his last period, when his view of life was kindly and most poetic. Though charming in many details, the plot is frankly that of a fairy story. A generous old magician, Prospero, with his daughter has been cast upon an island far from their realm, from which Prospero has been expelled by a brother, who usurped his throne. On the island are various creatures, chief of which are Caliban, a brutish half-man, who acts as servant to Prospero in doing rude tasks, and Ariel, who is servant in doing the lightsome tasks of the air. The ignoble duke and his party are cast upon the island by a storm. Prospero plays a number of practical jokes on different members of the party, through Ariel, and at last reveals himself to his astonished brother. The latter is willing to acknowledge that he has been punished enough and greatly wishes to restore to Prospero all his rights that he had usurped. For slightness of the plot, Shakespeare compensates with delightful play and kindly sentiment.

Thanatopsis, a didactic poem by William Cullen Bryant in noble blank verse, counsels us in regard to life and death.

Tinturn Abbey was written by William Wordsworth after he and some friends had taken a walk to the banks of the Wye. It contains some of his best blank verse, nature descriptions, and serious thoughts on life, and also illustrates his poetic creed in that the poem expresses "emotion recollected in tranquillity."

Tom Brown's School Days appeals to every red-blooded youth in his school age. This novel by Thomas Hughes explains how a young boy rose through the various "forms" or grades at Rugby, the famous English preparatory school, and finally attained fame at Oxford. For manliness, good nature, and sympathy with young life, this book has long been a classic in English literature. Some of the parts, like the bullying of Tom by older boys, the football match, and the boat race, never fail to charm all readers. There is also a fine portrait of Dr. Thomas Arnold, the great headmaster of Rugby for years.

Tom Jones has often been called the greatest realistic novel in our language. Henry Fielding, the author, admitted in the preface that this story contains no real hero, in the conventional sense, because Tom has numerous faults. Fielding was dissatisfied with the fine pictures of men in novels, which, in great degree, he said were quite untrue to life. Tom has many faults, but also several redeeming qualities, such as generosity, truthfulness, and a strong sympathy for right conduct. He is a foundling, brought up by Mr. Allworthy (as noble as his name intimates), and early in life he falls in love with Sophia Western, daughter of a neighboring squire. Both his guardian and Mr. Western object to the marriage, since Tom is thought to be too reckless and headstrong. In company with a tutor, who is a lovable, hearty man, Tom sets out to travel a bit about England. Before he returns he has covered many towns and has fallen into numerous adventures, some of which are not to his credit. His guardian and Squire Western at last overtake him and persuade him to return. Tom eventually marries Sophia. Two other characters drawn with great realism are Squire Western, an ignorant, blustering country squire and Blifil, foster brother of Tom's, who succeeds for a long time in deceiving Mr. Allworthy by his own hypocrisy and false reports of Tom.

Tom Sawyer is another boy's classic among our novels. Mark Twain (Samuel L. Clemens) in this has revived many of his boyhood days along the Mississippi River. Of all active boys in stories, Tom is one of the most interesting. His clever ruses are often laughable, as his plan to get the fence whitewashed by making out to his companions that the job was highly desirable, and even worth money for the privilege of attempting. Tom and Huck Finn, his less fortunate friend, survive many daring experiences, such as their visit to a cave not often explored by men.

Travels with a Donkey by R. L. Stevenson. See *The Inland Voyage.*

Treasure Island by Robert Louis Stevenson, 1883, is a fascinating adventure romance. Jim Hawkins, the youthful hero, is the son of an English tavern keeper, who inherits the plan and a map of some buried treasure from an old seaman, who finally dies at the inn. The landlord and his friends fit up a vessel, but some desperate men, learning of the venture, enlist among the crew and bring about a mutiny after the boat is well out at sea. Stevenson has painted several desperate characters with life-like realism. Long John Silver, the cook with one leg, is the arch conspirator and greatest villain. Considerable blood is spilled in various hair-raising adventures, much in the manner of the blood-and-thunder novels. Throughout, however, the story is so well written as to be in a class almost by itself among the stories of breathless interest. At last the treasure is found, Jim Hawkins comes into his own and returns safely to his native land, and the guilty are punished as they deserve.

Twice Told Tales by Hawthorne. See *Mosses from an Old Manse.*

Two Years Before the Mast tells with truthful details the story of a voyage around Cape Horn to California in early days before the rush for gold in the West. It was published first in 1837, but a supplementary chapter was added in 1869. The joys, hardships, and brutalities are told in a way to win this novel a place along with *Roderick Random, The Pilot, Mr. Midshipman Easy,* and other celebrated tales of seafaring life. William Cullen Bryant, who secured the publication for Dana, pronounced the narrative equal to *Robinson Crusoe,* for interest and realism of details. This book was chosen by the British Board of Admiralty for distribution among all sailors of the English fleets. The author was a young Harvard graduate in search of health while he shipped as a common sailor before the mast. When he reached California, he left the original sailing vessel, spent some time as a trapper in the southern part of the territory, and later returned on another craft to the shores of the Atlantic.

Uncle Remus is the old colored man reputed to be the teller of various folk lore stories as written by Joel Chandler Harris. They have all the imagination, sympathy, and drollery of the negro dialect narratives. Uncle Remus usually has a little boy as his auditor, who listens and also asks questions while the ex-slave entertains him with accounts of Brer Rabbit, Brer Fox, and other animal creatures. Some of the stories in plot and moral resemble ancient narratives found in early fables. Many of them were collected by Mr. Harris from old legends and tales handed down from generation to generation among the colored folk of the South. Stories like *Brer Rabbit's Cradle, The Wonderful Tar Baby,* and *How Mr. Rabbit was too Sharp for Mr. Fox* are typical.

Vanity Fair, the masterpiece of William M. Thackeray, has been classed among the eminent novels that describe society in its varied aspects. The chief woman character is Becky Sharp, another Beatrix Esmond, or the kind of adventuresome woman found in several of the novels by the same author. Becky is resourceful, captivating, and thoroughly unprincipled in her numerous flirtations. She is shown gradually acquiring her subtle arts from the time she throws Dr. Johnson's *Dictionary* out of the window of the coach as she leaves school for the last time. Contrasted with her is poor Amelia Sedley, a pliable, faithful, and long-suffering wife of a nondescript husband. When one resigns, the other designs further conquests. Among the fine descriptions in the novel are those of various characters of the Sedley family, the battle of Waterloo, and the various schemes of Becky Sharp. All is mellowed by Thackeray's kindly but incisive satire, while no corner of society or no foible of human nature seems to escape his notice.

Vicar of Wakefield, The, one of the pleasantest books in literature, is a hearty tribute to human nature at its best. Goldsmith, the author, pictures the idyllic life and sentiments of an English vicar,—three men in one, "vicar, husbandman, and father of a family." Dr. Primrose is a modern Job: he loses his small property, his house by fire, and his daughter through a neighboring squire of doubtful character, but always maintains his calm and simple philosophy. Some of the outlines of the picture are probably borrowed from the traits of Goldsmith himself. Mrs. Primrose is trying to appear

genteel, takes great pride in her housekeeping, and often distresses the kindly husband with her worldly ideas. Peace, good luck, and happiness are at last restored through Sir William Thornhill, who marries one of the daughters, makes his nephew, who eloped with the other, behave himself like a gentleman, and builds up the family fortunes once more, securing the release of the vicar and his sons from the debtor's prison.

Vision of Sir Launfal, a beautiful poem by Lowell, tells the story of a knight who seeks a great adventure but, for a time, misses simple charity and christian kindness near at home. Only when his love and real humanity go out toward the beggar to whom he throws a crust does the face of the mendicant change to that of Christ.

Walden, a prose work by Henry D. Thoreau, still retains its interest after seventy years since publication. Thoreau built himself a hut, lived most humbly on the shores of Walden Pond, entertained callers, and watched the birds and animals in their native pursuits. His book makes all those simple events human and fascinative to lovers of nature.

Wandering Willie's Tale is one of five or six short narratives written by Sir Walter Scott. Steven or Steenie Stevenson, a poor tenant of the old lord Redgauntlet, by dint of borrowing scrapes enough money together to pay his rent. The violent old landlord, whom everybody fears, is seized by a paroxysm before he makes out a proper receipt after he receives the money from Steenie. From this attack, the old lord never recovers. Steenie rushes out, the money is lost sight of, and the new landlord demands either the receipt or the money. While Steenie is going home one evening, a strange black man meets him in the forest, offers to assist in finding the paper, and at last leads the astonished tenant into another world, where old Redgauntlet is found among his violent boon companions. By refusing to touch or taste anything, and only to demand his own receipt, he succeeds in getting the paper and returning to the outer world. The young son of the old laird accepts the receipt, but cautions Steenie not to tell of his adventure to any man. Scott adds some humorous touches to the story and introduces us to a racy and typical Scotch dialect.

Webster-Hayne Debate consists of speeches delivered in the United States Senate in 1830 by Daniel Webster and Robert Y. Hayne. Though the discussion arose out of a plan of dividing the public domain in certain western states, it grew into a somewhat broader discussion of the conflicting notions of North and South over the question of the extension of slavery into new states. Healy's celebrated painting to represent the audience at the time now hangs in Fanuel Hall in Boston.

Westward Ho, published by Charles Kingsley in 1855, glorifies the mariners of the age of Queen Elizabeth in England. Both real and fictitious persons are found in the novel. Sir Walter Raleigh, Francis Drake, Sir John Oxenham, Richard Grenvil, and Edmund Spenser appear among the historical persons. The real hero is Amyas Leigh, a lad who goes on several expeditions with famous mariners, one with Drake around the world, twice to South America, and to other places. One voyage is made to find Rose Salterne, an old friend of the Leigh family, now married to a Spaniard. The fight of Grenvil in the Atlantic, the defeat of the Spanish Armada, and the voyages to South America in quest of gold and revenge are described with lifelike color. In the background is always the idea of the maritime glory of England about 1600. Kingsley also wove into the story a romantic love plot.

Window in Thrums is one of the best examples of humor and pathos as combined by the Scotch author, James M. Barrie. In a series of intimate pictures of a simple Scots family in a mill town, the author reveals the heroism, kindliness, and nobility of humble folk. Jess, the cheerful shut-in, Jamie and Leeby, brother and sister, are friends that remain long in memory.

Wuthering Heights, a romantic tragedy in novel form by Emily Bronte, was first issued in 1848. Indeed the subject is dark and sometimes depressing for the book contains a vivid picture of hate and human retribution, with many touches of deep melancholy and pathos. Two families intermarry, but the almost devilish hatred of one man keeps several from enjoying any peace or happiness. At the end only two of the chief characters are left to enjoy their remaining days in kindness.

Youth, one of the many fascinating sea tales by Joseph Conrad, is an account of a voyage made by a young man in an old unseaworthy sailing craft. Contrasted with the age of the vessel is the inexperience of the boy just shipping on his first voyage. A cargo is being carried from England to Bangkok, Siam. Much of the narrative describes various means of combating a fire which breaks out while the ship is in mid-ocean. When Bangkok is practically in sight, the signal to abandon the ship is given, and the crew escapes through the kindness of another boat.

LITERARY TERMS AND DEFINITIONS.

Acrostic, a verse or set of verses in which the initial letters, taken in succession, form a word, phrase, or sentence. Sir John Davies, for example, wrote twenty-six poems, each one forming in its first letters the words *Elisabetha Regina*, Elizabeth, Queen. The form is very ancient.

Age of prose and reason is a phrase often used to characterize the period roughly from 1700 to 1750, when little poetry was written, and imagination and originality gave way to conversation and taste.

Allegory is a literary or artistic work in which a hidden meaning or likeness to some other subject, thought, person is intended. It has been called an extended metaphor. Some allegories in English literature are *Piers Plowman, Faerie Queen, Pilgrim's Progress.*

Anagram is a transposition of the words or letters of a phrase or word to make a new combination that has some related meaning. Like the acrostic it is an ancient device, and once highly regarded; but Addison once said it would be hard to discover which was "the greater blockhead," the man who invented the acrostic or the one who invented the anagram.

Apocalypse literally means a revelation, like the last book of the *Bible*. Many Hebrew writings, including certain parts of Isaiah, Ezekiel, and Daniel, are apocalyptic.

Apocrypha originally meant those books in Hebrew not considered genuine scriptures. Later it meant those books in the Greek and Latin manuscripts, but not in the Hebrew. Both Old and New Testaments have corresponding apocrypha, once printed in old Bibles, and now only in a separate volume. Anything not now thought genuine is called an apocrypha, as the Shakespeare Apocrypha, sixteen plays once ascribed to Shakespeare, but now known to be not wholly his work.

Apologetics are works written or spoken in defense of the Christian faith.

Apologue, a story resembling a fable, in which a moral truth is shown without direct mention. Many Middle Age stories took this form, as do some of the narratives of Hawthorne like *The Ambitious Guest*, in which the lesson intimated is one of the futility of earthly ambition, or in some of Kipling's stories like *.007*, and *The Walking Delegate*. Of late there has been a decided tendency to revive this form, as in some of the dramas of the Irish National Theatre.

Archaism is a word or expression out of date at the time it is used, as *yclept* for called, *whilom*, and similar words in poetry.

Assonance, a middle rime of vowel sounds, corresponding to regular or end rime, or initial or alliterative rime. *Shore* and *force*, *vast* and *waste* show assonance of the *o* and the *a* sounds respectively. Tennyson gives us many lines, like "The *bare black cliff clanged* round him."

Ballad is a narrative, poetical composition usually in irregular meter, vivid, spontaneous, and objective. All European literatures have these popular poems, commonly handed down by oral tradition. Whether they are communal and social in origin or individual is still debated. The English and Scottish popular ballads are celebrated for simple and rapid movements.

Bibliography is a list of the titles of books or other material bearing on a common subject. It is fast becoming a science almost in itself. A bibliography on Immigration would list all books and magazine articles one could find bearing on the general topic.

Climax, as a figure of speech, is an increasing emphasis on an ascending series of words, phrases, or ideas. In the study of the novel and the drama, however, it means the highest point of interest, the turning point of the

action, or the moment of intensest interest when something happens to change the course of the plot. After the climax comes the resolution or final clearing up of the story or action. In a play the climax usually comes before the end of the fourth act. Climax must not be confused with culmination or end of the plot or story.

Comedy once was said to be the form of drama that ridiculed the common man, while tragedy pictured the sufferings of the noble. Modern criticism confines the name to a play with a fortunate, happy, or pleasant turn of events, all of which are well foreshadowed from the start. Some plays begin as if they were to end in tragedy, then turn into comedies; and these are often named tragi-comedies, of which *The Merchant of Venice* is a good example in Shakespeare.

Criticism is judging the merits and defects of a work of art, be it painting, sculpture, or literature. Though somewhat formless in principles, it never should depend on caprice or mere personal liking, or on considerations outside the work being examined. For the average reader a good book on the subject is Winchester's *Principles of Literary Criticism,* or Shuman's *How to Judge a Book.*

Cycle in literature is a group of poems or prose works bearing on the same general topic, but written by different authors, at different times; or several poems, which have been fused into one related whole, the parts being somewhat individual. The *Niebenlungen Lied* is the great German cycle; the Charlemagne poems, the French; and the Arthur stories, the English.

Denoument is a French word, adopted into English, meaning the final stage of the unraveling of the complication of a plot, or the clearing up of the story after the climax has been reached. Another name is Resolution to explain approximately the same part. See *climax* above.

Drama is that form of art which shows persons as if in real life,—planning, thinking, and doing. For the various kinds of early dramas before Shakespeare's age, see the section on Language in this book. These include Miracle and Moral plays and Interludes.

Dramatic Unities are three in number in classical and later French plays. They are the unities of time, place, and action. All the action should occur within the space of a day or a little more, in the same general locality or city, and the characters should be consistent in what they do,—or, otherwise, "consistently inconsistent" as Aristotle said. In English the third unity is the only one rigidly followed. Some French dramatists added a fourth, the unity of style,—each play must be all tragic, or comic, or lyric, etc. Shakespeare consistently violated this canon in his alternation of grave and gay scenes.

Elegy is a lyric form of poem dealing with thoughts of melancholy or death that are real or imaginary. Milton, Gray, and Arnold wrote beautiful elegies, now justly famous. Tennyson's *In Memoriam* is a fine elegy.

Epic poetry. See section on Language in this book.

Essays in literature are discussions of topics in either a formal or informal manner. Montaigne, a French author in 1580, published his *Essais,* and he was followed in English by Bacon. Some attempt has been made to divide essays into two classes, scientific and familiar, but one class often overlaps upon the other. Cowley, Dryden, Addison, Johnson, Burke, Hazlitt, DeQuincey, Lamb, Emerson, Carlyle, Walter Pater, Macaulay, Bagehot, and Stevenson are some of the great English essayists.

Fables are now defined as stories with moral implications in which men are represented usually by animals and even inanimate objects like trees. Fables by Aesop, La Fontaine, Anderson, Grimm Brothers, and Joel Chandler Harris are among the best known in English, but the form is ancient and the literature is prolific. Once the word fable was used for story, plot, or deeper significance of a literary work. Dryden uses the word often in this secondary sense.

Fabliaux were groups of entertaining verse compositions of satirical and comic interest. They were often quite realistic and first became known in French literature in the middle periods.

Fallacy is often spoken of as a mistake in thought or some wrong opinion. In logic a fallacy is a mistake in reasoning from premise to conclusion. The kinds of fallacies are numerous and hard to distinguish, but the most common ones are hasty generalization, fallacy of mistaking an effect or a cause, if one is known and the other to be found, wrong analogy, arguing in a circle, and shifting ground by taking different positions in successive parts of an argument.

Farce is a variety of comic drama that is designed wholly to please. It has been defined as "improbable people doing impossible things." In a farce there is little attempt to present people or events in their true light. Many farces are accompanied by horse play or crude practical jokes.

Fiction, in its widest sense, is opposed to reality and fact. In a literary work it designates an imaginative composition, some parts of which may be based on reality. Though fiction is found in both poetry and prose, the word is popularly used to designate a prose story, novel or romance, short or long. See *novel* and *romance.*

Folio in printing is a sheet, approximately 17 by 22 inches, that is folded twice only; hence, a book of largest size, as distinguished from quartos, duodecimos, etc. In books used for keeping accounts, a folio is a single sheet thus folded, or two,—right and left hand,—numbered alike, and used for debtor and creditor sides of a ledger.

Free verse, a popular form of unrimed poetry, at present designated by considerable irregularities in metrical form, length of line, and other variations from conventional, regular poetry. Authors of free verse profess to depend more on beauty or nobility of thought than on metrical and musical graces.

Idyll is a poem in simple diction treating usually of rustic or pastoral themes. Some idylls are lyric poems in praise of nature; others are narrative or descriptive, with persons and emotions brought into the foreground. Tennyson's *Dora* and *The Gardner's Daughter* are true idylls, but his *Idylls of the King* are too ornate and artistic to be more than idylls in name.

Laureate as a name originated in the ancient classical custom of crowning with laurel a famous poet, or the victor in a literary contest. Chaucer was granted a pension in England and wrote court poems, as succeeding poets did, but the office of poet laureate was not formally established till it was given to Dryden by letters-patent in 1670. Of the numerous laureates since the eighteenth century, Southey, Wordsworth, and Tennyson are best remembered.

Lyric poetry expresses emotions, real or assumed, of the author himself. Epic poetry is almost wholly objective, and dramatic has been called a combination of the other two forms. See the article on *Prosody* in the section entitled *Language* in this book.

Masque is the name applied to a light, musical, allegorical play as represented in amateur theatres. In the age of James I the court allegory in masque form attained great vogue. With the rise of spectacular and musical or ballad operas, the form declined greatly. One of the celebrated masques in English is Milton's *Comus;* others were more imaginative and gay.

Melodrama flourished in France long before it was introduced into England by Thomas Holcroft about 1800. At first the name was applied only to a musical and spectacular play, full of peculiar and sudden effects. At present the word is usually applied to any play of strong situations, unmotived action, and startling changes of fortune. When the novels of Walter Scott were transferred to the stage shortly after 1815, melodrama drew largely on such prose romances for subjects. The songs, scenery, and highly emotional acting characterized such plays for a quarter of a century.

Meter and various verse forms are discussed in the section on *Prosody* elsewhere in this volume.

Metrical Romances grew up in the centuries at the end of the Middle Age in English literature. The long poems of Scott revived some of the main characteristics of the type. These really are novels or at least short stories in verse. They are notable for action, swift description, and strong pictures of people.

Mixed Metaphors are incongruous assortments of words and rhetorical figures of likeness. "I smell a rat, I see him floating in the air, I'll nip him in the bud" has been given as a sample of mixed metaphors from the halls of Parliament. The best metaphors are those that might be taken literally, without too much violence to reason or sense.

Novel, as a general term, is applied to all long prose fictions. In the narrow sense, the class falls into two divisions, novels proper and romances. In novels the story and characterizations follow human nature and actual or possible facts; in romances the persons are likely to be ideal and the events not probable to the same degree as they are in novels. Scott and Hawthorne are romancers, for instance; while George Eliot and Dickens are novelists.

Panegyric is an oration or prose writing that extols some person, event, or principle. Recently, however, the word has been broadened to include any laudatory account.

Pastoral poetry and drama show a real or ideal life in the country. Most of our pastorals in English literature are highly artificial, and written by men who lived in towns and knew the rural districts only at second hand. Men like Barnes, William Browne, and James Hogg, the Ettrick shepherd, approach toward reality in pastorals. Prose fiction, too, often has pastoral elements like Sidney's *Arcadia*, or the Spanish pastoral romances like the *Diana* of Montemayor. Shepherds named Lycidas, Corydon, Daphnis, Chloe, Amaryllis appear in all pastorals since Theocritus, a Latin poet who lived three hundred years before Christ. Some of the fanciful pastorals in English are Spenser's *Shepherds Calendar*, Lodge's *Rosalynde*, in prose, from which Shakespeare got suggestions for his *As You Like It*, Jonson's dramatic *Sad Shepherd*, and Fletcher's *Faithful Shepherdess*, a romantic play. Pope, Ambrose Phillips, Gay, and Ramsey all wrote pastoral verses. Cowper, Wordsworth, and Tennyson in a few poems, wrote pastorals without much of the artificial elements. Elegies like Milton's *Lycidas*, Arnold's *Thyrsis*, and Shelley's *Adonais* are strongly marked by pastoral touches.

Poetry, its forms, and kinds are treated under *Prosody* on another page.

Polyglot strictly speaking is a book with several versions of the text in different languages printed side by each or in succession. Now the word is often used of many languages in general; or, a person who speaks several has been called a polyglot.

Realism as opposed to idealism more nearly approaches to realities, facts, events, and people as they actually exist in this world. Thus, the novel is realistic in that it closely simulates actual life and conditions that are probable. Whether the story is true or not is immaterial, so long as it might be true to human life and nature.

Refrain is the repetition of the same words, lines, exactly or approximately, from time to time in a poem. One form is the chorus in which all the hearers supposedly join with a soloist or reciter. Certain French stanza forms use beautiful refrains. The good refrain must seem spontaneous and musical.

Rhapsodists once in Greece wandered about singing their own poems. Later reciters use the works of others; and still later music was not used as an accompaniment. The word means literally, recital of poetry. In England the Anglo-Saxon scop was a reciting wanderer. So were the Welsh bards, the medieval minstrels. The minnie singers in Italy made popular modern romantic poetry. Probably the older ballads were sung by wandering bards.

Riddles, conundrums, and enigmas are ancient forms of entertainment. Samson propounded a celebrated riddle to the Philistines. Solomon and Hiram King of Tyre engaged in a guessing match with forfeits for not being able to guess the riddle. The Greek sphinx made riddles, and the sphinx of Thebes devoured those not able to solve them. In modern times the riddle has branched off into detective stories and simple stories with mysteries left unsolved at the end. Some of the oldest poems in English are in riddle form.

Runes are characters formed by arranging straight lines in various positions. Runic inscriptions are found in most of the countries of the north and west of Europe.

Satire attacks men, actions, and beliefs. It is an old form of the literature of criticism. Some of the old fables satirized the king, but were safe in that animals were the actors and doers. English satire dates from the time of Chaucer, whose writings have many sly hints and jokes of satirical import. Pope, Dryden, and other authors of the age between 1660 and 1800, developed satire to its highest point of perfection. For virulence Pope and Swift excell other satirists.

Short Story in its artistic form is not any narrative that happens to be short. Poe first gave us the theory of the short story, as a narrative to be read in one sitting, that rises from a beginning through a climax, to a swift and inevitable end. Poe says not a single word should be wasted in description or extraneous details. Unity of plot and unity of action are the chief marks of good short stories. As compared with the novel, the short story is just as complete in its own range, since nothing could be added, and nothing could be subtracted. In no sense, then, is a perfect short story a condensation. The novel is composed of many episodes, turns in character, and shifts of scene. The short story cannot afford to depart much from a straight line of plot or action.

Stanza is a group of lines or verses in a poem, a minor division of the whole. Incorrectly verse is often confused with stanza, but in reality, a verse is but a single line, a stanza a combination of two or more lines.

Tragedy is a form of literary art that shows how inevitable forces work to an end that is distressing or sad. A tragedy ends in defeat, misunderstanding, disaster, or even in death, but the last is not the main feature of a tragic story or drama. French classic tragedies are serious throughout; English, as imitating Shakespeare, sometimes have humorous or comic scenes in tragedies. Usually tragic emotions are those on a high plane, and the characters suffer nobly or with much strength of character, whether it be good or bad.

Tragi-comedy, a serious play that finally ends fortunately or happily. The dramas of Beaumont and Fletcher are good illustrations.

Verse, a single line of poetry, not a stanza or group of lines. Various English verse forms are described in the section on *Language*.

USEFUL BOOKS FOR THE STUDY OF ENGLISH.

A list of titles of useful books is given below to supplement the outlines and the discussion of English classics in the preceding pages. Those who wish to carry their studies in English further will find most of these books in any good library. Care has been taken to select only those texts best suited to the general reader. Prices are subject to some revisions.

Alden, Raymond M. "Introduction to Poetry." Holt, 1.50

Baker, Harry T. "The Contemporary Short Story." Heath, 1.50

Bates, Arlo. "Talks on the Study of Literature." Houghton, 1.50

Bennett, Arnold. "Literary Taste and How to Form It." Doran, 1.00

Brown, Rollo W. "How the French Boy Learns to Write." Harv. Univ. Press, 1.50

Ward, A. W., editor. "Cambridge History of English Literature." 14 vols. Putnams, each 3.50

White, H. A. "English Study and English Writing." Heath, 1.50

Woodberry, George E. "The Appreciation of Literature." Harcourt, 1.20

GRADED LIST OF TWO HUNDRED BEST BOOKS FOR CHILDREN

For home and supplementary school reading, grades one to eight inclusive, based on the experience and recommendations of the Carnegie Library of Pittsburgh, the Buffalo Public Library, and the Wisconsin Free Library Commission.

Thoughtful parents are constantly confronted with the problem of selecting the right books for their children. To aid in performing this important task, the following list has been prepared with extreme care, making use of the experience of several great libraries which have co-operated with parents and teachers for many years, as well as that of many teachers and library workers who have specialized upon the problem.

Object of List.—In order to make this list as valuable and useful as possible, three definite aims have been kept in view:—

First: To make a practical list of books, any one of which will be suitable for first purchase for the home, school, or community library.

Second: To include only books which the widest use has proved of greatest value.

Third: To include only books easily obtainable, giving publishers and price. More expensive editions of many of the books here listed are published, and, in a number of cases, less expensive ones also. But parents not infrequently make the mistake of buying children's books in too small type or so poorly illustrated or bound that their usefulness is annulled. In making this list the lowest-priced edition consistent with satisfactory service after purchase has been selected.

Method of Grading.—Many extremely helpful children's books are almost equally valuable for two or more grades. In order to prevent confusion and to avoid repeating the name of the same book under two or more grades, each book is listed under the earliest grade for which it is recommended. In a limited number of cases in the two highest grades, books are listed where the majority of authorities place them. In practice nearly all books in the list will be found almost equally suitable for children one or two grades more advanced. This overlapping of limits is so extensive in the sixth, seventh, and eighth grades that excellent authorities are inclined to place the books best adapted for them in one general group. However, even if some children in the sixth grade are capable of reading with profit books here listed under grade eight, they will do so with far greater benefit if they read those listed under grades six and seven first, and this list will prove of great value in indicating the order in which these books should be read. More advanced books will be needed on subjects about which a child's interest is keenest, a point to be kept in mind in making selections.

Since book prices at present are subject to some fluctuations, it is best to have your local bookseller consult his current catalog of published books to ascertain if any change has been made. Otherwise, you may communicate directly with the publisher or with any jobber or wholesaler of books.

FIRST GRADE

Blake, D. K., and **Alexander, Georgia**, compilers. "Graded Poetry Readers." First and second year. Merrill, .20

Burgess, T. W. "Old Mother West Wind." Little, .45

Coe, Ida, and **Christie, A. J.** "Story Hour Readers." First year, 2 vols. Am. Book, each .30

Cox, Palmer. "Brownies: Their Book." Century, 1.50

Dodge, Mrs. M., compiler. "New Baby World." Stories, pictures, and rhymes selected from St. Nicholas. Century, 1.50

Gaynor, Mrs. J. L. "Songs of the Child World," 2 vols. Church, each, 1.00

Greenaway, Kate. "Under the Window." Warne, 1.50

Grimm, J. L. and **W. K.** "Fairy Tales." Edited by S. E. Wiltse. 2 vols. Ginn, each, .35

Grover, E. O. "Overall Boys." Rand, .45

Grover, E. O. "Sunbonnet Babies' Primer." Rand, .40

Holbrook, Florence. "Hiawatha Primer." Houghton, .40

Ivimey, J. W. "Complete Version of Ye Three Blind Mice." Warne, .50

Lansing, M. F. "Rhymes and Stories." Well chosen nursery rhymes, nonsense tales, and folklore. Ginn, .45

Mother Goose. "Book of Nursery Rhymes." Arranged by Charles Welch. Heath, .30

Mother Goose. "Jolly Mother Goose Annual." Illustrated by B. F. Wright. Rand, 1.35

Mother Goose. "Our Nursery Rhymes." The original tunes harmonized by Alfred Moffat; illustrated by H. W. Le Mair. McKay, 1.50

Mott, S. M., and **Chubb, Percival.** "Indoors and Out." Nature and dramatic reader for primary grades. Scribner, .30

Norton, C. E., editor. "Heart of Oak Books," Vol. 1. Rhymes, jingles, and fables. Heath, .25

O'Shea, M. V., editor. "Six Nursery Classics." Contains The House that Jack Built, Mother Hubbard and Her Dog, Courtship of Cock Robin, Dame Wiggins of Lea, The Old Woman and Her Pig, and The Three Bears. Heath, .20

Parkinson, Ethel. "Dutchie Doings." Dodge, 1.00

Scudder, H. E., editor. "Book of Fables and Folk Stories." Houghton, .40

Van Sickle, J. H., and others, editors. "Riverside Readers." Houghton, Primer, .30; First Reader, .35

Wiltse, S. E. "Folk Stories and Proverbs." Well told and well illustrated with simple drawings. Ginn, .30

SECOND GRADE

Adelbourg, Ottilia. "Clean Peter and the Children of Grubbylea." Longmans, 1.25

Andersen, H. C. "Fairy Tales." Selected and edited by E. H. L. Turpin. Merrill, .40

Baldwin, James. "Fairy Reader." Adapted from Andersen and Grimm. Am. Book, .35

Baldwin, James. "Fairy Stories and Fables." Am. Book, .35

Bass, M. F. "Nature Stories for Young Readers: Animal Life." Heath, .35

Bass, M. F. "Nature Stories for Young Readers: Plant Life." Heath, .25

Beard, Lina and **A. B.** "Little Folks' Handy Book." Scribner, .75

Brooke, L. L. "Golden Goose Book," 4 pts.—Golden Goose, Three Bears, Three Little Pigs, Tom Thumb. Warne, 2.00

Caldecott, Randolph. Picture Books. 4 vols.
No. 1, "Diverting History of John Gilpin." "Three Jovial Huntsmen." "An Elegy on the Death of a Mad Dog."
No. 2, "The House that Jack Built." "Song of Sixpence." "The Queen of Hearts."
No. 3, "Hey Diddle Diddle." "Baby Bunting." "Ride a Cock Horse." "Where are you Going, My Pretty Maid." "The Frog he would A-wooing Go."
No. 4, "Come, Lassies and Lads." "The Fox Jumps Over the Parson's Gate." "Mrs. Mary Blaize." "The Great Panjandrum Himself." Warne, each vol., 1.25

Chance, L. M. "Little Folks of Many Lands." Ginn, .45

Coe, Ida, and **Christie, A. J.** "Story Hour Readers." Second year. Am. Book, .35

Grover, E. O., and **Chutter, F. E.** "Art Literature Readers." "Each contains about 40 excellent reproductions of paintings, well chosen. The easy text, original or selected, fits the picture."—N. Y. Lib. Best Books. Atkinson, Book 1, .30; Book 2, .40

Jataka. "Jataka Tales." Edited by E. C. Babbitt. Century, .40

Johnson, E. L., and **Barnum, M. D.** "Book of Plays for Little Actors." Am. Book, .30

Mott, S. M., and **Dunton, M. B.** "Fishing and Hunting." (World at Work Series.) Stories of the Eskimos, Indians, Alaska, and the Philippine Islands. Am. Book, .30

Norton, C. E., editor. "Heart of Oak Books." Vol. 2. Fables and nursery tales. Heath, .25

Perkins, Mrs. L. "Dutch Twins." Everyday life of a Dutch brother and sister. Houghton, .50

Stevenson, R. L. "Child's Garden of Verses." Rand, .75

Van Sickle, J. H., and others, editors. "Riverside Readers." Second reader. Houghton, .40

THIRD GRADE

Æsop. "Child's Version of Æsop's Fables." With a supplement from La Fontaine and Krilof. Edited by J. H. Stickney. Ginn, .35

Andrews, Jane. "Seven Little Sisters Who Live on the Round Ball that Floats in the Air." Ginn, .50

Baldwin, James. "Fifty Famous Stories Retold." Am. Book, .35

Blake, D. K., and Alexander, Georgia, compilers. "Graded Poetry Readers." Third year. Merrill, .20

Carroll, Lewis. "Alice's Adventures in Wonderland," with 42 illustrations by Sir John Tenniel. Macmillan, 75

Coe, Ida, and Christie, A. J. "Story Hour Readers." Third year. Am. Book, .35

Eggleston, Edward. "Stories of American Life and Adventure." Am. Book, .50

Eggleston, Edward. "Stories of Great Americans for Little Americans." Am. Book, .40

Field, Eugene. "Eugene Field Reader." Many poems included. Scribner, .40

Fultz, F. M. "The Fly-aways and Other Seed Travelers." Public School Pub., .60

Grimm, J. L. and J. K. "German Household Tales." Riverside School Library. Houghton, .60

Lansing, M. F., editor. "Fairy Tales," 2 vols. Ginn, each, .35

Lucia, Rose. "Stories of American Discoverers for Little Americans." Am. Book, .40

Maeterlinck, Maurice. "The Blue Bird." For children. Arranged for schools by F. O. Perkins. Silver, .68

Morley, M. W. "Bee People." McClurg, 1.10

Norton, C. E., editor. "Heart of Oak Books," Vol. 3. Fairy tales, narratives, poems. Heath, .40

Shaw, E. R. "Big People and Little People of Other Lands." Describing home life, appearance, manners, and dress. Am. Book, .30

Thorne-Tomsen, Mrs. Gudrun, compiler and translator. "East o' the Sun and West o' the Moon." Norwegian folk tales. Rowe, .60

Van Sickle, J. H., and others, editors. "Riverside Readers." Third reader. Houghton, .50

Wilson, G. L. "Myths of the Red Children." Folk-lore stories with description of the Indian implements. Ginn, .45

FOURTH GRADE

Aanrud, Hans. "Lisbeth Longfrock." Translated from the Norwegian by L. E. Poulsson. Ginn, .40

Andersen, H. C. "Stories." (Riverside Literature Series.) Houghton, .40
Also Everyman's Library. Dutton, .50

Atkinson, G. F. "First Studies of Plant Life." Ginn, .60

Bailey, C. S. "Children's Book of Games and Parties." Donohue, 1.00

Bible. "Bible for Young People," arranged from the King James version by Mrs. J. B. Gilder. Century, 1.50

Blake, D. K., and Alexander, Georgia, compilers. "Graded Poetry Readers." Fourth year. Merrill, .20

Brown, A. F. "In the Days of Giants." A book of Norse tales. Houghton, .50

Chamberlain, J. F. "How We are Sheltered." A geographical reader. Macmillan, .40

Craik, Mrs. D. M. "Little Lame Prince." Heath, .30

Jenks, A. E. "Childhood of Jishib the Ojibwa." Reveals the real life and soul of the Indian boy. Atkinson, .35

Kaler, J. O. "Toby Tyler; or Ten Weeks with the Circus." Harper, .60

Kingsley, Charles. "Greek Heroes." Ginn, .30
Also Everyman's Library. Dutton, .50

Kingsley, Charles. "Water Babies." Dutton, .50

Kipling, Rudyard. "Just So Stories." Best when read aloud. Doubleday, 1.20

La Ramée, Louise de. "Dog of Flanders: a Christmas Story." Page, .50

Lang, Andrew, editor. "Blue Fairy Book." Standard fairy tales. Longmans, 1.00

Lang, Andrew, editor. "Red Fairy Book." Fairy tales from German, Norse, and French. Longmans, 1.00

Long, W. J. "Secrets of the Woods." Ginn, .50

Olcott, F. J., compiler. "Story-telling Poems." Houghton, 1.25

McDonald, Mrs. E. A., and Dalrymple, Julia. "Gerda in Sweden." (Little People Everywhere Series.) Little, .45

McDonald, Mrs. E. A., and Dalrymple, Julia. "Kathleen in Ireland." (Little People Everywhere Series.) Little, .45

Norton, C. E., editor. "Heart of Oak Books," Vol. 4. Fairy tales, ballads, poems. Heath, .45

Ruskin, John. "King of the Golden River." Page, .50

Schwartz, J. A. "Wilderness Babies." Little, .50

Scudder, H. E., editor. "Children's Book: a Collection of the Best and most Famous Stories in the English Language." Houghton, 2.25

Sewell, Anna. "Black Beauty." Educational Pub., 1.25

Spyri, Johanna, "Heidi." Charming story of child life in the Swiss Alps. Ginn, .40

Stein, Evaleen. "Gabriel and the Hour Book." Story of a French peasant boy who helped the monks make books in the middle ages. Page, 1.00

Stone, G. L., and Fickett, M. G. "Everyday Life in the Colonies." Heath, .35

FIFTH GRADE

Alcott, L. M. "Little Men." Little, 1.35

Alcott, L. M. "Little Women." Little, 1.35

Allen, N. B. "Industrial Studies: United States." Ginn, .65

Arabian Nights. "Arabian Nights' Entertainments;" edited by F. J. Olcott. Holt, 1.50

Barrie, J. M. "Peter Pan in Kensington Gardens." Scribner, 1.50
"Perhaps the most popular of modern fairy tales." —Coussens.

Benton, C. F. "Saturday Mornings, or, How Margaret Learned to Keep House." Estes, .75

Blaisdell, A. F., and Ball, F. K. "Hero Stories from American History." Ginn, .50

Blake, D. K., and Alexander, Georgia, compilers. "Graded Poetry Readers." Fifth year. Merrill, .20

Brooks, E. S. "True Story of Benjamin Franklin." Lothrop, 1.50

Burroughs, John. "Squirrels and Other Fur-Bearers." Houghton, .50

Carpenter, F. G. "Africa." Am. Book, .60
Geographical reader with information about the country, animals, and industries. Others in same series describe Europe, Asia, Australia, North America, and South America.

Carpenter, F. G. "Foods; or, How the World is Fed." Am. Book, .60

Carpenter, F. G. "How the World is Clothed." Am. Book, .60

Collins, F. A. "Boys' Book of Model Aeroplanes." Century, 1.20

Dickinson, A. D., and Skinner, A. M., editors. "Children's Book of Christmas Stories." Doubleday, 1.25

Dodge, Mrs. M. "Hans Brinker." Scribner, .50
Skating adventures in Holland.

Eastman, C. A. "Indian Scout Talks." Little, .80

Fraser, C. C. "Every Boy's Book of Handcraft, Sports, and Amusements." Estes, 2.00

Gilbert, Ariadne. "More Than Conquerors." Century, 1.25
Biographical sketches of Scott, Irving, Lamb, Beethoven, Emerson, Agassiz, Thackeray, Livingstone, Pasteur, Brooks, Booth, Stevenson.

Hall, A. N. "The Boy Craftsman." Lothrop, 1.60

Harris, J. C. "Uncle Remus: His Songs and Sayings." Appleton, 2.00
Containing the inimitable Brer Fox and Brer Rabbit stories.

Ingersoll, Ernest. "Book of the Ocean." Century, 1.50

Johnson, Constance. "When Mother Lets us Keep Pets." Moffat, .75

Mackay, C. D. "House of the Heart and Other Plays for Children." Ten one-act plays. Holt, 1.25

Miller, Mrs. H. M. (Olive Thorne Miller.) "First Book of Birds." Houghton, .60

Moses, Belle. "Louisa May Alcott." Appleton, 1.25
Biography for children.

Müller, Margarethe. "Elspeth." Dutton, 1.00

Norton, C. E., editor. "Heart of Oak Books," Book 5. Classic tales and masterpieces of literature. Heath, .50

Olcott, F. J., editor. "Good Stories for Great Holidays." Houghton, 2.00

Sargeant, F. C. "Corn Plants: Their Uses and Ways of Life." Houghton, .75

Seton, E. T. "Krag and Johnny Bear." Scribner, .50

Starr, Frederick. "American Indians." Heath, .45
Interesting and reliable information concerning Indians.

Starr, Frederick. "Strange Peoples." Heath, .40
Interesting and authoritative material concerning people of many lands.

Tappan, E. M. "Old Ballads in Prose." Houghton, .40

Wiggin, Mrs. K. D. "Birds' Christmas Carol." Houghton, .50

Stevenson, R. L. "Treasure Island." Grosset, .50

Toothaker, C. R., "Commercial Raw Materials." Ginn, 1.00

USEFUL BOOKS FOR MOTHERS AND TEACHERS.

This list embraces books for older persons to use with children, books to read aloud to children at home or at school, and also books from which to obtain suggestions for guiding children in their reading.

Mothers desiring to arouse the interest of children in home reading, in making things, in pictures or in nature study, will secure valuable assistance from these well tested books.

Teachers seeking readily available supplementary material of proved merit can make profitable use of the list.

Mothers and teachers engaged in promoting the mutual welfare of the home and school through co-operation in parent-teachers' associations will find the books on children's reading, story-telling, dramatics for children, plays and games, sex hygiene and citizenship, inspiring and instructive. Extensive use of the inexpensive publications issued by leading libraries, which have given special attention to this field, is recommended. Attention is also directed to the "Reading Course For Parents" conducted by the U. S. Bureau of Education, Home Education Division, Washington, D. C., which invites correspondence on the subject.

The full name and address of the publisher of each book may be found by consulting the key-list below. In case of library publications address the library direct.

Bailey, C. S. "For the Story Teller." Story telling and stories to tell. Bradley, 1.50

Boston Public Library. Finding List of Fairy Tales and Folk-stories. Published by the Library, Boston, Mass. .05

The rights of a child; children's plays, stories, playthings, kindergarten, governing children, other people's children.

GOOD BOOKS FOR A HIGH SCHOOL LIBRARY.

For convenience the list is divided into two parts, non-fiction, and short stories and novels. Literary classics, such as those studied in school or familiar to all, are not included for obvious reasons. Prices are subject to revision. In some cases only strong, library bindings are recommended; in others the cheaper ones that may be easily replaced. Many publishers have cheaper editions of some of the books suitable for individual homes, but probably not durable for large libraries. The following list is compiled from publications of many libraries, the American Library Association, Bulletin of the Illinois Teachers of English, and the elaborate list published by the Department of Interior, Bureau of Education of the United States (Bulletin, 1917, No. 41).

Addams, Jane. "Spirit of Youth and the City Streets." Macmillan, 1.25

EARLY ATTEMPTS AT HUMAN FLIGHT.

No story of the *Arabian Nights* ever was more fascinating than the history of aviation. Man wanted to imitate the birds of the air for centuries. He wished to pass quickly from place to place without wasting time in slow travel; he also craved to behold the world from above the mountains and the lakes. Early literature is replete with legends of attempts to fly. Greece, Germany, the Norseland, England—indeed almost every land has produced some myth of man's attempt to conquer the air. The account of Daedalus, that ingenious Greek craftsman, who coated wings with wax and flew from Crete to Italy may have been more than a mere poetic fancy. So also may have been the sequel, when his daring son, disregarding his father's cautions, stole the machine, flew too near the sun, and crashed into the sea when the wax of the wings melted in the heat.

Dawning history records a host of characters who tried to rise into the air by means of wings. Simon the Magician at Rome is said to have tried to please his emperor by trying to glide through the air. So the Saracen of Constantinople likewise sought the favor of his monarch, only to fall to his death. Moors, other Saracens, even a legendary Briton all tried their hand at making primitive air craft. Since so many of these initial attempts proved fatal, the Middle Ages connected them with the black art, and named Satan as the father of all who desired to fly.

The learned Friar Roger Bacon imagined it possible to "beat the air after the manner of a flying bird." In such endeavors, several early experimenters came nearer to the possibility of success than they realized. Among those workers whose attempts were more than myths are probably the monk of Malmesbury in England who imitated the wings of Daedalus in 1065; a famous mathematician who tried to devise a mechanical eagle to greet Charles V on his entry into Nuremberg; one Italian named Danti, claimed by legend to have actually floated over Lake Trasamene, only to fall ignominously in his flight over Perugia in Italy; and John Damian, a doctor of the court of James IV of Scotland, who fixed a pair of wings to himself, jumped off the castle wall at Stirling, and "brake his thighbone."

Little, however, had been accomplished, even 250 years later, in 1742, when the Marquis de Bacqueville in France fell into the Seine in trying to fly from his house to another part of Paris by strapping planes to his legs. In the meantime some celebrated mathematicians attacked the problem, including Wilkins, Hooke, and other members of the English Royal Society. Even in 1648, before the Society existed, Wilkins discussed four ways of flying, that of a "flying-chariot" only being considered possible. In all this first period, however, man was trying to steal the secret of the birds, and he failed because he overemphasized certain features of the movements of the wings. Lana and Borelli, two Italian scientists, the latter in correspondence with the English Royal Society, made many observations. Borelli concluded that man could not fly by muscular power alone. In studying the flight of birds, however, he overestimated the importance of the downward motion of the wings in keeping the bird aloft.

HISTORY OF LIGHTER-THAN-AIR CRAFT.

Next we shall deal with the development of the balloon, at first uncontrolled. In 1670 Lana suggested suspension in the air by means of four globes, from which air could be exhausted so as to cause them to bear up the weight of men. To avoid the difficulty of making the globes strong enough to withstand external pressure when exhausted of air, Dr. Joseph Black of Edinburgh suggested a century later that the globes could be inflated with hydrogen gas, later recognized as the best gas for inflation. In 1783, the Montgolfier Brothers, makers of paper in Paris, amused themselves out of business hours by constructing small paper balloons, inflating them with hot air. One, ten feet in circumference, rose to the height of over a mile and floated for a mile and a half. Next followed a grand exhibition attended by some of the court of Louis XVI, together with the monarch and his consort, when a sheep, a cock, and a duck were sent up fifteen hundred feet. On Nov. 21, 1783, de Rozier and the Marquis of Arlandes, in the first human ascent by balloon, sailed over Paris at a height of three hundred feet for more than five miles. Two years later Rozier fell to his death in trying to steer a balloon across the English Channel, shortly after Blanchard had accomplished this feat without harm. One year later, an Italian named Lunardi floated continuously for some 24 miles in England. From this time on he and others popularized the sport, so that watching the movement of balloons became a great public spectacle, witnessed even by such notables as Dr. Samuel Johnson and Horace Walpole. Using coal gas for inflation, a balloon constructed by Green and Holland in 1836 flew for more than 500 miles.

All these primitive balloons were entirely uncontrolled. Man had not learned to steer them, to fit them with a rigid frame, or to propel them. He had to depend on the movements of air currents to blow him in a desired path or direction. It was only in 1852 that Giffard, a French inventor, realized a practical dirigible balloon or airship. He built a cigar shaped airship, equipped with a 5 horse power steam engine, driving an eleven-foot propeller and attaining a speed of 6 miles per hour. He was followed by other famous Frenchmen such as Dupuy de Lome and Renard. Another great pioneer was Santos Dumont of Brazil who spent much of his private fortune in building and sailing various types of balloons, making his first flight in 1898. By Sept. 6, 1901, he was using his sixth model, which flew almost seven miles in about one-half hour. Then he made several new designs, one of which—a racing model—flew sixteen miles an hour, and was directed without mishap into the hangar, a notable accomplishment for those days. Using still a more refined type of airship, he flew one just above the crowds of the Paris streets to his home for breakfast, which he took while attendants held the balloon outside, and then returned without accident to the hangar. All the models just mentioned were semi-rigid.

Either Speiss, an Alsatian, or Count F. von Zeppelin deserves the credit for making the first rigid balloon. As variously constructed, such a craft has an outer network of steel covering the gas bag, with rubberized cotton fabric covering the framework which is constructed of duralumin. Beginning in 1873 with the first design, by the end of the century Zeppelin made a memorable flight at the rate of nearly eighteen miles an hour. Five years later, in 1905, the Z3 landed successfully with all engines dead, but the wind then caught the framework and crumpled it. In 1906, another model covered 200 miles at twenty-eight miles an hour, and this was the record to that date for this type of airship.

The first large Zeppelin of 1900, with a length of 419 feet and a diameter of 38, contained 400,000 feet of gas, and had a net lift of 4.5 tons, somewhat less than half of which was available for passengers, baggage, and freight. Before the World War commercial airships had attained a length of 459 feet, a diameter of 49, a gas capacity of 670,000 cubic feet, a useful lift of 6 and a half tons, a speed of 24 miles an hour, and a passenger capacity of 24. As early as 1911 a regular schedule of service was established, and within three years five different airships were in commission. Without a single injury, between 1911 and 1914, these Zeppelins made over 1,500 flights, lasting over 3,100 hours, covering 107,000 miles, and carrying over 34,000 passengers.

Zeppelins developed with amazing rapidity during the World War. In one year 15 ships made 400 long flights and raided England some 30 times. At one time in October, 1917, a fleet of 11 made a concerted attack on some English cities, but they were driven off and some of them were wrecked in the return voyage. The English rigid airship, the R38, fell into the Humber River with a loss of forty-four men in 1921, but the R33, also modeled from a German rigid airship, after lying idle in England for almost seven years, successfully weathered a storm for 33 hours while it was driven from Pulham to Holland in 1925. In 1917, a Zeppelin had made a non-stop return trip from Bulgaria to Khartoum in Africa, with a total weight of 55 tons, flying some 4,200 miles in 95 hours. By 1918, the total gas capacity of these airships had risen to over two and a fourth million cubic feet, while the speed rose to nearly 60 miles an hour.

Other outstanding achievements of rigid and semi-rigid airships are the flight of the Los Angeles from Friedrichshafen, Germany, to Lakehurst, New Jersey, in October, 1924, a distance of over 5,000 miles in 81 hours; the successful trip of the semi-rigid *Norge* from Spitzbergen to Point Barrow, Alaska, in May, 1926, a total of 3,200 miles before landing; and the round trip of the *Graf Zeppelin*, the 127th of the type to be built, from Germany to Lakehurst in 1928. This last, after 28 years of building Zeppelins, is the firm's greatest achievement. It is a craft 776 feet long, 100 feet in diameter, with a gas capacity of 2,750,000 cubic feet, 5 reversible 530 horse power Maybach engines, and is capable of cruising 12,600 miles with 50 aboard.

England is planning a similar airship to carry 100 passengers for 4000 miles at 75 miles an hour, using 6 Rolls-Royce Condor engines of 700 horse power each. The *Los Angeles* is now the only very large airship in the United States since the fatal accident to the sister craft, the *Shenandoah*.

GLIDERS AND THE EARLY HISTORY OF THE AIRPLANE.

Returning now to the history of the heavier-than-air machine, we find that as early as 1500, the Italian artist, Leonardo da Vinci, declared that "a bird is an instrument working in accordance with mathematical law, which instrument it is within the capacity of man to reproduce." He even touched upon subjects that are of great importance today, like the "center of resistance" and equilibrium of the center of gravity with the "center of resistance," and designed a model which actually ascended straight upward with some success. A practical helicopter, or vertically-rising plane, is still the dream of modern aeronautics.

Sir George Cayley, a great pioneer of the early part of the nineteenth century, agreed with Borelli that man is not muscular enough to propel a machine capable of bearing his own weight. Like some of his predecessors, he realized that the reaction of the air should be utilized to keep

a machine in the air. Early experimenters had thought that the flapping of birds' wings should be imitated. Cayley stated that it was necessary to have a plane surface which will "support a given weight by the application of power to the resistance of the air." Some years even before Cayley, however, a Karlsruhe architect had estimated that a machine to carry 200 pounds must have a total wing surface of about 126 square feet. It was this principle of dynamic reaction which the Wright Brothers were able to study and apply on a scientific basis nearly a century later.

John Stringfellow, with preliminary assistance from W. S. Henson and some others, possibly had, by 1848, perfected a machine of the monoplane type which actually flew when propelled by a tiny steam engine for power. The model is now in the Smithsonian Institution at Washington, D. C. It is claimed as the first self-propelled, power-driven, heavier-than-air machine.

In 1843, Henson mentioned the possibilities of heavier aircraft in a published essay, but little came of his ideas, though before his death in the United States in 1857 he studied more fully the idea of gliders. The founding, in 1866, of the Royal Aeronautical Society of Great Britain stimulated experimentation. Two years later the "exhibition" of the Society at Crystal Palace contained 77 models of engines, aeroplanes, and airships, including a triplane built by Stringfellow, which was awarded 100 pounds as a prize for the lightest engine. Francis Wenham greatly increased interest by a notable paper before the Society at its initial meeting. Passing over a number of lesser names, we find that Le Bris, Otto Lilienthal, Percy Pilcher, Lawrence Hargreaves, Clement Ader and Chanute each contributed more or less to the development of heavier-than-air craft, prior to the great work of Samuel P. Langley and the final achievement of Wilbur and Orville Wright. There is no doubt that it was experimentation with the glider which laid the basis for the modern airplanes.

Le Bris, a French sailor, like some others tried to imitate the flight of birds, taking the albatross as a special model and was probably the first man to build a successful man-carrying glider. His craft, some 32 feet long, had 220 square feet of wing surface, with an appendage or tail that could be moved by a set of pulleys and levers. On the first attempt, a man who had been holding the craft down by ropes was entangled and carried aloft several hundred feet; on the second Le Bris himself fell and broke a leg. A fellow countryman, Clement Ader, built a number of models, one of which his friends asserted flew in 1897 for 300 meters.

Now passing over some experimenters in different lands who contributed little that is essential to flying, some of the most notable names are those of Alphonse Penaud, whose merits have been overlooked by many, Otto Lilienthal, Octave Chanute, and Samuel P. Langley. Though there has been some dispute as to the value of certain features of the experiments of these four pioneers, each seems to have added either some essential theory or some practical experience.

Penaud died too early in 1880 to realize the importance of his own efforts. C. L. M. Brown, in his recent book, *The Conquest of the Air*, speaks of this Frenchman as the greatest of his own land up to the time of his death. After several interesting experiments with a helicopter, his small model airplane or "planophore" in 1871 made successful flights before witnesses of a learned aviation society. Later his design of a full-sized machine, lacking an engine, approached very nearly the correct principles of the airplane. Penaud, following Prof. Pettigrew, used the torsion of rubber bands as his motive power, in a model which looks much like the toy airplanes of today which are propelled by screw actuated by releasing a twisted rubber band. Penaud also fitted an automatic elastic rudder to his model, and this had possibilities that the fixed rudders lacked. His plane, on release, would drop about two feet and then glide along near the ground for about fifty feet.

Since 1840, inventors had known that air pressure against the wing of a machine, under certain conditions, will keep it aloft. Otto Lilienthal, however, was the earliest to demonstrate that a curved wing-surface is superior to a flat one for planes. He entered into the problem as a scientist, making an original examination of the motion of birds in flight. Lilienthal altogether made 2,000 short trips in the air before a fatal accident in 1896. He constructed a glider biplane of willow, covered with tough cotton fabric, with a wing surface of about 100 square feet. Eventually he was able to steer his craft at will by moving his body to one side or the other and forward or backward much as the bicyclist does. The inventor held himself in the machine by passing an iron bar under his armpits but he left his legs dangle freely below. Lilienthal also experimented with a horizontal plane that would stabilize his aircraft.

In England Percy Pilcher, after visiting Lilienthal, carried out many interesting gliding experiments between the years 1895 and 1899. Pilcher added a horizontal tail to Lilienthal's design and made an interesting innovation in the form of a rudimentary under carriage. In 1896, he made a perfect gliding flight of 250 yards across a valley, towed only by a light fishing line, and encouraged by this, made investigations of the possibility of applying a light internal combustion engine. However, in 1899, Pilcher made a demonstration in which a guy-wire snapped, and the machine crashed. Pilcher died on the following day without having recovered consciousness.

Octave Chanute, taking up the work about where Lilienthal left off, finally developed multiplane and biplane gliders, the latter of which he adopted as being more satisfactory. Instead of relying on the movements of the pilot, Chanute sought stability and control within the glider itself, having wing surfaces that were adjustable to assist in keeping his gliders on an even keel. He was so successful in his hundreds of gliding experiments along the sand dunes of Lake Michigan that finally he allowed interested friends to fly alone, and no accidents of note happened. Chanute himself, not convinced that his own

device was safe enough, before 1900 gave up experiments and devoted the next dozen years to helping others and to studying the problem as a scientist, and he offered valuable hints to the Wrights when he visited them during their first experiments.

Samuel P. Langley approached the subject from a technical and scientific point of view. He was more anxious to prove that an airplane could be made to work than actually to acquire the technique of flight. By use of a revolving table with a long projecting arm suspending brass plates, he showed that the faster the arm moved the less tendency the plates had to fall, till they "almost floated in the air." Thus he confirmed theories of earlier men like Cayley, Wenham, and Stringfellow.

Having demonstrated to his own satisfaction the lifting power of a plane propelled through the air, he next thought of making a power plant for his model. After studying more than thirty toy designs, all fitted with rubber bands for power like Penaud's gliders, Langley at last produced in 1896 what he chose to call an "aerodrome" fitted with a steam engine. In two flights he made 3,200 and 4,200 feet respectively, but trouble lay in the control at start and finish. Persuaded by friends and aided by a Congressional grant, Professor Langley and his chief assistant, Charles M. Manly, sought to develop an engine and a plane that would be adequate to sustained flight with passengers.

In the end their large model had a steel frame, a total weight of about 730 pounds, a wing area of about a thousand square feet, and two propellers driven by a gas engine of at least 50 horse power. On October 17 and December 8, 1903, this craft was given initial trials, but at once on both occasions trouble developed at the start, and the machine fell into the Potomac River. The Langley machine later was made to fly by Glenn H. Curtiss at Hammondsport, New York, although there is some controversy as to the changes made prior to this flight. Just nine days after the second failure of the Langley aerodrome, the Wright brothers made their successful flight at Kitty Hawk, North Carolina.

Wilbur and Orville Wright deserve the credit jointly for making a practical airplane, designing and building a suitable engine, and demonstrating certain principles of stability and control. They have the honor of first managing as pilots a machine able to rise into the air by power generated within itself, to sail forward on a level course at even speed, and finally to land without definite mishap. Nobody before them had accomplished all this successfully, and they were certainly the first men to understand the complete control of the airplane.

From the start they shared a common aim: To make scientific flight an accomplished fact. By 1901, they had reduced the problem to its three main elements: First, the construction of the right type and size of wings; second, securing adequate propulsive force; third, stability and control in flight. Wilbur Wright, the literary man of the partnership, summarized the theories and results of their experiments in a number of magazine articles and public lectures. In 1901, he said that "inability to balance and steer still confronts students of the flying problem. . . . When this one feature has been worked out, the age of flying machines will have arrived, for all other difficulties are of minor importance." From the first no students ever worked more arduously and methodically than did the Wright brothers. They read everything they could of the past efforts of inventors to fly; they studied mathematics and made elaborate calculations; they looked upon the problem, finally, as a definite one to be solved simply and once for all. Wilbur and Orville Wright combined the scientific acumen of Langley with the practical zeal of Stringfellow and Lilienthal. It was this balance between theory and common sense that solved a problem that had baffled all men before them.

From 1896 to 1901, the brothers busied themselves with study, minor experiments, and observation of wing mechanism of every type available. Thus gradually, as Wilbur Wright has told us in one of his admirable essays on aviation, they passed "from the reading to the thinking, and finally to the working stage." Greatly impressed by the fatal accidents of both Lilienthal and Pilcher, they determined above everything else to secure safety. First, they checked the data on gliding flights already on record. Chanute had used a vertical rudder in the rear of his plane, whereas the Wrights also used a horizontal control in front. This led to stabilization of the plane fore and aft, which Lilienthal's machines had lacked.

Acting on advice of the Weather Bureau, they chose Kitty Hawk, North Carolina, as a place for experiments because of the favorable currents of wind and absence of sudden squalls. The results of their first summer, in 1900, were not quite satisfactory. With a larger plane having a wing surface of 308 square feet they made a gliding flight of 300 feet in 1901. Only by working the front elevator or rudder frequently could the plane be kept in right horizontal position. After modifying the depth of the "curvature" of the wings, flights came easily to them, and control became simple even in the face of strong breezes.

During the following winter they experimented zealously with a wind tunnel constructed at their home in Dayton, Ohio, with various types and spans of wing surfaces, and finally attacked the most troublesome problem (where all thus far had failed), the securing of lateral control. First, at Kitty Hawk in the autumn of 1902, they used a fixed vertical rudder or tail. Then they improved on this with a movable or adjustable vertical rudder. They also hit on the great principle of warping the ends of the wings to secure lateral control. The pilot now had three controls at his command, and the problem of control was finally solved. In this perfected glider they made over 700 flights at will with remarkable control of the mechanism and plane as a whole, and were able to glide in winds as high as 35 miles an hour.

Now the Wrights had a machine under perfect control by the operator. All that remained was the perfecting of the engine or motive power. Within a year they had designed an engine of

30 horse power, weighing but 7 pounds per horse power. By the autumn of 1903, everything was ready for the transition stage from glider to airplane. The Wright machine thus constructed was a biplane, with two main wings of a chord or span of 32 feet, and a width of 5 feet, giving a total wing surface of approximately 305 square feet. The front horizontal rudder, as they called it, had a sustaining area of 15 square feet, and the vertical rudder in the rear, an area of 6 square feet. Skids were used to support the machine on the ground, and the operator lay across the lower of the two planes. Without engine or load, the total weight was about 117 pounds; with pilot and engine, it was nearly 600 pounds.

When everything was ready in the autumn of 1903, they took the machine to Kitty Hawk for a final test. Before trying this, however, they made a few additional flights in the old glider. On December 17, 1903, the historic date of the first heavier-than-air flight, but five natives came to witness their great efforts, though the neighborhood had been freely invited to be present. On this memorable day, each brother made two flights, the first lasting 12 seconds and the last 59, covering a little over half a mile in the air and 852 feet over the ground. Wilbur Wright himself, in the *Century Magazine* in 1908, spoke of the first flight made that day as "the first in history of the world in which a machine carrying a man had raised itself in the air by its own power in free flight, had sailed forward on a level course without reduction of speed, and had finally landed without being wrecked."

During 1904 and 1905, experiments continued near Dayton, Ohio, in an improved machine, so that on September 26 of the latter year, they made a flight of somewhat over 11 miles, increased this little by little to over 24 on October 5, at a speed of about 38 miles an hour. So quickly did aviation develop that, when Wilbur Wright died in 1912, the airplane had already become important in commerce and war.

On December 17, 1928, just a quarter century afterward, Orville Wright again found himself at Kitty Hawk, North Carolina, this time as the guest of honor of the hundreds gathered to erect a monument in commemoration of the first successful flights. Here a granite boulder was unveiled, and this will be followed later with a large shaft erected from funds already authorized by Congress.

Contrast as you will in imagination the handful of spectators of that early experiment with the gathering of aviators and scientists from all areas of the civilized world in 1928.

THE PRINCIPLES OF LIGHTER-THAN-AIR CRAFT

Stones thrown into water will sink, but a stick of wood thrown into a pond will go down, and then rise, remaining partly submerged. The weight of the stick as a whole is exactly that of the water displaced by the part of the stick that lies below the surface. The weight of the water displaced is variously termed displacement, flotation or buoyancy.

The sustention of all lighter-than-air craft such as balloons or airships depends on this principle of displacement or buoyancy.

A balloon, for example, is filled with hydrogen which weighs roughly about 1/15th as much as air, and therefore must have buoyancy when placed in the atmosphere. For a rough estimate the weight of 1,000 cubic feet of air may be taken as 75 pounds, and of 1,000 cubic feet of hydrogen as 5 pounds. The buoyancy or lift of a balloon of 1,000 cubic feet displacement will therefore be only 75 minus 5, or 70 pounds. A gas bag of large volume, therefore, gives comparatively little lift, and this explains the tremendous dimensions to which airships have to be built when they are required to carry appreciable loads.

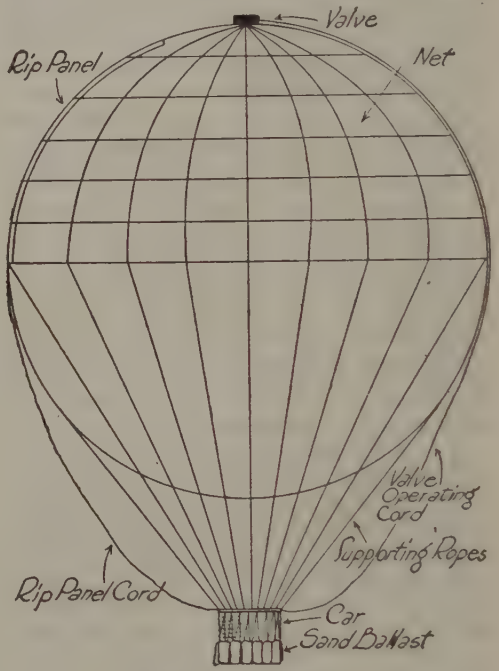

FIG. 1 Free Balloon

We have stated that the lift of 1,000 cubic feet of hydrogen is 70 pounds. But the lift depends evidently on the density of the air. In cold weather, air is much denser than in hot weather, and it is found in practice that the lifting power of an airship is greater in winter than in summer.

There is a great deal of theory involved in the maneuvering of a balloon, and balloon races are won by the most scientific competitors.

A free balloon when it leaves the ground is always "flabby," that is, not entirely filled out. As it rises and passes into a region of less dense air, the gas expands till the balloon becomes taut, It can only rise beyond the height where it becomes a full balloon, if the aeronaut (as the balloon pilot is called) throws out ballast in the form of sand. When all the ballast is expended, it is impossible to rise higher. To descend the aeronaut must valve gas, that is, allow some of

it to escape. Since the full balloon has a buoyancy exactly equal to its weight, the escape of a little gas may cause it to descend all the way to the ground, unless the descent is checked by the throwing out of ballast. A skilled balloon pilot will release only a few cubic feet of gas at a time, and throw out ballast in handfuls at a time.

A free balloon is usually constructed of rubberized fabric and varnished silk, and is filled with either hydrogen or coal gas. It is covered with a netting from which is suspended the basket carrying the pilot. The valve through which gas is allowed to escape at will is placed at the top of the balloon. In emergencies, when a quick descent must be made, a "rip panel" is used through which gas escapes much more rapidly than through the valve. The main parts of a free balloon are shown in the diagramatic sketch of Fig. 1.

an elevator for control in pitch. In addition, fixed fins are provided at the tail end or stern of the airship for stabilizing purposes. While in the non-rigid and in some semi-rigid types the passenger car is suspended at a distance from the envelope, in the rigid it is possible to build the car integrally with the structure and only the power cars are suspended away from the envelope.

The construction of the rigid airship is a particularly intricate one. In addition to the longitudinal girders which run the whole length of the ship, transverse frames or ribs are fitted at intervals. The transverse frames form compartments in each of which a gas bag of gold beater's skin is placed. This is enclosed in cord netting to distribute pressure and prevent chafing. The whole of the airship is covered with a waterproofed, rubber and cotton fabric which

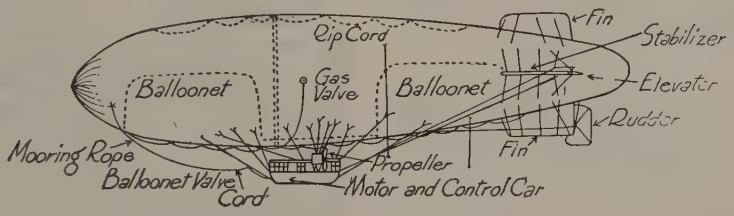

FIG. 2 Non-rigid Airship

A spherical balloon offers considerable resistance to side motion. Therefore, all lighter-than-air craft except balloons are not spherical, but streamline in form, and resemble a huge cigar.

Airships may be divided into three classes, non-rigids, which depend upon inflation of the envelope for maintaining the correct shape; semi-rigids, which rely partially on gas pressure and partially on a rigid keel running the whole length of the bottom of the ship; and rigids, which depend solely upon their structure for the maintenance of their form.

The three types of airships are illustrated in our diagrams. (Fig. 2, 3 and 4).

can be made to present a smooth surface to the air.

The propulsion of all types of airships is of similar type. A gasoline engine or engines mounted in a basket or power egg turns a propeller, which screws itself into the air like a giant screw, and in so doing produces a thrust or pull which drives the airship against the resistance of the air

PRINCIPLES OF HEAVIER-THAN-AIR CRAFT

Small, flat stones, even though heavier than water, so long as they are in motion, will slip

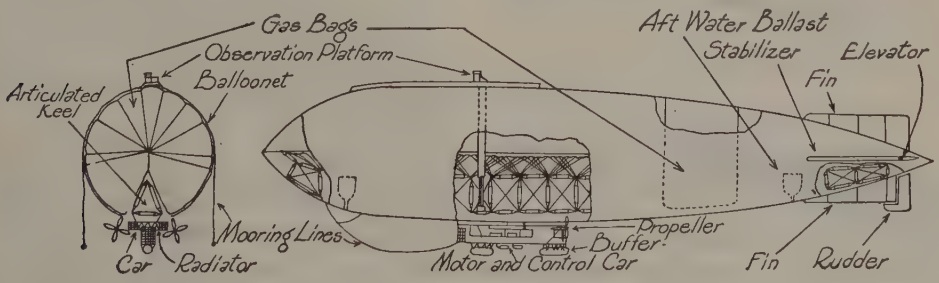

FIG. 3 Semi-rigid Airship

In the non-rigid and semi-rigid airships, balloonets or air bags are placed inside the main envelope. During the ascent, as the gas expands, these balloonets lose their air and fold up. On the descent as the gas contracts, the balloonets take in air through a scoop, fill out and keep the envelope from becoming flabby.

All airships, no matter what their type, are provided with a vertical rudder for steering, and

along the surface of the water. A man stationary in the water will sink. If he can propel himself by his arms and legs, the reaction of the water on his body will sustain him as long as he is in motion. Heavier-than-air craft, gliders and airplanes depend on the same principle of reaction.

If a board is towed through the water it will experience two forces: One at right angles to

the motion which is termed the lift, because it tends to raise the board; the other along the line of motion, which is termed resistance or drag, because it tends to oppose the motion.

trary to general belief, it is the upper surface which gives the greater part of the lift, namely two-thirds approximately.

Modern wings are beautifully streamlined and

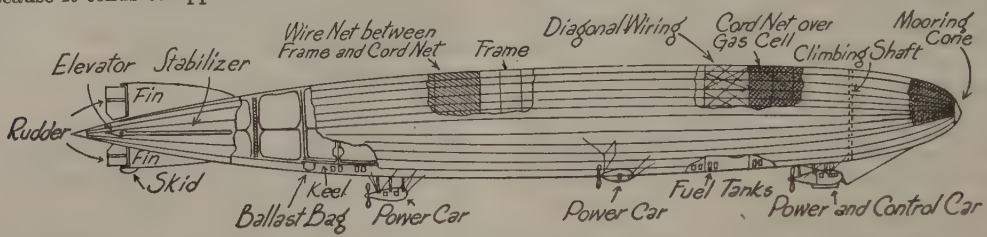

FIG. 4 Rigid Airship

The airplane or glider is sustained by a lift force produced in this fashion. The drag experienced has to be overcome by gravity in the case of the glider and in the case of the airplane by the thrust of the propeller, which in turn receives energy from the combustion of fuel in an engine.

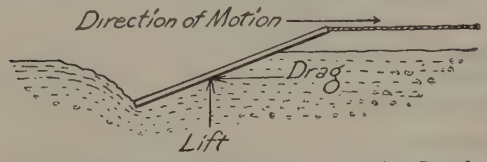

FIG. 5 Showing Lift and Drag on Moving Board

Naturally in the design of an airplane, we try to get as much *lift* as possible and as *little drag* as possible, or to make the lift over drag ratio high. An airplane weighing 2,400 pounds may need as much as 400 pounds thrust under certain conditions of flight. Its lift-over drag ratio is then said to be 2,400 ÷ 400, or six.

When a flat plate or surface is pulled through the air, the air flow is very much disturbed, with eddies or whirls on the top side as can be seen in Fig. 6.

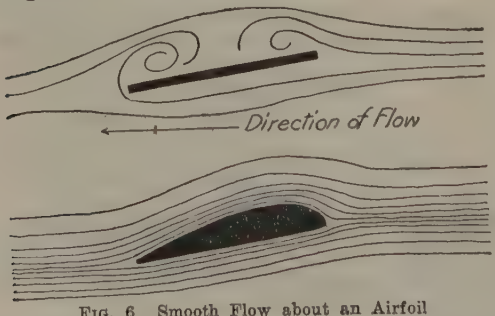

FIG. 6 Smooth Flow about an Airfoil

When a well designed wing or air foil is employed the *flow is free from eddies*, and is said to be *streamline*. This steady flow is also shown in a diagram.

Because the upper surface of a wing is cambered or curved, the air has to flow more rapidly above than below the wing. Owing to the rapidity of the flow, it loses some of its pressure and is said to be in suction. Accordingly, in an airplane wing, the air pulls up on the top surface, and pushes up on the lower surface. The pull and push of the air add up to give lift, but con-

surprisingly efficient. Their lift-over drag or efficiency ratio is sometimes as high as 20.

The length of a wing is called the *span;* the width is called the chord. The *aspect ratio* of a wing, as illustrated by our sketch, is the ratio of the span to the chord. A long, narrow wing is more efficient than a short, wide one because it experiences less tip loss due to the flow of air round the tips. For a monoplane, that is, an airplane with a single wing, the aspect ratio varies between 5 and 7. Designers would like to give the wing bigger aspect ratios, but then difficulties occur in making the wing strong enough. With biplanes, which it is somewhat easier to brace, it is possible to use larger aspect ratios up to eight or even ten.

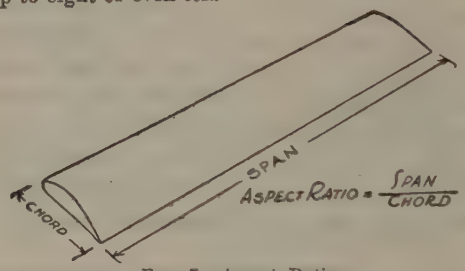

FIG. 7 Aspect Ratio

The *lift of a wing increases with its area, and with the square of the speed.* The lift varies with the square of the speed, because the faster the wing moves the more air comes in contact with it, and each particle of air coming in contact with the wing evidently exercises a greater reaction with increase in speed.

The more a wing is inclined to the flight path or wind direction, the more lift it will have for a given area and a given speed. The *inclination of* a wing is defined by the angle between the wind and the chord of the wing. This *inclination is termed the angle of incidence or attack.*

The lift of a wing does not increase indefinitely with the angle. When an angle of incidence of about sixteen degrees is reached, the lift reaches a maximum value. Beyond this angle, the streamline flow breaks down, the wing is said to *"burble" or stall,* and if inclined still more, it actually loses lift. One of the most frequent sources of accident is the "stall," in which placing the wing at too large an angle of incidence may result in loss of lift and control and a subsequent spinning nose dive.

There is no "best" wing in aviation. Thin

wings are generally most suitable for high speed planes. They have high efficiency at top speed, but poor maximum lift, and therefore planes with thin wings will tend to land fast. Heavily cambered wings are more suitable for commercial planes of moderate top speed, but are required to land slowly. In our diagram we show some typical wings, and indicate the uses to which they are most appropriate.

An important problem in the airplane is the maintenance of longitudinal equilibrium and

FIG. 8 Types of Wings

stability. Unfortunately most airfoils are unstable. The point at which the lift and drag act on the airfoil chord is termed the *center of pressure*. At small angles of incidence the center of pressure moves back, at large angles it moves forward. The center of gravity of an airplane, where all its weight may be considered concentrated, remains always at the same point, and is generally placed by the designer at one-third of the chord back of the leading edge. If the airplane had no horizontal tail surfaces, the movement of the center of pressure with reference to the center of gravity would produce instability. If the plane nosed up a little, the center of pressure would move forward, and would tend to nose the plane up more till it "stalled." If the plane

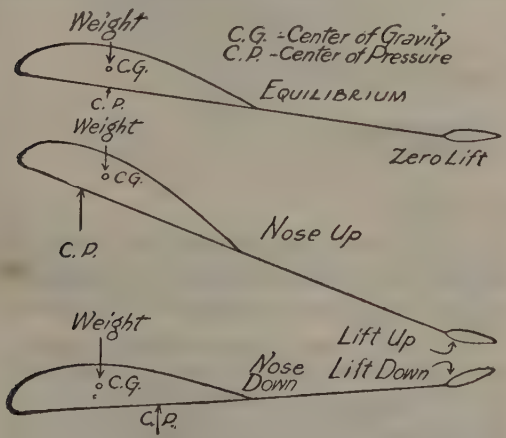

FIG. 9 Showing Instability of Wing and Manner in which Stabilizer Corrects It

nosed down, the center of pressure would move back, thus tending to nose the plane down still more until it would go down in a nose dive. This instability, illustrated by our sketch, is corrected by the fixed horizontal tail surface termed the stabilizer. This is placed at a negative angle to the wing. Accordingly, when the main wing goes to too small an angle of incidence, the stabilizer

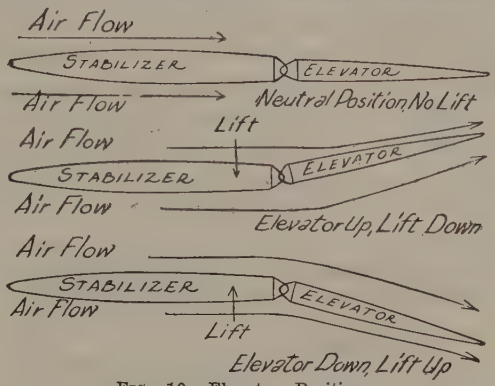

FIG. 10 Elevator Positions

has a downward force acting on it and therefore counteracts the diving tendency. If the main wing rises to too high an angle of incidence, the stabilizer has an upward force exercised on it by the stream of air and so the tendency to "stall" is checked.

Besides using a fixed horizontal stabilizer to secure longitudinal stability, it is necessary to provide a movable control surface, hinged at the rear of the stabilizer to provide longitudinal control. This movable surface is termed the *elevator*. Our drawing illustrates its action. When the elevator is turned up, the air strikes it from above, and the nose of the plane is turned up accordingly. When the elevator is turned down, the air strikes it from below, and the plane is accordingly nosed down.

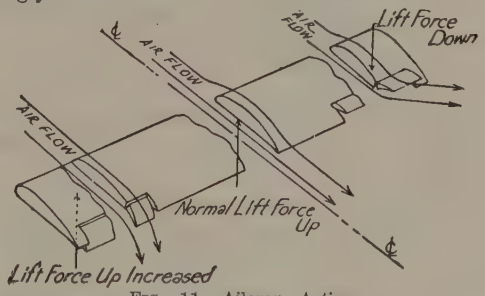

FIG. 11 Aileron Action

It was a great achievement of the Wright brothers that they saw the necessity of three controls, one for each axis of the airplane, and knew how to realize the three control system.

For lateral control in the modern airplane, movable surfaces termed *ailerons* are hinged at the rear outer portions of the wings. The control cables of the ailerons are so arranged that when one aileron is turned down, the other is turned up. If the wing of the airplane goes down on the right side, the pilot turns the right aileron down, the air strikes the aileron on its under surface and a restoring moment is introduced. The aileron on the other side is turned up, receives the air on its upper surface and also exercises a restoring moment, the effects of the two ailerons helping one another.

When a side wind hits an airplane, it is essential that its nose should turn into the wind, or that the plane behave like a weather cock. Weather-cock stability is achieved by placing a vertical fin at the tail of the fuselage. When the side wind strikes the fin, it is clear from our sketch that the nose of the plane will turn into the wind.

Steering is achieved by a vertical rudder hinged in back of the vertical tail fin. When the rudder is turned to the right, the air strikes it from the right, and the nose of the plane turns to the right. Conversely, when the rudder is turned to the left, the nose of the plane also turns to the left.

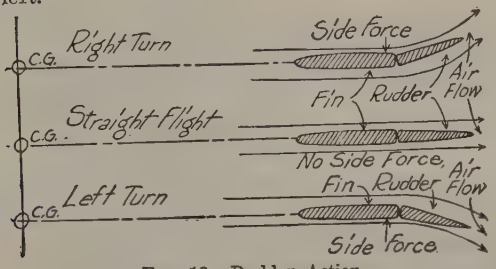

FIG. 12 Rudder Action

THE MAIN PARTS OF AN AIRPLANE

The airplane is far less standardized in its design than an automobile and always will be. The automobile is severely restricted in length of chassis, width of wheel base and the speed which can be safely employed. The airplane can be a tiny "flivver" or a giant transport machine of 25 tons gross weight, and it can have one, two or more wings, and its speed does not seem to have reached anything like its limit as yet. In describing the main parts of the airplane, we have selected one type only, which is representative of today's practice, namely, an enclosed cabin monoplane, which is shown in diagrammatic form.

The nine cylinder air-cooled engine of about 200 horse power is carried at the nose of the fuselage, with the rear part of the crank case bolted to a mounting ring. On the forward end of the crank case is an extension on which the hub of the propeller is fitted. The air intake to the carburetor is placed underneath the fuselage, so that fresh, clean air only is admitted to the carburetor. All the exhaust manifolds lead into a single exhaust ring, which has at its lowest point a single large exhaust pipe which leads the exhaust gases away from the passenger compartment. The oil tank is mounted close behind the engine, so as to lessen the length of oil piping. Throttle and spark controls run from the left side of the pilot's cockpit, close to the pilot's left hand. The throttle and spark controls consist of solid rods, with bell cranks at appropriate points. Cables are not advisable for engine controls because they are liable to become slack. The fuel tanks are mounted in the monoplane wing on either side of the fuselage, thus reducing the fire hazard. The fuel tanks are connected by simple piping to the float chamber of the carburetor. Fuel, therefore, flows to the carburetor by gravity alone, and all fuel pumps are thus avoided. A fuel tank gage is mounted in the tank, with its dial easily seen by the pilot. Careful power plant installation is a great factor in the reliability of an engine.

The pilot's cockpit is at the forward end of the cabin. Windows of non-shatterable glass give the pilot vision in all directions while protecting him from the weather. In front of the pilot are the instruments, grouped according to function. On one side are: The air-speed indicator which shows the speed relative to the air; the altimeter which shows the height above the ground; and the inclinometer in which a bubble of air in a curved tube filled with colored alcohol shows whether the plane is on an even keel or not. In the center of the instrument board is the compass which is indispensable for cross-country flying. On the left side of the instrument board are grouped the engine instruments, the tachometer which shows the revolutions per minute of the engine; the oil pressure gage which shows whether the engine is being properly lubricated and the oil temperature gage which serves a similar purpose.

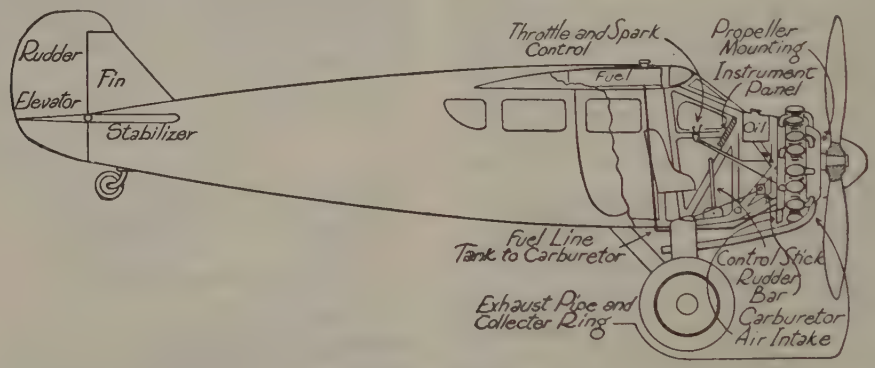

FIG. 13 Parts of Airplane

The pilot's flying controls consist of the control stick, commonly called the "joy" stick and the rudder bar. The ailerons, elevator and rudder are actuated by these two important parts of the airplane. The action of the flying controls is illustrated by the drawings, which show that a forward motion of the stick turns the elevator down, and therefore dips the nose of the plane. Pulling back on the stick turns the elevator up and raises the nose of the plane. The movements of the stick for longitudinal control are therefore

quite instinctive. In the same way, pushing the stick to the right will turn the right aileron up, the left aileron down, and therefore the plane as a whole will go down on the right side. Again the movement is instinctive. Pushing the right forward on the rudder bar will turn the nose of the plane to the right. This is somewhat different from the action required with the steering wheel of an automobile, but rudder action is soon learned. In fact the use of all the flying controls is but a matter of a few minutes.

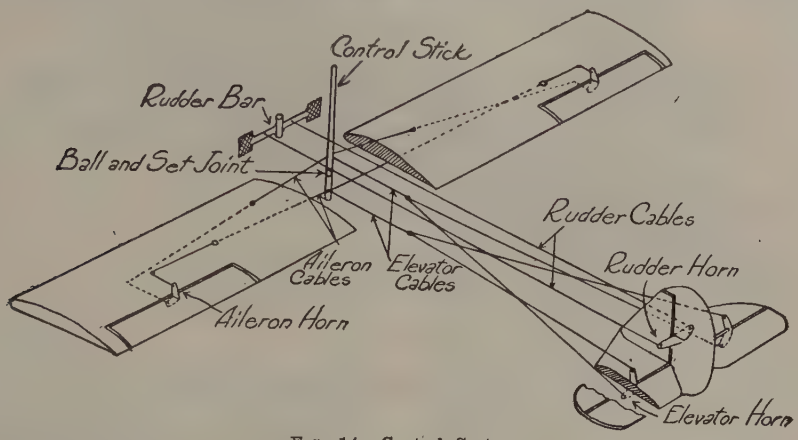

FIG. 14 Control System

Back of the pilot is the passenger's cabin, with ample vision through the sliding windows. Electric lighting by means of a battery, and heating by means of air which has been warmed by passing round the exhaust pipe are always available in a modern passenger plane.

The fuselage of the modern airplane, in which engine, pilot, passengers, etc., are housed, is generally made up of welded steel tubing. Formerly, wooden struts and wires were used, but welded steel tubing has replaced stick and wire, because alignment is better maintained, and because in a crash, tubing will bend but not break and splinter. Many fatalities have been avoided by the use of tubing.

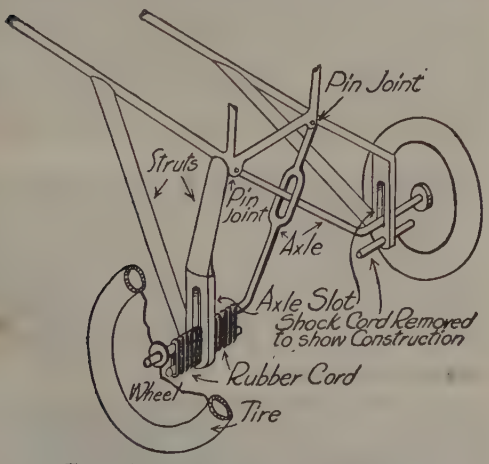

FIG. 15 Divided Axle Landing Gear

The landing gear of an airplane is a very important part. In the hands of a skilled pilot, a perfect three-point landing can be made after flattening out gently from a glide, without the slightest shock. But sometimes such a perfect landing is not possible. Therefore, the landing gear has to be so constructed that it can take up shock. This is done frequently by making use of rubber shock absorbers. As shown in our drawings the struts can descend relative to the wheels against the restraining action of rubber cords. The placing of the wheels of the landing gear is important. The center of the wheels should be some distance ahead of the center of gravity of the airplane, so that if the wheels meet a bump the airplane does not nose over.

While accidents still happen in airplanes, structural failure in the air never happens nowadays, so much care have engineers given to the design and construction of the wings. (See Fig. 16)

The contour of the airfold is maintained by the ribs, placed along the span of the wing at intervals of approximately one foot. The doped and varnished cotton fabric, which constitutes the wing, is sewed to the ribs, which are placed about one foot apart along the span of the wing. The ribs maintain the contour of the air and transmit the lift of the wing surface to the two spars which provide strength against bending. The front and rear spars are braced against the drag of the wing by an intricate trussing of wires and compression struts. The forces on the wing are relieved by the external lift struts which carry a part of the wing load directly to the fuselage.

AIRPLANE ENGINES

Historical Development

The four cylinder water-cooled engine built by the Wright brothers in 1903 had approximately 21 horse power and weighed 152 pounds, so that the weight per horse power was 12.7. Since that time, as a result of continued effort in every country, the aircraft engine has improved beyond recognition. Today there are air-cooled engines in production, weighing not much more than 1 pound per horse power, and the aircraft engine has become a most reliable and certainly the most refined prime mover built by man.

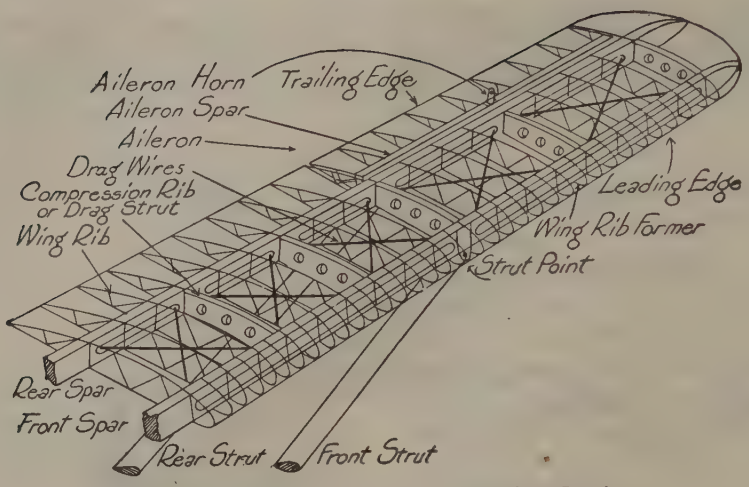

FIG. 16 Wing with Semi-Cantilever Monoplane Bracing

Prior to the World War aircraft engine horse powers remained quite moderate. The best known engine at the outbreak of the Great War was probably the Curtiss OX, which had eight water-cooled cylinders, arranged in V form, and developing 90 to 100 horse power at 1,400 revolutions per minute, and weighing a little over 4 pounds per horse power. In Europe, perhaps the most distinctive types were the rotary air-cooled engines such as the Gnome (80 horse power) and the Le Rhone (110 horse power). These were much lighter than the Curtiss OX and very compact. They played a very useful part in the early history of aviation. Their chief drawbacks were the windage losses of the rotating cylinders, the difficulty of securing perfect lubrication, and their lack of reliability. They were never built in larger powers than 110 horse power and have now been completely superseded.

The World War gave a tremendous impetus to the development of the engine. Since supremacy in the air was vital to the combatants, and since fighting supremacy was dependent on speed and climb, which in turn depended largely on horse power, each side tried to develop more and more powerful engines. At the end of the War the British and French were using the 300 horse power Hispano-Suiza, an 8-cylinder water-cooled V engine, with great success. The Germans concentrated their efforts on 6-cylinder vertical engines, developing not more than 225 horse power, somewhat heavy in construction but wonderfully reliable. The outstanding engine achievement of the United States was the famous Liberty motor. This was to some extent a derivative of the Hall-Scott engine, but involved a new design said to have been produced in a Washington hotel by Colonel J. G. Vincent and Colonel Hall. Not only did the United States produce the most powerful aircraft engines of the War, but with our understanding of production methods, enormous numbers of Liberty engines were built. Had the War continued the United States would have produced more engines than the rest of the Allies and the Germans combined.

As it was, the American government at the end of the War had an enormous surplus of Curtiss OX and Liberty motors on its hands. These were sold at low prices to commercial interests. The OX engines, costing thousands of dollars, were sometimes sold for as little as $32, and enabled designers to produce cheap two and three seater planes, which proved invaluable for training and aerial service work. The Liberty motors for several years gave invaluable service to the air mail planes, and continued to be widely used up to a year or so ago.

During the War, the rotary air-cooled engines had given away to the water-cooled type, nevertheless designers felt that air cooling was entirely logical for the aircraft engine. The automobile engine may be called upon to give its maximum power when the car is moving slowly, as in going up a steep hill, and air cooling is then a difficult proposition. In the airplane, there is always a rapid stream of air to be relied upon, and hence air cooling is far more plausible. It has also been found that most of the power plant failures are due to water-cooling troubles, and air cooling has therefore given the airplanes greater reliability. Air-cooled engines have also proved lighter than the water-cooled types, and also dispense with the weight of radiator and water.

In Europe, the development of the air-cooled type has been mainly in the hands of the Bristol Company of England, which starting with a 3-cylinder 100 horse power type, has now produced the Bristol Jupiter, a 9-cylinder type of 450 horse power, weighing approximately 1½ pounds. In England also has been produced the well-known Cirrus engine, with 4 air-cooled cylinders in line. This develops 85 to 95 horse power and weighs 270 pounds.

It is in the United States that the air-cooled engine has taken the greatest development. Charles L. Lawrance, in 1919 and 1920, produced the first successful American air-cooled engine, a 3-cylinder 60 horse power type. Since that time the development of such engines has been very rapid. The famous Wright Whirlwind carried Lindbergh across the sea, and has been employed on innumerable airplanes. Other well-known engines of the radial air-cooled type are the Pratt and Whitney Aircraft Company's Wasp and Hornet

which are being largely used in large mail and passenger planes.

At the same time the water-cooled engine has remained in favor with many designers, particularly in the large sizes. The Curtiss Company in the United States has remained a firm exponent of the water-cooled engine, on the ground that it allows a better streamline for the forward part of the fuselage, since there are no projecting cylinders exposed to the air stream, and that higher speeds may be attained by its use. The Curtiss Company is now placing on the Commercial market the Conqueror 12-cylinder water-cooled engine of 650 horse power. At very high speeds, there is no doubt that the water-cooled engine offers a real superiority over the air-cooled type. The Schneider Cup races, in which speeds of over 300 miles an hour have been attained, have always been won by water-cooled engines, in some cases developing 1,200 horse power for as many pounds.

European engineers have also held to the view that for large commercial planes flying in all weather conditions, greater reliability could be secured with water cooling. On most European aircraft engines have shown tremendous gain in reliability. It is not uncommon for modern engines to stand up to an endurance test of more than a hundred hours at full power, and whereas the Liberty motor required complete overhaul at the end of 100 or 150 hours, an engine such as the Wright Whirlwind needs a complete overhaul only at the end of 300 hours, and with proper care may have a life of 1,500 hours. Aircraft engines have also progressed in the reduction of frontal area, and in the matter of cost and efficiency. Progress has been achieved by no radical departures, but by steady increase in skill in design, particularly in regard to cutting down dimensions and to increasing the speed of revolution while still maintaining perfect intake and exhaust and combustion. Progress has also been dependent on the use of the strongest and most refined materials. More than 40 different materials go into an aircraft engine, such as magnesium (which is lighter than aluminum), aluminum-bronze for valve insets, duralumin forgings for connecting rods (duralumin is an alloy of aluminum, copper, nickel and magnesium), high strength alloy steels and many others.

MODERN PRACTICE

Name of Engine	Rated Horse Power	Rated Revolutions Per Minute	Type of Cooling	Weight Dry	Weight in Pounds Per Horse Power	Fuel Consumption Per Horse Power in Pounds	Arrangement of Cylinders

air lines, water-cooled engines such as the Napier "Lion," the Rolls-Royce "Condor" and the Hispano-Suiza are employed to this day.

So many aircraft engines are now available, that it is difficult to select the most representaaive types. The above table is, however, a fair indication of current practice, and gives an idea of earlier practice also.

Besides tremendous improvement in the weight per horse power as shown by the above table, aircraft engines have shown tremendous gain in reliability. It is not uncommon for modern engines to stand up to an endurance test of more than a hundred hours at full power, and whereas the Liberty motor required complete overhaul at the end of 100 or 150 hours, an engine such as the Wright Whirlwind needs a complete overhaul only at the end of 300 hours, and with proper care may have a life of 1,500 hours. Aircraft engines have also progressed in the reduction of frontal area, and in the matter of cost and efficiency. Progress has been achieved by no radical departures, but by steady increase in skill in design, particularly in regard to cutting down dimensions and to increasing the speed of revolution while still maintaining perfect intake and exhaust and combustion. Progress has also been dependent on the use of the strongest and most refined materials. More than 40 different materials go into an aircraft engine, such as magnesium (which is lighter than aluminum), aluminum-bronze for valve insets, duralumin forgings for connecting rods (duralumin is an alloy of aluminum, copper, nickel and magnesium), high strength alloy steels and many others.

Main Characteristics of the Aircraft Engine

The aircraft engine in its principle and main characteristics is similar to the automobile engine. It has to withstand higher continuous loads than the automobile engine and has to be much lighter for a given horse power, so that its design is very much more refined. The basic problems of both the automobile and the aircraft engine is to mix the fuel (gasoline) and air in-

timately in the correct proportions, to produce as perfect combustion as possible, and to convert the energy of combustion into mechanical power.

The combustion takes place inside the cylinder, which is the heart of the engine. The cylinder in aircraft practice is generally machined from a solid block of steel. The cylinder is open at its lower end; at the top is closed in by a cylinder head which is generally an aluminum casting, screwed in or shrunk into the cylinder. Inside the cylinder is the cup-shaped piston, arranged to slide up and down in the cylinder. The piston rings are carried in grooves in the piston, and press fairly tightly against the cylinder walls, so that leakage of gases past the piston is prevented. There is a piston pin in the piston round which the connecting rod can oscillate. The other end of the connecting rod embraces the crankpin, which is fixed in the crank arm of the crank shaft. As the piston moves up and down in the cylinder, its reciprocating motion is converted into rotational motion of the crankshaft. On the front end of the crankshaft is mounted the propeller, which gives propulsion to the aircraft. The intake valve and the exhaust valve are mounted in the cylinder head, and are operated by push rods, and springs. The push rods are themselves driven by the camshaft which in turn is driven by gearing from the crankshaft.

The conventional gasoline engine is said to have a four-stroke cycle, because the process of taking in gas, compressing, fixing and exhausting takes place in four strokes of the piston, two up and two down. At the beginning of a cycle, the piston is at the "top-center" position on the cylinder. As the crankshaft revolves (being moved either by starter or by the action of other cylinders) the piston descends and at the same time the inlet valve opens by means of the mechanism previously described. The downward movement of the piston, termed the suction stroke, produces suction or low pressure in the cylinder space above it, and a mixture of fuel and air is drawn in through the intake valve accordingly. When the piston reaches bottom center, the inlet valve closes. The further rotation of the crankshaft then moves the piston up again. Since the valves are closed, this stroke, termed the compression stroke, serves to compress the mixture of air and fuel to a high point. The efficiency and power of the engine are greatly increased by this compression of the mixture before its ignition by an electric spark. At or near the end of the compression stroke, a violent electric spark jumps across the points of the spark plug. The mixture is ignited, and the fuel burns or explodes rapidly, combining chemically with the air. The burning of the fuel produces a very high temperature in the cylinder (hence the necessity of cooling the cylinder walls) and a high pressure acting on top of the piston. This high pressure acting on the downwardly moving piston during the third stroke, which is termed the power stroke, delivers the energy of combustion in the form of turning moment to the crankshaft. Near the end of the power stroke, the exhaust valve opens, and on the last stroke of the cycle, when the piston is again moving upward, the burnt gases are ejected through the exhaust valve. The cylinder is then ready for another charge of fuel and air, and for another working cycle.

The pressure at the end of the compression stroke is about 95 pounds per square inch. Usually during the compression stroke the mixture of gas and air is compressed into a space 5½ times as small as that when the piston was at the bottom of the stroke. The compression ratio is then said to be 5½ to 1. Greater compression would mean better efficiency, but if too high compressions are used, without special fuels, the combustion becomes too rapid and severe knocking or detonation may be produced, with which motorists are also familiar.

The temperature in the cylinder after the combustion of the fuel is tremendously high—over 4,000 degrees Fahrenheit. Subjected to such enormous temperatures the cylinder walls, unless suitably cooled, would cause the piston to seize and the lubrication would fail. Hence the necessity for cooling the walls by means of water jackets containing circulating water, or by aluminum fins cast integrally with the cylinder head. Aluminum is a particularly good conductor of heat, and is used in the fins for this reason. Sometimes, for extra cooling, the steel cylinder also has fins machined on its outer wall as shown in our diagram. When a finned air-cooled cylinder is used it has to be subjected to the blast of the propeller, or slipstream as it is termed.

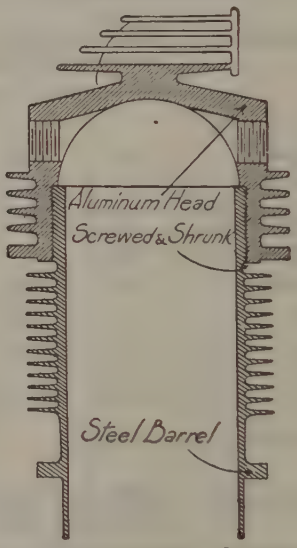

FIG. 17 Typical Cylinder Construction

The aircraft engine cannot function without a number of accessories, one of the most important of which is the carburetor. The working of the carburetor is perhaps more difficult to understand than the working of the engine itself. The diagram of Fig. 18 shows a carburetor in its simplest form. The full supply line is led from the fuel tank to a chamber in which there is a pivoted float. When too much fuel is coming from the fuel tank, the float shuts off the supply by means of a needle valve. From the float chamber the fuel passes to a small nozzle through a pipe bent at right angles. As air from the outside rushes into the engine under the pull of the suction stroke, it passes rapidly through a narrow channel or Venturi, and in so doing sucks

fuel from the nozzle and at the same time mixes the fuel intimately with the air. A throttle valve, controlled by the pilot, regulates the amount of fuel and air admitted to the engine, and hence the power output of the engine.

The ignition system of an aircraft engine generally consists of a high tension magneto in which coils of wire wound on an armature, rotated by gearing from the engine crankshaft, and revolving under the influence of a powerful magnet, produce electric energy. By a suitable system for interrupting the electric system and by a mechanically operated distributor, a high voltage spark is made to jump the points of the spark plug located in each cylinder at appropriate points on the engine cycle.

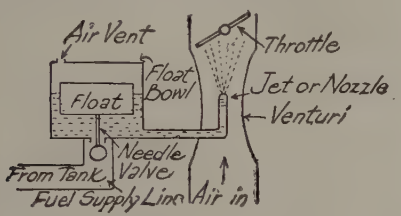

FIG. 18 Simple Carburetor

Correct lubrication is an essential part of the aircraft engine. Oil is supplied to the bearings of the crankshaft, by a pump driven from the engine crankshaft, and is led into holes drilled in bearings, and is then thrown out as a spray on the cylinder walls and the piston. After lubricating the various parts of the engine, the oil passes to the bottom of the crankcase from whence it is withdrawn to the oil tank by means of a scavenging pump. As the oil passes round and round, it is sometimes cooled by a special oil radiator.

Typical Engine Arrangements.

In the appended figure, the typical arrangements of the engine of today are illustrated. from where it goes back to the bottom of the water jackets. Designers have built water-cooled engines with three backs of 6-cylinders each, making 18 cylinders in all, and with four banks of 6 cylinders each. The two banks of 6 cylinders remain the most typical arrangement.

(b) The arrangement of cylinders in star or radial form gives a wonderfully light and compact arrangement, so this form remains very popular in spite of its head resistance and obstruction of the pilot's vision.

(c) To decrease the head resistance of the radial engine, various forms of cowling have been suggested, with the air entering at the center, but the top of the engine covered in by the streamline cowl. The use of such a cowl increases the speed of an airplane considerably.

(d) The four cylinder in line, is somewhat heavier in basic construction than the radial, but is simpler in construction, and has less head resistance. This type is becoming increasingly popular for the light plane, and for the training plane.

Future Developments of the Aircraft Engine

It is hard to forecast the future development of the aircraft engine, but competent observers predict that the Diesel engine, burning heavy, non-inflammable oil, will in a few years largely displace the gasoline aircraft engine of today. The Diesel engine besides greater safety offers the possibility of greater efficiency and lower cost of fuel. The difficulty in employing the Diesel is its weight, which is high because of the very large pressures developed inside the cylinder. The Packard Motor Company has, however, already successfully built an aircraft Diesel which weighs only 610 pounds for 200 horse

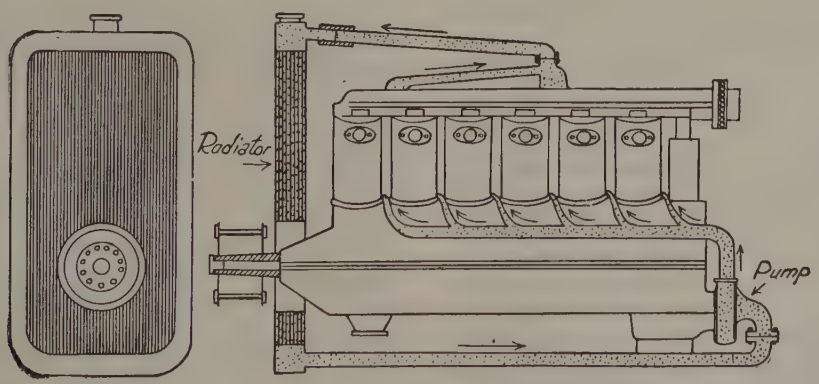

FIG. 19 Water Cooling System

(a) The diagram of Fig. 19 shows a 12-cylinder V engine of the water-cooled type, like the Liberty motor, together with its cooling system, in which water is circulated by means of a water pump. The hot water tends to rise naturally, and so the hot water from the top of the engine water jackets passes to the radiator, where it is cooled by the blast of air passing through the radiator, and then goes down to the water pump,

power. The Packard Diesel is a 7-cylinder radial air-cooled engine, but its characteristics have so far been kept jealously secret. In the more conventional gasoline engine, engineers believe that the vertical in-line engine will to some extent displace the radial engine, because the head resistance is thus diminished, and the pilot's vision is less impeded. For the very large planes of the future, water-cooled engines of over 1,000

horse power are likely to be developed. There is some possibility that some chemical having a higher boiling point than water will be used as a cooling medium.

RECENT TYPES OF COMMERCIAL AIRPLANES.

There are now some two hundred airplane manufacturers in the United States, building every variety of commercial airplane, and it is very difficult to select the most typical. A table of the characteristics of some of them is appended.

In the light plane class used for primary training and interesting to the sportsman owner, we can cite the Aeromarine-Klemm AKL-25-A. This is a two-seater monoplane, with cockpits in tandum. The spread of the wing is 40 feet 2 inches, and the over-all length is 24 feet 8 inches. The engine is a Salmson 9-cylinder air-cooled developing about 50 horse power. The high speed is about 85 miles an hour. The weight fully loaded is 1,430 pounds and the wing area is 210 square feet. The AKL-25-A is said to be a low wing monoplane because the wing is placed at the bottom of the fuselage or body. The wing is said to be tapered, because it is wider near the fuselage, where maximum strength is required, than at the top. This monoplane is said to be internally braced, because no external struts or wires are used to brace the wing. Dispensing with such external bracing diminishes the head resistance of the plane, although the weight of the wing is heavier than is the case when external bracing is employed.

For more advanced training, particularly for acrobatic work, it is customary to employ a more powerful engine. An excellent example of the advanced training plane is the "Trainer" manufactured by Great Lakes Aircraft Corporation, and powered with a 90 horse power Cerries engine. The monoplane is probably more efficient than a biplane, but a biplane is apt to give a smaller and more maneuverable craft, and the Trainer is a biplane accordingly. The instructor in such a place occupies the front cockpit, and the student occupies the rear cockpit. The wings are "staggered," the upper wing being somewhat ahead of the lower plane. This "stagger" gives better vision for the flyers, and also gives them a clear parachute jump in case of emergency. The Trainer lands faster than the Aeromarine-Klemm, but it has also a higher maximum speed, namely, 110 miles per hour.

For the long hauls and large loads of the Transcontinental air lines, it may be necessary to employ large three-engined planes (particularly when passengers are to be carried and the greatest possible security against power plant failure is needed). For shorter or feeder air lines, a smaller type of cabin plane is more popular. An excellent and typical feeder line plane is the Fairchild 71 built by the Fairchild Airplane Company. This carries a pilot and six passengers. Dual control is provided (dual control for planes of over four or five occupants now seems to be the rule). Since the weight of the plane fully loaded is 5,500 pounds, a much more powerful engine is employed, namely, the Pratt & Whitney "Wasp" of 425 horse power. The top speed is 138 miles per hour. The Fairchild 71 is termed a high wing monoplane, because the wing is placed above the body. The wing bracing is very typical of American practice and is said to be of the semi-cantilever type, with the wings supported at about midway of their length by lifting struts on either side of the fuselage. With the increase in the number of planes, our hangars are becoming crowded. In the F71 by removing a pin or two and in a few minutes, the wings can be folded back, and much less space is then required.

The main justification of the airplane is its speed. Two or three years ago a cruising speed of 100 miles an hour was considered quite good for air transport work, but requirements are growing steadily higher, and many authorities predict cruising speeds of 200 miles per hour in the next few years, in which case San Francisco will be only a night's run out of New York City. An example of this increasing requirement of speed is the Fokker Super-Trimotor which is powered with three Wasp engines of 425 horse power each. The Fokker Super-Trimotor can fly and even climb on any two of its three engines. It is a 14-place cabin monoplane with two pilots seated ahead of the cabin. The pay load is 2,250 pounds (that is load which can be commercially profitable, mail, express, and passengers) and the gross weight is 12,500 pounds. Fully loaded the Fokker Super-Trimotor can develop a speed of 145 miles per hour.

Seaplanes are becoming increasingly useful and popular. They can be either hydroairplane, flying boats or amphibions. The hydroairplane is built exactly like a land plane, but instead of a landing gear, one or two floats are used to give buoyancy in the water. In the flying boat, a regular boat hull is used both to give buoyancy and to house crew, passengers and equipment. The amphibion is a type of craft which can alight on either land or water, and is in many respects the most useful of all aircraft. It is particularly valuable for transport between large cities where the landing fields are at some distance from the center of the city, but river or other water areas are generally available in the very heart of the city. One of the best known amphibions is the Sikorsky S-38, in which wheels at the side of the main hull operate as a landing gear, but can be swung up by hydraulic means when a water landing is required.

One of the most pronounced tendencies in the construction of airplanes is the substitution of metal (particularly the light and strong aluminum alloy known as duralumin). Just as in the history of all other vehicles of transportation, it may be confidently expected that metal will ultimately displace wood altogether.

Particularly in Europe, very large planes are in process of construction. Junkers in Germany is building a 100-passenger plane, and Dornier will soon be testing a huge flying boat, equipped with twelve engines of 500 horse power each.

Recently La Cierva's Autogiro has attracted much attention by its successful flights and it is now being built in the United States by Pitcairn Aircraft. The Autogiro is neither an airplane nor a helicopter, although it resembles an air

plane in everything except the lifting surfaces. Instead of fixed wings, the Autogiro is supported by a huge four-bladed windmill, whose blades are free to rotate about a vertical shaft, and also move slightly up, so that no sidewise moments are introduced. The great advantage of the Autogiro is that while the craft as a whole may be moving very slowly, the blades are still moving rapidly and providing ample lift. As a result of this principle, the Autogiro can land very steeply and slowly and runs only a short distance after landing. This makes its use very attractive for the private flyer.

The helicopter or directly rising machine has attracted the attention of many workers, both in Europe and the United States, and is certainly a fascinating conception. The Berliner and De Bottiezat helicopters in the United States, the Pescara Damblanc and Oehmidieu helicopters in France have made short flights and shown possibilities. The difficulties of gearing in transmitting power, the inefficiency of the lifting airscrews in forward flight, and the difficulty of control while rising vertically or hovering are very great and all these inventors have ceased development work. Many well-informed authorities nevertheless believe that some day a practical helicopter will be achieved which will give man complete freedom in the air.

COMMERCIAL AVIATION.

Safety. The safety of commercial flying on regular air lines compares favorably with the transportation of passengers by automobile. Immediately after the World War a considerable stock of military aircraft remained which, purchased cheaply and employed without supervision, led to many accidents. This war material has been gradually used up or discarded to give way to modern planes, which have immensely improved in the last decade, especially in the last two or three years. The establishment of the Aeronautics Branch of the Department of Commerce with the licensing of pilots and planes, has also greatly increased safety. Another help to safety lies in the various aids to navigation now supplied by the government such as lighting and marking of airways, mapping of airways and weather service to pilots.

Flyers who attempt "stunts" for entertainment, or who run unusual risks, necessarily take their lives in their hands, and weather hazards such as gales, fogs, and thunderstorms always remain. But for aircraft operating with good ground organization, on regularly scheduled air lines the degree of safety already attained is quite remarkable, and the great majority of fatalities are confined to experimental, hazardous, or unusual conditions of aviation. Statistics as to safety are somewhat confused but a few figures will bear out the above argument. The Curtiss Company in the United States carried 4,000, and trained 60 pilots, in 1925 without a single major accident. In three years, the air mail service, which functions under all weather conditions, lost by death in flying a total of only

TYPES OF AIRCRAFT

	Type	No. of Passengers	Number of Motors	Total Horse Power	Length	Span	Wing Area	Maximum Speed	Landing Speed	Service Ceiling	Price
Keystone "Patrician"	CML	20	3	1,575	63′	90′	1,000	151	57	17,400	$90,000

five pilots. In 1926, over 3,700 persons took air rides in Philadelphia at the Exposition or enroute from Washington, D. C., and points south as far as Norfolk, without a single injury. In the Aeromarine Services, 26,000 traveled from Florida to Havana with only one major accident. Four thousand persons have flown by air between Cleveland and Detroit, and 43,000 have crossed the English Channel with complete safety. These statistics are more or less typical, and it is estimated that but one death occurs for every 1,250,000 persons carried by air.

It is confidently expected that the next few years will see even greater advances in aviation safety, on the following grounds. The public, becoming acquainted with the work of the Department of Commerce, will refuse to patronize any but licensed aircraft manned by licensed personnel. The use of multi-engined planes for passenger transportation will eliminate the hazard of power plant failure. At the same time, the immense increase in the number of airports and landing fields will lessen the danger of forced landings. The Daniel Guggenheim Safe Aircraft Competition has focused the attention of designers on the construction of planes which without losing their speed qualities, will land far more slowly, and require only a short landing run. The national extension of the weather service will warn pilots of dangerous weather conditions. The dangers of fog flying are being lessened by the greater use of reliable instruments, and by the systematic instruction of pilots in "blind flying."

Air Transport in Europe. Shortly after the Great War, commercial aviation began to develop tremendously in various countries. Some typical figures will show the trend. For the year ending on May 1, 1920, aircraft transported in England some 70,000 people, on 38,954 flights, a total of 737,000 passenger miles, and in addition 116,000 pounds of goods. Valuable and perishable commodities lead necessarily, it being quite common to ship gold and money by air, but almost everything, even to a live tiger, has been carried. From London service by air radiates in nearly all directions except across the Atlantic. One can travel to almost all the European capitals, to Morocco and other points in Africa. Within six years more than 60,000 people crossed the Channel to or from England. In 1923 alone, 1,400 airplanes checked in or out of the London airport, and the value of goods carried rose to nearly $4,000,000, one-fourth of which went to Paris. In 1924, the Imperial Airways, under government control, replaced the four private companies, and under a subsidy British commercial aviation has developed fast. From the Croyden airport near London, the trip is made to Brussels in 2 hrs. 45 m., to Cologne in 5 hrs., to Hamburg in 6 hrs. 45 m., to Berlin in 7 hrs. 45 m., and to Paris in 3 hrs. or less, whereas the boat-train schedule calls for 7 or more hours.

By 1928, in England airplanes were in service or designed to carry from 10 to 40 persons. The French Farman Company carries from 12 to 20 passengers in each plane. A German seaplane is being constructed to carry 100 across the Atlantic; and the Italian Ricci quadruplane was expected to transport, under favorable conditions, at least 150 persons and 14,000 pounds of cargo as far as Brazil.

Between 1919 and 1925, commercial aviation in France increased 833 fold or from 9,124 letters to over 7,500,000. France, in 1924, had 5 companies, 9 lines, 80 pilots, 260 planes, which carried 16,728 passengers on 11,800 trips, with almost 2,000,000 pounds of freight and half as many of mail. In 1926, 35 planes were being flown, and 4,720,000 letters were carried in the first nine months. Germany increased rapidly in 1925 and 1926, with 50 lines in operation, carrying 56,000 passengers in 1926, while letters and freight increased 5 fold and distance 3 fold over 1925. England carried 21,000 passengers and 618 tons of freight over the Channel in six months of 1926. Altogether, in 1926, Europe had 33 commercial companies, most of which carried both cargo and passengers.

Air Transport in the United States. The air mail service was inaugurated between New York and Washington, D. C., in 1918. During the first year only two planes were used, one of them carrying in all 826,000 letters in 10,716 miles of flying, and for a total of 164 hours in the air. Nine contracts were let the private companies in 1926, which attained 378,000 miles by the end of the year. Between June and the end of December, 1926, the Boston-New York line covered 75,500 miles, carrying 6,600 pounds of mail; the Chicago-Dallas line covered 29,000 miles, carrying 58,000 pounds, and the Los Angeles-Salt Lake City line covered 328,000 miles, carrying 70,000, and 258 passengers.

One of the most reliable and comprehensive sources of information on American commercial aviation is to be found in the Aircraft Yearbook published by the Aeronautical Chamber of Commerce, from which the following information is largely drawn.

During the year 1928, commercial air transport in the United States underwent tremendous expansion.

At the end of 1928, there were 15,128 miles of airways in operation, with two-thirds of this mileage equipped for night flying. Twenty-two companies were operating 33 air mail lines under contract with the Post Office Department. There were 294 single and multi-engined planes in service. The mileage flown was 10,472,024 miles as compared with 5,242,839 miles in 1927. There was a similar increase in mail poundage. In 1927, the air lines carried 1,222,843 pounds of mail. In 1928, they carried 3,632,059 pounds. In 1927, 12,594 passengers were flown on regular scheduled service. In 1928, they numbered 52,934.

The tremendous increase in air mail poundage in 1928 was due to the decrease in postage, effective on August 1, from 10 cents to 5 cents for the first ounce. Many authorities predict that in time all first class mail will be carried by air, at the ordinary postage of 2 cents an ounce.

The appeal of time saving by the air mail is irresistible to business men. Air mail makes pos-

sible tremendous savings in interest on cheques and bank drafts. It is estimated that between $8,000,000,000 and $9,000,000,000 of such valuable paper will be carried by air in 1929.

The Night Transcontinental Service inaugurated on May 1, 1929, will give all cities on the transcontinental route twice-a-day service in either direction. The flying line between New York and San Francisco will now be only 32 hours. A letter mailed in New York or Los Angeles on Monday evening will be delivered on the other seaboard on Wednesday morning.

In the development of the night air mail much credit is due to the Department of Commerce, which has set up its powerful aerial beacons over immense distances, and is helping to give pilots weather service and other aids in navigation.

Airplane Manufacture. There has been an equally rapid expansion in airplane manufacture. After the war the surplus of war material purchased very cheaply for commercial purposes effectually prevented the construction of commercial planes. In 1921, not a single commercial airplane was built. In 1928, more than 5,000 commercial planes were built and 2,087 engines for commercial purposes. The retail market of this commercial production was in excess of $27,000,000. With the production of military airplanes and of spare parts, the total value of airplane manufacture was more than $75,000,000, this making airplane manufacture one of the great industries of the country.

Private Flying. A most gratifying sign of the growth of American aviation in 1928 was the increase in private flying. At the end of the year the Department of Commerce listed 4,844 licensed planes, and of this number, 3,000 were privately owned either by individuals or by corporations using them for private purposes. The most conspicuous private flyer was Colonel Charles A. Lindbergh, who, scorning to use trains or steamships, covered 65,000 miles in the year, flying to Central and South America, and crossing the continent some ten times. Several country flying clubs were formed during the year, and the movement promises to grow very rapidly. Members of flying clubs will be part owners of good light planes, and will be able to fly where they will at a cost not greater than involved in the operation of an automobile.

Other Peace-Time Work of Aircraft. Besides its work in carrying mail, freight and passengers, the airplane is rendering many industrial services. The United States Government has used airplanes for spraying poison to kill mosquitos in their breeding haunts, in killing caterpillars, and in destroying the gypsy moth in New England, the boll weevil in the South, leaf hoppers in the Southwest, and the coding moth in Oregon apple orchards. Cotton in Georgia has been dusted at the rate of from 200 to 1,000 acres a night, compared with not more than 30 by older methods, with one-fourth increase in crop yield; and peach trees have been sprayed against the "curl" disease at the rate of 200 acres an hour, compared with 8 by old hand methods.

News and pictures have been sent by air when other transportation was impossible, as in the case of pictures incident to the funeral of President Coolidge's father in Vermont during very heavy snow; news of the explosion at the Naval Arsenal at Dover, N. J.; of the Florida and Mississippi floods. A rush shipment of clothes from New York to Florida, of overshoes from Ohio to New York City during a great storm, of gold to Miami bankers at the time of the disaster there, of a woman suffering from lockjaw to a distant hospital, of a man suffering from gangrene to another, of food to an ice-bound tug in Lake Michigan, of antitoxin from New Jersey to New York—the list of airplane uses in such emergencies would fill a page.

For policing, exploring, rescue, reclamation, inspection, and other similar work the airplane has already been used numerous times. One man in a western state has his office in an airplane which he moves about at will and which serves also as his sleeping quarters, while he inspects hundreds of acres under his general management. In advertising by "sky-writing" the use of plane is well known. Other uses are in making aerial maps by photography and in aerial surveying. A mosaic map of New York City has been made with elaborate detail, some 620 square miles to a scale of 600 feet to the inch, so that every building, street, footpath, and automobile even are clearly shown. One township made an appraisal at a cost of only $22,000 by use of an airplane, whereas a similar one from the ground took four years and cost $80,000. For several years the United States Forest Service has maintained forest patrols, each covering about 300 miles, and in 1920 alone 35 pilots thus discovered 1,600 fires in western reserves.

Large industrial organizations have taken up the airplane seriously, using it in their business for sales purposes, advertising, and inspection trips by executives. For example, the directors of the Standard Oil Company of Indiana used a three-engine plane to fly 84,000 miles on inspection trips in one year. The Goodrich Rubber Company makes large use of planes in sales promotion work. Among other large corporations owning planes for commercial purposes are the Pittsburgh Plate Glass Company, the Royal Typewriter Company, the United Cigar Stores, etc.

Salesmen are buying planes to cover their territory more quickly. Doctors, in increasing numbers, are making their professional calls by air. New York business men use land planes and flying boats for commuting purposes. Timber companies, ranchers and planters make use of the airplane in many states.

MEMORABLE AIRPLANE FLIGHTS.

1903. Orville and Wilbur Wright each made two flights on Dec. 17 in biplane and engine both of their own construction. First successful flight in power-driven heavier-than-air machine with passenger without accident.

1904. Wright brothers made 105 flights. Best record 3 miles in 4 m. 30 s.

1905. Wright brothers made 49 flights. Best record 24 miles in 38 m.

1906. Santos-Dumont, a Brazilian, made biplane flight in France of 722 ft. in 21.5 s.

1908. Farman made best French record in biplane, 12.24 miles. Delagrange established biplane record in Italy, 10.5 miles. Glenn H. Curtiss

won *Scientific American* cup in biplane at Hammondsport, N. Y., 3,420 ft. Wilbur Wright, at Le Mans, France, won world's record and Michelin prize in his biplane, 77 miles in 2 h. 20 m. 23 s. at av. speed of about 34 miles.

1909. Record for speed: Glenn H. Curtiss. 18.8 miles in 23 m. 29 s. Rheims, France.
One man duration: Henry Farman. 144 miles in 4 h. 17 m. 53 s. Mourmelon, France.
Cross-country flight: Col. S. F. Cody. 40 miles in 1 h. 3 m. Aldershot, Eng.
Altitude: Hubert Lathan in Antoinette monoplane. 1,486 ft. Chalons, France.

1910. Labouchers first man to fly 200 miles without stop. Used a monoplane. 211.27 miles in 4 h. 37 m. at Rheims, France.
Paulham in biplane won London *Daily Mail* prize of $50,000 for flight from London to Manchester.
Morane in monoplane established world's record for speed at rate of 66.417 miles an hour. Rheims, France. Exceeded later in year by others.
Radley in monoplane flew 1 mile at 77.6 mi. an hour. World's straightaway record for monoplane to date.
Le Blanc in France flew circular course of 485 miles, 75 mi. in longest stage, in 10 d. 11 h. 55 m.
One man distance record: Maurice Tabuteauin Farman biplane.
Height: Leganeaux of France. 10,500 ft.
289.39 miles in 6 h. 1 m. 35 s. Buc, France.
Greatest speed: Le Blanc in Bleriot monoplane. 67.87 m. an hr., at Belmont Park, N. Y.
One man duration: Farman. 8 h. 23 m., 289 miles.
American records: Walter Brookins in Wright biplane, Chicago to Springfield, Ill., 175¾ miles in 5 h. 51 m. with two stops. Made 88 miles in one stage. No stop record, Arch Hoxsey in Wright biplane, 104 miles from Springfield, Ill., to near St. Louis, Mo. Ryan prize, for circling Statue of Liberty and returning to Belmont Park, N. Y., won by Moisant in monoplane. About 35 miles in 34 m. 38.8 s.

1911. Speed: E. Nieuport in Nieuport monoplane. 64.132 miles an hour. Mourmelon, France.
Duration: G. Fourny. 441.173 miles in 11 h. Buc, France.
One man distance: A. Gobe in Nieuport monoplane. 460 miles. Pau, France.
Altitude: R. Garros in Bleriot monoplane. 13,940. Parame, France.
Speed in vertical climb: T. O. M. Sopwith and R. Simon in Bleriot monoplane. 1,640 ft. in 3 m. 35 s.
Cross-country flight: Lieut. Jean Conneau in Bleriot monoplane. 1,073 miles in 58 hrs. 38 m.
E. Ely alighted on deck of a battleship and rose again from it at San Francisco.
Glenn H. Curtiss flew from water to land and land to water. First use of flying boats or hydroaeroplanes, as they were then called.
C. P. Rogers made first transcontinental flight. With many voluntary stops, this took from Sept. 17 to Nov. 5 to cover 3,390 miles.

1912. Speed record: J. Vedrines in Deperdussin monoplane, 107.4 an hour. Pau, France.
Duration: G. Fourny in Farman biplane, 628 miles in 13 hrs. 18 m. Buc, France.
Altitude for airships: Cohen at Conte, France, 10,102 ft.
Altitude: R. Garros in Bleriot monoplane, 19,032. Tunis, Africa.
Flying boats: Lieut. John H. Towers in a Curtiss machine remained aloft 6 hrs. 10 m. 35 s.

1913. Pegoud made first voluntary loop in air.
Speed record: M. Prevost, France, in Deperdussin monoplane, 126.59 miles an hour, and also 68.31 in 30 m.
Distance: M. Fourny, France, in a Farman biplane, 626.77 miles.

1914. Bleriot flew from Scotland to Norway. 4 hrs. 10 m.
Duration record: Bohm in an Albatross, with 100 h. p. Mercedes motor remained aloft for 24 hrs. 12 m. at Johannisthal, Germany.
Altitude: Oelrich ascended to 25,755 ft. Sikorsky in plane made by him at Leningrad, stayed aloft at 6,200 ft. for 1 hr. 26 m. 21 s., with 10 passengers, an impressive record for such conditions. With 16 passengers he remained aloft 18 m.

1915. No important civilian European records.
Victor Carlstrom in Curtiss biplane flew continuously from Toronto to Binghamton, N. Y., and then to New York City.
Duration in U. S.: B. I. Jones, of the U. S. Army, 8 hrs. 53 m., and with two passengers, 7 hrs. 5 m.
Altitude: J. E. Carberry, U. S. Army, 11,690 ft.

1916. Ruth Law made a non-stop flight from Chicago to Hornell, N. Y., 590 miles in 5 hrs. 45 m. Record for cross-country flying, and world record for endurance piloting by a woman.
A Curtiss *J. N.* plane rose to 16,500 ft.
V. Carlstrom made a non-stop flight of 661 M. in 5 hrs. 40 m.

1917. Germany tried to control torpedo boats by stationing airplanes above.
Distance: G. Laureati flew from Turin to Naples, 920 miles.
An Italian Caproni plane flew for 322 miles with 10 passengers.

1918. Regular U. S. air mail established between New York and Washington, D. C. New York, Cleveland, Chicago route attempted.
Loening 2-seated monoplane at Dayton, O., developed 145 miles speed, with load of 4 guns and equipment, and climbed to 25,000 ft. in record time.
Four army airplanes flew from San Diego to Jacksonville, Fla. First long trip in the United States in formation like this.
Altitude record: Major R. W. Shroeder, with Wright motor of 300 h. p. rose to 28,900 ft. Bristol, Eng.

1919. *NC-4*, a U. S. Navy flying boat plane went from Rockaway, N. Y., to Halifax, N. S., to Azores, to Lisbon, Portugal, and finally to Plymouth, Eng. Four 400 h. p. Liberty motors gave speed of 90 miles in air and nearly 60 on water. Distance, 4,116 miles. Manned by Com. A. C. Reed and crew of five.
Capt. John Alcock and Lieut. A. W. Brown, Eng. Air Forces, flew a Vickers Vimy bombing plane, with two Rolls-Royce Eagle engines, from Newfoundland to Ireland. First non-stop Atlantic crossing. 16 hrs. 12 m., 1,936 miles, av. speed 118 miles an hour. Alcock died by accident later in year in France.
Capt. Ross Smith flew a Vickers Vimy, Rolls-Royce engine plane from London to Port Darwin, Australia, 11,500 miles.
Major Macaulay, in a *DH-4*, made round trip from Americus, Ga., to San Diego, in total time of 44 hrs. 15 m., and Capt. White made non-stop flight, Chicago to New York, 727 miles at 106 miles an hour.
Farman Goliath plane carried 10 passengers from Paris to Morocco, 1,116 miles in 16 hrs. 20 m.
Altitude record: Roland Rohlfs climbed 30,800 ft. at Mineola, N. Y., in a Curtiss Wasp, with 400 h. p. motor, and later to 32,450 ft.
Army reliability record: Lieut. B. W. Maynard, with Sgt. W. E. Klein as passenger, Mineola, N. Y., to San Francisco, in 3 d. 6 hrs. 47 m., and return in 9 d. 4 hrs. 26 m. and 5 s.

1920. U. S. fire air patrol in Oregon and California, flying for a total of 1,995 hrs., discovered 464 forest fires.
Knight, in mail plane, carried 16,000 letters from Chicago to Cleveland in 2 hrs. 10 m., at average of 157 miles an hour.
Lieut. A. G. Hamilton dropped from Le-Pere plane by parachute, 20,900 ft. in 12 minutes.
Donald Hudson in Curtiss Wasp crossed Andes at 30,000 feet high.
NC-4, which crossed Atlantic in 1919, flew 6,690 miles in 129 hrs. flying time.
Monument dedicated to Wilbur Wright at Mons, France, where he made a world record in 1908.
Flights from Cape to Cairo, Africa; from Calcutta to Bombay; from Philadelphia to West Indies by U. S. Navy planes and back, 12,731

miles in 1, 192 flying hours with no injuries under very adverse wind and storm conditions; four U. S. *DH-4* planes from New York to Alaska and back, 7,000 miles.

Farman Goliath flew continuously for 24 hrs. 19 m. and 1,915 miles.

Speed record: Sadi Lecointe, France, at rate of 188 miles an hour.

Altitude: Major R. C. Shroeder at Dayton, Ohio, 33,114 feet, using 400 h. p. Liberty motor. Rendered unconscious by cold and rare atmosphere, he fell with plane 5 miles, but recovered in time to land safely.

1921. Larson all-metal monoplane secured world's endurance record.

Helium first used instead of hydrogen in the U. S. Navy *C-7*, a "blimp" of 181,000 cu. ft. gas capacity, at Hampton Roads, Va.

Helium has advantages of being inflammable and of not losing its value by remaining long in a gas bag.

Pulitzer Prize record: Bertrand Acosta at Omaha, Nebr., flew 153.595 miles at rate of 176.75 miles an hour in a Curtiss-CD-12 plane of 400 h. p.

Altitude record: John A. Macready in La Pere biplane, 37,800 feet (40,000 officially corrected). Dayton, O.

Parachute record: Sgt. Encil Chambers, 26,000 ft. descent in about 18 m., first 500 before silk parachute opened. Lawton, Okla.

1922. Pilotless airplane successfully flown in England, and 300 h. p. Voisin biplane in France directed by Hertzian waves.

Lieut. J. H. Doolittle, U. S. A., Atlantic to Pacific, in 20 h. 20 m., with one stop at Kelly Field, Texas for fueling.

Capts. Sacadura and Coutinho, after hardships and a cidents, completed flight from Portugal to Brazil.

Speed record: Russell L. Maughan at Mt. Clemens, Mich., at 248.5 an hour, unofficial.

Endurance: Lieuts. John A. Macready and Oakley G. Kelly, U. S. A., in Fokker monoplane, at San Diego. 35 hrs. 18 m.

Non-stop: Lieuts. Macready and Kelly, San Diego to Indianapolis, in *T-2* army monoplane, 2,060 miles.

Altitude: Lieut. Leigh Wade and two passengers, 33,350 ft.

Experiments with gliders and helicopters continued. World's glider endurance record: M. Maneyrolle in Peyret tandem monoplane.

Berliner helicopter at College Point, Md., indicated the possibility of using the same power plant and units for both upward and forward motion of a plane.

M. Pescara in France with a helicopter secured vertical motion by revolving two horizontal wings, and horizontal motion by means of a propeller.

1923. U. S. held officially 33 out of 42 world aviation records.

Non-stop record: Lieuts. John A. Macready and Oakley G. Kelly, in a Fokker Army *T-2*, flew from Roosevelt Field, N. Y., to San Diego, Calif., 2,516 miles in 26 hrs. 50 m. 48.2 s.

Speed: Lieut. J. A. Williams, U. S. N., officially timed by electricity at Mitchell Field, N. Y., 266.6 miles an hour in a *NC* (Navy-Curtiss) racing ship.

Refueling record: Capt. L. H. Smith and Lieut. J. P. Richter at San Diego. Remained in air 37 hrs., 15 m. 15 s. Furnished with 687 gal. of gasoline, 38 of oil, and 4 hot meals in air. Later they flew in one day from the Canadian to the Mexican border, including a non-stop stage of 1,300 miles.

Altitude: Sadi Lecointe in a Nieuport plane, 36,564 ft. France.

Flying boat (hydroplane): Jean Laporte, 18,159 ft. France.

1924. U. S. globe-circling flight. Each manned by a pilot and mechanic, four planes started across the Pacific. Of these, the *Seattle* struck a mountain and wrecked in Alaska, and the *Boston* had to discontinue at the Faroe Island off Scotland on the return. The *Chicago* and *New Orleans* completed the trip in 363 flying hours, 26,346 miles, between Apr. 6 and Sept. 28. Itinerary included Vancouver, the starting and finishing point, Alaska, Shanghai, Bangkok, Calcutta, Bagdad, Constantinople, Vienna, London, Iceland, Greenland, Boston, New York, Washington, and then across to Chicago, Omaha, Dallas, San Diego, San Francisco to the starting point. Lieuts. Eric H. Nelson and John Harding, Jr., piloted the *New Orleans*, and Lieuts. Lowell H. Smith and Leslie P. Arnold piloted the *Chicago*.

World endurance record: Coupet and Drouhin, 37 hrs. 58 m. 10 s.

Speed: Warrant Officer Bonnet, France, 278.48 miles an hour.

Speed: Lieut. Russell L. Maughan, U. S. Army flyer, on a third attempt, made a "dawn to dusk" flight from Curtiss Field, N. Y., to San Francisco, 4 a. m. Eastern time to 9:38 p. m. Pacific time—21 hours, 48 m. 50 s. for 2,670 miles. With five stops en route, the actual time in the air was only 17 hrs. 52 m. Contrast this with the first transcontinental flight by Rogers in 59 days with 68 stops and a longest single span of 133 miles to 575 for Maughan.

Helicopter record: Pescara in his machine, 2 propellers, Hispano-Suiza engine of 180 h. p., in France, 2,414 ft.

1925. Attempting to reach the North Pole with two flying boats, equipped with Rolls-Royce motors, Capt. Roald Amundsen and Lincoln Ellsworth, an American, were forced down at 88 degrees north and 10 west. With great difficulty they released themselves from the ice.

Donald B. MacMillan and party of eight, using three Loening amphibion U. S. Navy planes, were able to explore 30,000 sq. miles of northwest Greenland and Ellsmere island, securing much scientific data.

De Pinedo, with a Savoia amphibion flying boat, made a round trip to Australia, by way of India and Siam, returning by way of Japan, covering 34,500 miles.

Air line distance record: Com. John Rodgers and Lieut. Byron Connell, of U. S. Navy, in a *PN-9* plane, with 2 500 h. p. Packard engines, from Pablo Bay, Calif., till forced down near Hawaii, 1,730 nautical miles.

Duration and distance: Drouhin and Landry, in a Farman biplane with 450 h. p. motor, France. 2,734 miles in 45 h. 11 m. 59 s.

Speed: Lieut. J. H. Doolittle, Bayshore, N. Y., to Baltimore, Md., 245.7 miles an hour.

Duration for seaplanes: Lieuts. C. H. Schildhauer and J. R. Kyle, U. S. Navy *PN-9* with 2 500 h. p. Packard engines, 28 h. 35 m. 27 s.

Gliders: Com. Massaux in Poncelot Vivette glider at Vauville, France, 10 h. 19 m. 43.4 s.

1926. Com. R. Franco, in a Dornier Wal flying boat, flew by stages from Palos, Spain, to Buenos Aires, Argentine, 6,232 miles in 12 days. Noted for "long jumps" (five of the seven above 800 miles each), for freedom from serious accident, and for average daily speed.

Alan J. Cobham flew a de Havilland plane from Edgeware to Cape Town, South Africa, and return in about 170 flying hours, 16,130 miles. He beat the English mail steamer *Windsor Castle* on the return trip by two days, though he covered 3,000 more miles, and spent 15 days in 26 stops on the ground en route.

Alan J. Cobham also flew from London to Melbourne, Australia, and return, 26,000 miles in 320 hours actual flying time, using same plane as in his London to Cape Town flight.

Other distance flights were, Paris to Mesopotamia, non-stop, for 2,700 miles in 26 hrs. 30 m.; Paris to Omsk, Siberia, non-stop, for 2,937 miles in 29 hrs.; Paris to Djask, Persia, non-stop, for 3,415 miles in 32 hrs.; and New York to Buenos Aires, Argentine, by Bernardo Duggan, in a seaplane, for about 9,376 miles, with delays due to accidents, in actual flying time of 114 hrs.

Com. Richard Byrd and Floyd G. Bennett, in a Fokker three-engine plane equipped by the Ford Company and named the *Josephine Ford*, flew from Spitzbergen to the North Pole and back, 1,550 miles, in 16 hrs. The new

Bumstead sun compass directed their course precisely.
Two airplanes, with engines running were launched from the British dirigible *R-33*.
U. S. Navy Officers, in five amphibian planes, made a good-will tour of Mexico, Central and South America, covering 22,106 miles in 273 hrs. 15 m. actual flying time.

1927. Dole race to Hawaii from Oakland, Calif., won by Arthur Goebel and W. V. Davis in 26 hrs., 17. m., and 33 s.
Glider distance record: E. Chattanes in a *GO-1* glider, near Varese, Italy, 38,474 ft.
Charles A. Lindbergh flew alone from Roosevelt Field, New York, to Paris by way of Newfoundland, Ireland, and England, making a non-stop record of 3,610 miles in 33 hrs. 30 m. Average speed, 107.5 miles per hour.
Com. R. E. Byrd, with three companions, made record transatlantic flight, New York to France, 3,477 miles in 46 hrs. 6 m. Altitude record: R. Donati, in Italy, 38,792 feet.

1928. Record solo and other flights from England and California to Australia.
Capt. G. H. Wilkins and C. B. Eielson flew from Point Barrow across the Polar Sea to Spitzbergen, 2,200 miles in 20 hrs. and 30 m. Later they flew across the Antartic regions.
Juan de la Cierva flew his autogiro from London to Paris.

1929. Com. R. E. Byrd, with two aides, flew across the South Pole, giving Byrd the unique distinction of flying over the Atlantic and over both Poles.
A. H. Orelbar in England established record of 357.5 miles an hour. Col. and Mrs. C. A. Lindbergh made valuable aerial photographs of western pueblos, and of ancient ruins in Mexican jungles.

1930. Led by the Italian Air Minister, 14 Italian seaplanes flew to Brazil, then to the United States, and back home by the northern route. As one of his many records, Capt. F. M. Hawks, flew from Los Angeles (with three stops) to New York in 11 hrs. 47 m. flying time.

1931. Wiley Post and Harold Gatty circled the globe in 8 days 51 m. but only 4 days real flying time. Magellan, ending in 1522, took 1,083 days; Drake 31 less in 1580; Nelly Bly, 72 in 1889; and J. H. Adams 35 in 1913.
Amelia Earhart flew her autogiro from Newark, N. J., to the Pacific and return, 11,000 miles in 150 hours.
U. S. Army planes demonstrated strength and skill in flight from the eastern coast to Chicago and return—672 craft, flying nearly a million airmiles without mishap.

1932. Many records were broken—chief being flight of Amy Johnson Mollison from England to Cape Town; a new altitude record of 43,976 feet by Capt. Cyril Unwins in England; and Capt. Roscoe Turner broke all records from Pacific to Atlantic.
Amelia Earhart, from Newfoundland to Ireland, was first woman to fly solo across the Atlantic, in 13 hrs. 30 m. Congress gave her a Distinguished Flying Medal.

1933. Wiley Post, in first solo flight around the world, 15,600 miles in 11 hops, 7 days and 18 hrs., lowered his and Gatty's record by 21 hrs.
At 45 C. below zero and 30,000 feet in the air, two planes secured remarkable photographs in circling Mount Everest.
Col. and Mrs. C. A. Lindbergh crossed the north Atlantic by Greenland, then down to Africa, and back by south Atlantic to Brazil.
Col. Roscoe Turner broke all sustained speed records, covering 2,520 miles from Los Angeles to New York, in 9 hrs. 50 m. actual flying time, at average of 271 miles an hour.

1934. French fliers discovered ancient city, perhaps of Queen of Sheba, with 20 towers and temples plainly visible, in the jungles of Africa.
Soviet pilots rescued 102 Russian castaways of Wrangle Island expedition on moving Polar ice floes.
Pres. Roosevelt cancelled all airmail contracts, turning the mails over to Army pilots. After several deaths and other casualties, private firms were again allowed to bid.
Richard du Pont piloted a glider from Elmira, N. Y., to Somerset, N. J., 155 miles, a record for gliders, and later he also established a record height, 6,244 feet.
Maximum speed for 3 kilometers (1864 miles), Francesco Agello, Italy, Oct. 23, at 440.6 miles per hour.

1935. D. W. Tomlinson, in 11 hrs. 6 m., broke transcontinental transport plane records, and also eight world records.
Wiley Post flew 2,250 miles in 8 hrs. 4 m., at average of 279 miles an hour.
Piloted by an English aviator for the Italian Navy, an autogiro took off from an ordinary cruiser, and landed on it again.
Al and Fred Key established endurance flight record of almost 27 days, covering over 50,000 miles.
World altitude record, Anderson and Stevens, U. S. A., Nov. 11, at 22,066 meters (72,394.8 feet).

1936. Capt. James A. Mollison, Atlantic time record, from Harbor Grace, Newfoundland to Croyden, England, Oct. 29, 2300 miles, in 13 hrs. 17 min., at 177 miles per hour.
China Clipper initiated trans-Pacific regular service, from Alameda, Calif. to Manila and return, 8200 miles, going Oct. 7 and return, Nov. 22.

BALLOON AND AIRSHIP RECORDS.

1783. Mongolfier brothers made the first balloon and de Rozier first navigated one as pilot.

1785. J. P. Blanchard, a Frenchman, with Dr. John Jeffries, an American, as passenger and backer, crossed by balloon from Dover, England, to France. Prof. Charles used hydrogen for inflation.

1821. Charles Green first used coal gas for inflating balloons.

1836. Green, Robt. Holland, and Monck Mason flew 500 miles from London to Duchy of Nassau, Holland, in 18 hrs. A balloon was called a "nassau" afterward.

1852. Henri Giffard developed an airship with two propellers and a rudder.

1862. Glaisher and Coxwold made unofficial record ascent of about 7 miles. At 29,000 Glaisher became unconscious, and Coxwold nearly so later, pulling the valve rope with his teeth to let out the gas.

1870. Duel between French and German balloon, probably first in warfare.

1870. Balloon with two pilots driven from Paris to Norway, 600 miles in 13 hrs.

1872. Depuy de Lome completed a "dirigible" balloon with enormous propeller managed by eight men.

1884. Capts. Krebs and Renard made several trips in their airship.

1897. A. S. Andrée, of Sweden, scientist, with two companions, lost in attempt to reach the North Pole by balloon. Their fate was unknown until their bodies were discovered in 1930 on White Island.

1900. Count F. von Zeppelin made his first rigid airship.

1900. Count de la Vaulx flew a balloon from France to Russia, 193 miles in 35 hrs. 45 m.

1901. Santos Dumont, a Brazilian, won a prize of 4,000 pounds for successfully circling the Eiffel Tower, Paris, after several attempts. Built 14 dirigibles and several airplanes at his own expense.

1901. Dr. Surig and Prof. Berson, Germany, ascended 35,600 ft. in a balloon, a record for all aircraft till 1921, and for balloons till 1927.

1906. Count F. von Zeppelin navigated a rigid airship for 200 miles in 8 hrs.

1907. English airship, *Nulli Secundus*, flew over London at 30 miles an hour.

1908. Col. Schaesk made record of 72 hrs. from Berlin to coast of Norway.
A balloon flew from England to Russia, 1,117 miles in 31 hrs. 30 m.

1909. Duration record in U. S.: Harmon and Post, St. Louis to Edina, Mo., 48 hrs. 26 m.

1910. Walter Wellman, with four companions, in non-rigid *America*, rescued in mid-Atlantic by passing boat. Their balloon disappeared in air.

1911. Lahm and Hart, American balloon race, flew 480 miles in 22 hrs. 26 m.
The Zeppelin Company inaugurated passenger service, which by 1914 had carried 34,000 people without mishap.

1912. Emile Dubonnet flew from France to Russia in one day, 1,216 miles.
Rumpelmeyer established world's record by floating from Paris to Russia, 1,492 miles. H. Kaulen, Germany, established duration record of 87 hrs. in a balloon.

1914. Berliner balloon established record of 1,896.9 miles.

1917. A Zeppelin made a non-stop flight of 4,295 miles from Bulgaria to Central Africa and return, in 95 hrs., at av. speed of 57 miles.

1918. Of 67 Zeppelins used in World War, only 10 survived—34 lost by accident, 17 by enemy attack, and 6 by capture.

1919. The English *R-33*, of Zeppelin type, with 32 aboard, flew from near Glasgow to Mineola, N. Y., in 108 hrs. 12 m., at av. speed of 33.25 miles. Returning in 72 hrs. 3 m.
Goodyear dirigible, U. S. Navy *C-5*, flew from New York to Newfoundland, 1,115 miles.

1919. Two Zeppelins in less than five months carried 2,380 passengers, 11,000 pounds of mail, 6,600 of freight and express, and covered over 32,300 flying miles in 553 hours.

1920. *D-2*, a Goodyear airship of U. S. Army, flew from Akron, O., to Washington, D. C., 444 miles. Length 500 ft., width 58; cruising radius, 500 miles.
L-21, a Zeppelin, on trial trip, carried 85 passengers 10 hrs. at 8,200 feet altitude. Another, after assignment to Italy, the *L-120*, claimed a record of 105 hrs. flight.

1921. Small Goodyear airship (pony blimp), 95.5 by 28 ft., fitted with Lawrence 3 cyl. 50 h. p. engines, and with gas capacity of but 35,000 cu. feet, had a cruising range of 450 miles.
R-38 built by British Royal Aircraft Works for the United States, once the world's largest airship, on trial test before delivery, collapsed, exploded, and fell into the Humber River, killing 44 of crew.
Helium tried for *C-7*, a non-rigid airship; used finally in quantity in the *Shenandoah* in 1924.

1922. International (Gordon Bennett) Balloon Race won by Belgium, 852.33 miles in 25 hrs. 40 m.
Airship *Roma*, built in Italy and sold to United States, fell at Hampton Roads, Va., struck high tension electric wires and caught fire, burning to death 34 of crew of 45.

1923. French dirigible *Dixmude*, later lost mysteriously in the Mediterranean, flew 4,500 miles in 118 hrs. 41 m. without stopping.
Belgium won International balloon record for third year.

1924. National (Goodyear) balloon race won by W. T. Van Orman and C. K. Wallom, 1,072 miles in 44 hrs. 4 m. 44 s.
ZR-3, now called *Los Angeles*, with 32 aboard, flew from Germany to Lakehurst, N. J., without stop, 5,066 miles in 81 hrs. 17 m., at av. speed of 55. Atlantic crossed in 64 hrs.
The ill-fated *Shenandoah*, wrecked in 1925 in Ohio, made longest trip to date as first rigid airship built in the United States. After making numerous short test flights, it crossed from Lakehurst to Fort Worth, Texas, thence to San Diego, to Canadian border in Washington, and back to Lakehurst, a round trip of 9,317 miles in 235 hours record flying time. Moored to improvised masts en route and subjected to almost every condition of navigation and weather.
Duration and distance: both won by Georges Cormier, France, 22 hrs. 34 m., and 496.69 miles.

1925. *Los Angeles* made round trip to Bermuda and back, and moored successfully to *U. S. Patoka*, only ship afloat with mooring masts for such craft.
International balloon race again won by Belgian pilot, 835.7 miles.
Shenandoah wrecked in a line storm near Caldwell, Ohio.

1926. W. T. Van Orman and W. W. Morton, in a *Goodyear* balloon, won both the International (Gordon Bennett) and the National (Goodyear) records for the season. International record, 534.9, using for inflation 60% water gas and 40% hydrogen, national record 848 miles.
Capt. Roald Amundsen realized his life-long ambition to see the North Pole as well as the South, which he visited in 1911. With Lincoln Ellsworth, an American, and Col. Umberto Nobile, as commander, with a crew of 19 men, Amundsen dashed across the Pole from Spitzbergen to Teller, Alaska, 75 miles northwest of Nome, 3,400 miles in a non-stop flight lasting 71 hrs.

1927. Capt. H. C. Gray, U. S. Air Service, attained an altitude of 28,510 feet in a balloon at Scott Field, Ill. Lost his life by failure of oxygen supply.

1928. Italian semi-rigid airship, after circling North Pole, was wrecked on return, and most of crew were rescued after a month on the ice. (See biographies of Nobile and Amundsen).

1929. The *Graf Zeppelin* in 21 days circled the world.

1930. The English *R-101*, on maiden trip to India, exploded over France, killing all but seven aboard.

1931. Prof. Auguste Piccard and Charles Kipfer, in aluminum sphere, attached to a balloon, ascended to 51,775 feet, a new record, bettered in 1932 by almost 2,000 feet.

1932. The *Graf Zeppelin*, on June 28, completed her 250th flight, 261,000 miles, carrying in all 16,000 persons, 13 tons of mail, and 33 of freight.

1933. The *Graf Zeppelin* made new record of 72 hrs. 40 m. Germany to Brazil.
U. S. Navy, *Akron*, largest aircraft afloat, wrecked by storm off New Jersey, only 4 of crew of 78 being rescued.

1934. Three Russian balloonists, having risen to 72,178 feet, were killed in the descent by smashing of the gondola.
U. S. *Macon* made record trip across country, Sunnyside, Calif., to Miami, Fla., 54 hrs. 48 m.

1935. *Macon* wrecked off coast of California.

1937. German airship, *Hindenburg*, burned at landing field, Lakehurst, N. J., on May 7, with 36 killed of total of 99 aboard.

TERMS USED IN AERONAUTICS

(Standardized by National Advisory Committee for Aeronautics, but here simplified for general readers. Terms are explained only with regard to their use in aeronautics.)

Aerodynamics. Science treating of the flow air and the forces exercised on solid bodies by air in motion.

Aeronautics. Knowledge and skill applied to flight of aircraft.

Aerostat. Any aircraft lighter than air, like balloons and airships.

Aerostatics. The science of lighter-than-air craft.

Aerostation. Art of managing lighter-than-air craft.

Aileron. Hinged or pivoted surface placed at rear outer part of a wing, which, on being moved, tends to impart a rolling movement to the airplane.

Aircraft. Any device designed to fly through the air, including balloons, airships, and airplanes.

Airfoil. Any surface intended to be projected through the air so as to bring about useful dynamic reaction or support.

Airplane. Craft heavier than air, fitted with wings, propelled by an engine, and supported by dynamic action of the air upon wings and other exposed parts.

Airplane, pusher. Plane having propeller in rear of the main surfaces or wings.

Airplane, tractor. Plane having propeller in front of the main surfaces or wings.

Airport. Any place on land or water fitted for landings and takings off of aircraft, with facilities for the repair and refueling of such craft, and for the comfort of passengers.

Airship. Aircraft of the lighter-than-air type with propelling system and some means of controlling the direction of motion, differing in these regards from a free or merely floating balloon.

Airships, types of. Non-rigid airships are held to form by the internal pressure of gas bags and balloonets. The rigid is held in shape by a metallic internal structure. The semi-rigid combines elements of both types, combining a rigid keel with internal gas pressure to maintain their form.

Air speed. The rate of motion of an aircraft relative to the air. The air-speed indicator shows the rate of motion relative to the air.

Airway. Air route between ports or landing places.

Altimeter. A device that indicates the height of aircraft above sea level, and is based on the principle of the aneroid barometer.

Amphibion. An airplane designed to rise from either land or water and to alight on either.

Anemometer. An instrument designed to measure the speed of the air current or airstream.

Angle, critical, drift, etc. The critical angle is the angle of attack or incidence at which an airfoil attains its maximum lifting capacity. The drift angle is the angle between the longitudinal axis of an airplane and its path relative to the ground.

Apparatus, water-recovery. Device carried on airships for condensing and so recovering the water contained in gases exhausted from the internal combustion engines. By saving this water and maintaining the weight of the airship at a constant value, in spite of fuel consumption the release of gas from time to time is obviated.

Axes of aircraft. Fixed reference lines indicating the position of the plane from right to left, front to back, or up and down, with regard to normal or some fixed position.

Bag, gas. Skin or rubber container of gas in a balloon, or airship.

Ballast. Any substance, like sand or water, carried for release from a balloon or airship when it is necessary to rise higher. Conversely, gas is released from the gas bag or bags when it is necessary to drop to a lower level.

Balloonet. Bag containing air, placed within the gas bag itself, for the purpose of increasing the pressure within the balloon and keeping it from denting, crumpling, or otherwise getting out of a required shape. Air can be let out of the balloonet for ascent, or into it by means of an air scoop for descent. Must not be confused with gas bag, which contains gas only, whereas the balloonet contains air only.

Balloon. Any aerostat, or craft depending on buoyancy for its support and not provided with mechanical means of locomotion.

Balloon, free. Usually round in shape, caused to rise by release of sand or water bags, and caused to sink by release of gas from the bag. Its direction of flight depends on the wind.

Balloon, dirigible. A balloon that can be steered by an operator. Term should not be applied to an airship.

Bank. To incline an airplane sideways. To right bank, then, is to incline the airplane by forcing the right wing downward. As a noun, bank describes the position of the plane when its lateral axis is inclined to the earth's horizon.

Bar, suspension. One to which ropes are attached for supporting below the basket or carrier for passengers, ballast, cargo, etc. of a balloon.

Basket. Carrier, usually of a free balloon, for passengers, etc.

Biplane. An airplane with two main supporting surfaces one above the other. A triplane has three, a quadruplane four surfaces and so on, but more than three surfaces are rarely used.

Blimp. Slang name for a small non-rigid airship.

Body. The fuselage, or hull of an airplane, including the place for pilot, passengers, cargo, apart from wings and tail of the plane. A short enclosed shelter for passengers or power units is called the nacelle.

Buoyancy. Upward air force of an aerostat or lighter-than-air craft. It equals the weight of air displaced minus the weight of gas contained in the bag.

Cabane. Usually applied to framework for supporting the wings at the fuselage or hull of an airplane.

Capacity, gas. The volume of gas contained in the collection of gas cells of a balloon or airship. It varies under different conditions of pressure and inflation as determined by the operators or by changes in external air forces.

Car. Part of an airship designed to carry passengers, cargo, or supplies. It may be suspended or placed close up against the buoyant portion or main envelope. Name does not apply to parts for similar purpose fitted as a keel of a rigid or semi-rigid craft.

Cell, gas. One gas container or bag fitted in a rigid airship. The number varies from one or a few to a score or thirty.

Cloth. Untreated fabric before it is coated with some preparation for use in aircraft.

Cockpit. Space for pilot and passengers; when housed or enclosed, it is often called a cabin.

Compartment, control. Space or compartment of an airship where the operating machinery or controls are located. Like the pilot house of a ship.

Controls. Any devices for the pilot to use in directing the speed, direction, and attitude of an aircraft or its power plant.

Control stick. Often called "stick" simply. Vertical lever by which both the lateral and horizontal controls are operated. Moving forward or backward the stick controls pitching movements; moving the stick to one side or the other controls the rolling movements.

Control surface. A movable part of airfoil which the pilot moves to change the attitude of the airplane or airship.

Crow's-foot. System of diverging ropes in a non-rigid airship that distribute the pull or force of a single rope. By such an arrangement strands of rope or cord can be cemented to a fabric surface.

Deflation. Act of releasing or removing gas from the balloon or air from the balloonet.

Diaphragm of balloonet. Fabric partition within the envelope separating the gas compartment from the air compartment or balloonet in a rigid or semi-rigid aircraft.

Dirigible. As applied to balloon means steerable or manageable by man. Should not be applied to an airship.

Displacement. Weight or volume (mass) of air replaced by gas used for inflation.

Dive. Steep descent, with or without motive power, in which the speed of the craft exceeds that of the maximum in horizontal flight. A nose dive is one at an angle approaching 75 degrees or more with reference to an upright position or angle of 90 degrees. See glide.

Dope. Liquid substance applied to surface of an airplane cloth to make it stronger, air-proof, or tighter; or liquid applied to a rubberized airship fabric to increase gas-tightness.

Drag. Component parallel to the relative wind of the total air force of an aircraft or airfoil.

Drift. The lateral or side speed of an aircraft due to air currents.

Duralumin. An alloy of aluminum with small percentages of copper, manganese, and magnesium, now much used for airship and airplane construction. Has great strength for light weight.

Dynamics. Science of forces both in equilibrium and motion, and of the relative effects produced by increasing motion.

Dynamic factor. Ratio between load carried by

aircraft or any part of one when maneuvering as compared with the basic load in normal flight.

Elevator. Movable auxiliary airfoil, which gives a pitching motion to the aircraft.

Endurance. Maximum time an aircraft can remain in the air at a given speed and a given height.

Engine, rotary. An engine with cylinders arranged radially and moving round a common fixed crankshaft.

Envelope. Outer covering, usually treated fabric, of an aerostat. It may contain gas, or may enclose other gas bags or cells; and it may contain air cells or balloonets.

Fabric. Cotton, silk, or other cloth treated by rubber and other dope from which airship and airplane envelopes and wings are made.

Fabric (gold beater's skin). Layer of light, fine cloth like cotton, inside of which goldbeater's skins have been cemented and covered with varnish. It is used for gas cells of rigid airships.

Factor of ultimate safety. Ratio of ultimate safety of any part to the total load or strain it is likely to bear in actual use.

Fin. Some fixed vertical surface attached to increase stability, like a tail fin or skid fin, etc.

Flap. Drip flap is a ring of fabric arranged around the envelope so that it sheds water as eaves on a house. Pressure flap is a fabric valve in the envelope to allow air to pass in and out rapidly to stabilize the pressure and keep the balloon or airship on a level course.

Flying boat. Type of seaplane having a hull or hulls which shelter the personnel as well as providing flotation. On the ordinary or center type of hull, lateral stability is provided by tipfloats placed under the wing.

Free balloon. Ordinary round balloon from which ballast and air can be released, but dependent on the wind for velocity and direction.

Fuselage. The structure, roughly streamline in form, which carries passengers, engine, fuel, etc., and to which the wings and tail of an airplane are fixed.

Gap. Perpendicular distance from upper wing to the one below.

Glide. A descent or to descend at an angle without power or in a craft without an engine, according to laws of gravity.

Glider. Aircraft similar to an airplane, but lacking an engine or power plant.

Ground-speed meter. An instrument for measuring the speed of an aircraft with regard to the ground.

Hangar. Any shelter for housing aircraft, but more accurately applied only to heavier-than-air craft.

Height, pressure. Height or altitude at which gas cells of a rigid airship are full, or the gas bag of a non-rigid balloon is completely filled with gas.

Helicopter. Any aircraft supported in the air entirely by force or thrust produced by rotating airfoils. Has the advantage of rising vertically or nearly so, and for this reason requires only a small landing field.

Hull. Main framework of an airship, including gas cells; part of a flying boat (seaplane) used for housing passengers and cargo and for providing flotation on the water.

Inclinometer. An instrument showing the attitude of an aircraft, whether with regard to the vertical plane through the fore-and-aft axis, or the lateral as to side dip on left or right, or in both planes.

Indicator. One of various instruments designed to indicate the fullness of gas cells, the speed of an airplane, etc.

Keel. Of an airship, the structure at the bottom of the hull providing strength against disabling elements and also a means of distribution of the loads along the hull.

Kite. Any aircraft heavier than air, held by a towline and kept aloft by relative strength and movement of the wind.

Landing gear. Understructure which supports the aircraft on land or water or keeps it from damage when landing or taking off. The common forms are boat type, float type, skid type, and ski type. Some amphibion (land and water) airplanes have combinations of floats or boats with skis or wheels.

Landplane. Airplane capable of landing only on the ground.

Lift. Component or part of the total air force exerted on an aircraft, or some part of it as specified, which is perpendicular to the relative wind and in the plane of symmetry.

Lift of a gas. Difference, under same conditions, between density of the gas and of air. The dynamic lift is that impressed on an aerostat by aerodynamic forces.

Lift, useful. Net lift available after deducting weight of the craft, for crew, fuel, oil, cargo and passengers, and equipment.

Line. Any rope used to grasp objects, to moor the craft, to steady it, to stabilize it, or control it.

Load. Useful load is the weight of crew, fuel, oil, cargo, passengers and equipment. Full load is the weight of the craft plus useful load. Basic load is load on an aircraft at rest or in steady flight. Pay load is the weight or useful load from which revenue is derived, such as passengers and freight.

Lobe. An air or gas inflated bag fitted at the stern of some aircraft like a kite or balloon to give it stability.

Maneuver. To change the attitude or relative positions of an aircraft at will of the pilot.

Monoplane. An airplane of but one main supporting surface, which may be divided into two parts by the fuselage.

Mooring mast. Tower to which an airship may be moored at the top. Some have ways for passengers to go up and down and piping for gas and other motor supplies.

Mooring, three-point. System of anchoring an airship by ropes going to three stakes arranged in the form of a triangle. Takes the place of a mooring tower.

Multiplane. Airplane with two or more surfaces placed one above another.

Nacelle. Enclosed shelter for passengers or power plant, usually not as long as the fuselage, and not supporting the tail.

Net. Of a balloon or airship, rigging made of ropes and heavy twine around the envelope and supporting below the weight of the basket which carries the crew, passengers, ballast, and other equipment.

Nose dive. See dive and glide.

Nose heavy. Condition of an airplane in normal flight whereby the craft would go into a nose dive, or the nose would drop, if the longitudinal controls were released or broken.

Ornithopter. Heavier-than-air craft supported and propelled by the flapping of wings. Long the dream of inventors, before the modern airplane was made.

Over-all length. Total distance from extreme point of propeller to extreme end of tail of any aircraft, especially of an airplane.

Pancake, to. Method of leveling off an airplane at a higher point than normal and descending to earth on a steep path, with wings at a large angle of incidence.

Panel of an aerostat. Unit piece of fabric of the envelope or outer covering.

Panel, rip. Strip fitted into upper part of envelope, which may be ripped out when immediate deflation is desired.

Pontoon. Name formerly used for a float.

Proofing. Material incorporated into a fabric to increase its strength and to prevent leakage of gas through it.

Propeller. Rotating mechanism or blade which provides the propulsive force for an airship or airplane. It operates on the air as the propeller of a boat does on the water.

Pusher airplane. One with propeller mounted in the rear of the main supporting surfaces.

Quadruplane. An airplane with four surfaces, placed one above another.

Range. Distance an aircraft can cover without refuelling or landing.

Rate of climb. Upward or vertical velocity with reference to air.

Rigging. Attachment and adjustment of car, rudders, valves, controls, and other elements of an airship; or the similar arrangements of parts of an airplane.

Rope, drag. Any rope used to act as brake or variant ballast of a balloon in making a landing; on airships a similar device to help the crew in landing or hauling down the craft.

Rudder. Movable part or airfoil, usually attached to end or tail of an aircraft, to assist the pilot in directing or yawing the craft.

Sag. Distortion of airship so that both ends rise higher than the middle.

Seaplane. Any airplane designed to alight on the water and rise from it. Name applies to both boat and float types, though the latter is often designated as flying boat.

Skid. Runner used as part of landing gear to enable the aircraft to land, or to taxi over the ground. Tail skids and wing skids protect the tail and wings from harm by hitting the ground.

Sky writing. Making letters or figures from smoke emitted by the airplane as it is maneuvered for this purpose.

Slipstream. Stream of air driven astern by the propeller.

Soar. To make sustained free flight without self-propulsion.

Span. Lateral dimension of an airfoil; maximum distance across an airplane parallel to lateral axis and including the ailerons, or movable auxiliary surfaces.

Spin. Maneuver consisting of a combination of roll and yaw with the longitudinal axis inclined steeply downwards.

Spiral. Maneuver of airplane in which it descends along a path like a giant screw.

Stability. That property of a body which tends to cause it to return to a normal position after it is displaced from such a position.

Stabilizer. Horizontal fixed airfoil that gives the airplane longitudinal stability. Called also the tail plane, because it is usually located in the rear. The fin of an aerostat is called a stabilizer.

Stall. Condition of an airplane which has lost the air speed necessary for support of control, because its wing is at too great an angle relative to the direction of motion.

Statoscope. Instrument which records small changes in altitude of any aircraft.

Streamline. Path of small part of a fluid in relation to a solid body with respect to which the fluid is moving. The term is also commonly used of such flows as are not eddying or disturbed.

Streamline flow. Steady flow past a solid body.

Surface, control. Movable airfoil or surface which the pilot can rotate to change the attitude of the airplane or airship.

Tail (airship) Same as stern.

Tail-heavy. Condition in heavier-than-air craft in which the pilot has to move the control stick forward to maintain a given attitude; otherwise, if left to itself the tail would sink.

Tail-slide. Backward and downward motion of an airplane after stalling. Sometimes incorrectly called a tail spin.

Taxi, taxy. To run an airplane over the ground as in landing or taking off, or a seaplane over the surface of the water.

Trim. Attitude of an aerostat or lighter-than-air craft relative to fore and aft horizontal plane. When the forward end is down, the aerostat is said to have "trim by the bow"; when the after end is down, to have "trim by the stern."

Triplane. Airplane with three supporting surfaces, one above another.

Valve. Any device for releasing gas and gas cells, air from balloonets, or air or gas from the envelope of an airship or balloon.

Vertimeter. Device for measuring the rate of rise and fall of an aerostat.

Volume. Space occupied, measured in cubic feet or cubic inches.

Warp. To change the form of a wing by twisting it; lateral control of an airplane was formerly achieved by warping the ends of the wing.

Weight. Variously computed as that of engine without fuel or oil, of the aircraft with or without load, of necessary ballast, or units of gas or air, of an engine per each horse power, etc.

Wing. Whole or part of supporting surfaces of an airplane, often spoken of as right wing, upper wing, etc.

Wing heavy. The condition of an airplane in which either the right or left wing would drop, were the lateral control released or broken.

Wing surface. Total area of the supporting surfaces or wings, generally expressed in square feet.

Zoom. To climb for a short while at an angle to the earth's horizon greater than could be maintained in steady flight.

PHYSICS.

Physics is the science which treats of the related phenomena of matter and energy. It is not so much a science dealing with matter or with energy alone but one that involves a study of the underlying principles which operate in this universe in which we have our being. All physical phenomena are the results of the operation of physical laws and a careful scientific investigation of these laws not only leads to a better understanding of the actual happenings in this world of ours but also enables us to make practical applications of these underlying principles with which we can conquer nature and make the world a more habitable place in which to live. To love Physics for its own sake one must either be full of a spirit of curiosity regarding our existence, or imbued with an intense desire to serve his fellow men in some such way as devising a new instrument to save the labour of man's hands or discovering a means of saving man's life from disease.

Physics has many ramifications into some other sciences such as Astronomy, Geology, Chemistry, Biology, and Medicine. This sometimes becomes so extensive as to form a separate department of study such as *astrophysics, geophysics, physical chemistry* and *biophysics.* Although originally with the ancients it was included under the study of Philosophy, it has now developed, especially during recent years, further than any other science and includes highly developed *departments such as mechanics, sound, light, heat, magnetism* and *electricity.* There is no commercial industry today nor any productive activity of man such as that of mining or farming which does not involve the **Science of Physics.** To be an efficient and productive worker today, it is essential that one studies its laws and principles. Moreover only in its development by new investigations and research can man ever hope to make any progress in solving the riddle of the universe. It is this pursuit that has produced some of the world's greatest physicists and philosophers such as Archimedes, Galileo, Sir Isaac Newton, Huyghens, Cavendish, Coulomb, Faraday, Gauss, James C. Maxwell, Sir Joseph J. Thompson, Michelson, Sir Ernest Rutherford, Millikan and many others.

DEFINITIONS OF PHYSICAL TERMS.

MECHANICS.

That branch of Physics which treats of the motions of bodies and the causes of changes in these motions. The part that deals merely with the geometrical properties of the different kinds of motion is called *Kinematics,* while *Dynamics* deals with the change in the motion produced by applied forces. Statics is that subdivision which deals with cases where although force is applied, the body remains at rest. Under Mechanics comes the systems of fundamental and derived units. The former are the units of length, mass and time and there are two systems of length and mass, namely the English and the Metric. The *derived units* include the units of *area, volume, velocity, acceleration, force, work* and *power.* These are complete in the English and Metric systems. Mechanics also includes the study of translation and rotation, work and energy, periodic motions, equilibrium, friction and the principles of machines.

Acceleration. Increase in the velocity of a body. The acceleration of a falling body, or of one dropped from a height, caused by the attraction of the earth (gravity) is 32.2 feet per second. In calculations and formulae this is represented by g.

Adhesive forces. Molecular forces which bind unlike kinds of molecules together.

Brittleness. The physical property of matter by virtue of which it tends to break readily under the influence of a sharp blow.

Capillarity. Peculiar action by which the surface of a liquid, where it is in contact with a solid, is elevated or depressed; so called because the phenomena are best seen in tubes of such small diameters that they are comparable to a hair. Also known as capillary attraction.

Center of Gravity. That point in which, if the whole mass of the body were centered, the attraction of gravity would remain unchanged. The center of gravity of a square, rectangle, rhombus, or rhomboid is at the intersection of its two diagonals; of a circle, ellipse, or regular polygon, at the center of the figure; of a semicircle, the radius multiplied by .4244 will give the distance from the center on the radius erected perpendicular to the diameter; at the center of a cube, parallelopiped, cylinder, prism, sphere, spheroid, or ellipsoid; of a right pyramid or cone, in its axis one fourth the distance from the base.

Coefficient of Friction. Constant ratio of force applied over weight.

Cohesive Forces. Molecular forces which bind like kinds of molecules together.

Density. Ratio of mass, or quantity of matter, to bulk or volume, especially as compared with the mass and volume of a portion of some substance used as a standard.

Ductility. The physical property of matter by virtue of which it can be drawn down into thinner wire.

Dynamics. Branch of mechanics which treats of the motions of systems or of particles. It regards mass, forces, constraints, velocities, and positions. It tells about the circumstances under which certain motions take place. Dynamics is divided into statics and kinetics.

Elasticity. The characteristic property of matter of returning to its original length when the forces causing extension are removed.

Elastic Limit. The point beyond which a body must not be stretched in order to have it return to its original length.

Energy. The ability to do work. *Kinetic energy* is the energy a body possesses by virtue of its motion. *Potential energy* is the energy a body possesses by virtue of its position; for example, coiled or stretched springs, bent bars, lifted weights.

Force. That which tends to impart motion to a body at rest, or to change the direction or magnitude of the velocity of a body already in motion.

Hardness. The physical property of matter by virtue of which it does not tend to be scratched readily.

Horse Power. Nominal horse power or Watt's horse power supposes a horse able to lift 33,000 footpounds in one minute; actual tests with an average horse give but 22,000 footpounds in one minute. Indicated horse power is calculated from the pressure upon the piston as shown by an indicator card or diagram.

Hydraulic Press. Application of the principle that pressure upon a body of water is communicated equally in every direction throughout the entire mass regardless of its shape. Pressure by a piston or force-pump upon a small body of water is communicated to a piston of larger area through pipes. It is used in the hydraulic *block, crane, jack, dock, hoist, elevator, punch, shears,* and for *baling paper,* hay, etc.

Hydraulics. Branch of mathematical and engineering science which treats of fluids in motion and of the application of these laws and principles to machinery.

Hydrostatic Paradox. Principle that any quantity of water, however small, may be made to balance any quantity of water however great. It is the principle which underlies the hydraulic press.

Hydrostatics. Mathematical investigation of the pressure and equilibrium of incompressible fluids.

Kinematics. Branch of mechanics, treating of motion, its *direction, velocity, acceleration,* and *composition,* but not regarding mass or constraints.

Kinetics. That part of dynamical mechanics which treats of the forces which cause or change the motion of bodies.

Lever. Rigid rod moving about a fixed axis called the fulcrum.

Malleability. Physical property of matter by virtue of which it can be hammered down into a thinner sheet.

Mass. Means the quantity of matter that a body contains, without regard to the space that it takes up. The unit of measure is the quantity of matter contained in the piece of platinum-iridium known as the standard kilogram. It is kept by the International Board of Weights and Measures near Paris, France. It is equivalent to about two and two-tenths pounds. One one-thousandth of this measure was adopted as the fundamental unit of measure and was named the gram.

Mechanical Powers. May be classed under seven heads. They are based upon two fundamental principles, viz., lever and inclined plane. They are, *lever, wedge, pulley, block and tackle, inclined plane, screw* and *toothed wheel.*

Molecular Forces. The forces of relatively great magnitude which act between molecules, and gives rise to the various physical properties of matter.

Momentum. The quantity of motion of a moving body, and is the product of the mass multiplied by the velocity.

Motion. The property in virtue of which the position of a body in space may be changed.

Physical Properties of Matter. Are *hardness, brittleness, ductility, malleability, tenacity,* and *elasticity.* These depend on differences in the cohesive forces, operating between different molecules of the substance.

Power. The branch of dynamical mechanics which treats of the study of the circumstances under which it is possible for a body to remain at rest or in equilibrium.

States of Matter. Are *solid, liquid* and *gaseous.*

Tenacity. The resistance which a body opposes to the total separation of its parts. The various kinds of tenacity are: *tenacity* in the ordinary sense, or resistance to traction; *relative tenacity* or resistance to fracture; *reactive tenacity,* or resistance to crushing; *sheering tenacity,* or resistance to displacement of particles in lateral direction; and *torsional tenacity,* or resistance to twisting.

Velocity. The rate of change of position. It considers the distance travelled and the time consumed.

Volume. Space is of three dimensions: *length, breadth,* and *thickness.*

Weight. The measure of the force or downward pull due to the attraction of gravity exerted upon all bodies.

SOUND.

A department of Physics which embraces an investigation of the nature and production of sound. This department presents the explanation of the basis of musical sounds and their sources, and the experimental methods for the determination of the velocity of sound. Various practical applications of the principles of sound have been made such as in the study of the acoustic properties of halls and the invention of acoustic aids to navigation in foggy weather and listeners for enemy aircraft and submarines. Sound travels in the air at the rate of about 1,090 feet a second at 32 degrees F. or one mile in 4.84 seconds; in hydrogen its velocity is about four times as great as in air; in liquids the velocity is greater than in air (in water about four times greater, or 4,708 feet in a second); in wood or steel from two to three miles a second. If the vibrations do not exceed 24 a second or if they exceed from 30,000 to 40,000 a second, the ear cannot detect the sound. Sound waves respond very closely to the laws of light as to *reflection, refraction* and *interference.* Sound of low pitch are caused by slowly vibrating, long sound-waves; shrill, high-pitched sounds are produced when vibrations are rapid and the sound waves are short in wave-length.

Beats. These occur when two notes of almost the same frequency of vibration are sounded together and is the effect upon the ear of vibrations set up either in the sounding-body itself or in the air or other medium.

Loop or Anti-node. Is a point of maximum displacement.

Loudness or Intensity of a Note. Depends on the amplitude of the vibrations.

Node. Is a point of minimum displacement.

Pitch of a Note. Depends upon the number of *vibrations per second.* The greater the number of vibrations the higher the pitch.

Quality of a Note. Depends on the presence or absence of overtones.

HEAT.

In this department of Physics are studied the causes and effects of heat, the measurement of temperature, and its effects, also the practical applications of expansion. Methods of measuring and comparing specific heats which is the relative amount of heat necessary to change the temperature of unit mass of a body one degree and also the quantity of heat involved in changing the state of a body are explained together with the very practical industrial applications such as refrigerating plants. Our understanding of thermal phenomena has improved considerably since the adoption of the Kinetic Molecular Theory. This considers that the temperature of a body depends on the state of agitation of the molecules of matter which compose it. In gases the motion is in nearly uniform rectilineal direction; in liquids, in irregular directions; and in solids, orbital or oscillatory. This motion is sustained in all bodies until the absolute zero point, when it ceases. The important significance is emphasized of Joule's experiment on the mechanical equivalent of heat, which demonstrated that heat is one form of energy, and that all energy is indestructible and only convertible from one form to another in a definite relation. This section also discusses the various modes of transference of heat by *conduction, convection* and *radiation* together with the applications of the same, for example in heating and ventilation systems and steam and gas engines.

Absolute Zero. The lowest possible temperature; the temperature at which the undulatory motion in all bodies would cease. It has been shown to be about −273 degrees Centigrade.

Coefficient of Linear Expansion. The ratio of the increase in length of a rod of unit length for a rise in temperature of one degree to its original length at zero degrees Centigrade.

Conduction. The flow of heat through matter in contact but not accompanied by the bodily motion of the particles of matter themselves.

Convection. The transport of heat by the bodily motion of the heated particles themselves.

Heat of Condensation. The number of units of heat required to condense unit mass of the substance without changing its temperature.

Heat of Fusion. The number of units of heat required to melt unit mass of the substance without changing its temperature.

Heat Unit. The same amount of heat necessary to raise one pound of water through one Fahrenheit degree of temperature. One pound of coal in burning yields heat enough to raise 13,500 pounds of water through one degree F. of temperature; hence yields 13,500 B. T. U. meaning British Thermal Units. This is the Engineers' heat unit.

Interference. The action of waves of water, *sound-waves, heat-waves* or *light-waves* upon one another, by which, according to conditions, the effects are either increased, diminished or neutralized. A wave is composed of a *crest* and a *trough*. If two crests come together the waves are increased; if a trough and a crest, both waves are diminished; if two troughs both are neutralized. The colors of soap bubbles, of some iridescent glass, and of mother of pearl are due to interference of light waves.

Radiation. The passage of heat energy through space without the necessary presence of matter. This is called thermal radiation.

Specific Heat. The ratio between the quantity of heat necessary in order to raise a given mass of any substance through a given difference of temperature, and the quantity of heat necessary to raise the same mass of water through the identical difference of temperature.

Temperature. The condition of a body with respect to its power to absorb heat from or communicate heat to surrounding bodies.

LIGHT.

This is a very important section of Physics, and was formerly called Optics. It deals with the physical nature of Light, and its general properties such as its transmission through material substances and also empty space. Various methods have been devised for accurately determining the velocity of light through space and different media. A great development has taken place in the study of image formation after reflection and refraction and in the many convenient applications of these principles of optics in the form of optical instruments for various purposes. This subject also includes the intensive investigations of color whether from an incandescent source, from reflection or from transmission. This has led to our present wide knowledge of the spectra of different chemical elements and compounds. Another interesting development has been the physical demonstration of the existence and the properties of invisible "light" or radiation. This has been in conjunction with the interesting experiments which have been devised to illustrate special optical phenomena such as *diffraction* and *interference* which have an important bearing in connection with a complete theory of Light. This section of Physics has been one of the most fruitful studies in uncovering to us the wonderful phenomena of nature.

Aberration. The irregularities of a ray of light unequally refracted by a lens or reflected by a mirror and not meeting at a focus; the image resulting is indistinct, distorted, or colored at the edges. Indistinct images are produced by spherical aberration; coloring, by chromatic aberration.

Angle of Incidence. The angle formed by the incident beam and the normal or perpendicular to the reflecting surface.

Dispersion. The separation of the component colors of the spectrum, from a mixed beam of light.

Focus. The point at which rays of light converge or from which they diverge.

Focal length. The distance from the center of the lens to the principal focus.

Principal focus. That point through which parallel rays of light are made to pass after reflection or refraction.

Real focus. The point from which rays of light actually diverge.

Virtual focus. The point from which rays of light appear to diverge.

Illuminated Bodies. Those which are lighted by some other source.

Index of Refraction. The ratio of the sine of the angle of incidence to the sine of the angle of refraction.

Lens. A transparent body (usually glass) bounded by curved surfaces used to cause pencils of rays to converge or diverge after passing through it. *Convex lenses* are thickest in the center and magnify; *concave* lenses are thinnest at the center. The *double-convex lens* is convex on both sides; the *double-concave*, concave on both sides. The *plano-convex* has one side convex and the other flat. The *meniscus* is shaped in section like a crescent-one side concave, the other convex. The *axis* of a lens is the line joining the centers of the curvature of both surfaces.

Light. The undulatory theory explains the phenomena of light as the result of an undulatory motion which the luminous body excites in the luminiferous ether pervading all space and the molecular interstices of all bodies. Light travels in a vacuum at the rate of 186,000 miles per second. The emission or corpuscular theory has been abandoned in favor of the undulatory or wave theory.

Opaque Substances. Are those which absorb all the un-reflected incident light.

Penumba. The region of partial shadow surrounding the umbra behind the opaque object.

Radiation. The emission and diffusion of rays of light or heat by all bodies at all temperatures. When the radiant energy of a body is capable of producing light, it is called luminous; when no light is produced, obscure.

Reflection. When a ray of light, sound or radiant heat strikes a surface and is thrown back into the medium whence it came, it is said to be reflected. The *law of reflection* is that the angle of reflection is equal to the angle of incidence; and that both of these angles lie in the same plane with a normal to the surface. Mirrors, reflectors, sounding boards, and echoes are illustrations of reflection.

Refraction. The change in direction which rays of light, heat or sound undergo when passing from a medium to another of different density, as from air to water, glass to water, glass to air, and the like. Lenses, prisms and the spectrum depend upon refraction for the explanation of the phenomena which they manifest. Double refraction is the separation of a ray into two rays unequally refracted and is especially noticeable in certain crystals.

Translucent Bodies. Those which transmit light, but through which objects are faintly distinguished; such as water, gases, and polished glass.

Transparent Substances. Those which transmit a large portion of the incident light without scattering.

Umbra. The region of complete shadow behind an opaque object.

MAGNETISM.

That branch of Physics which studies the general properties of magnets and magnetic substances. Its real scientific development dates from the experimental results of Dr. William Gilbert, physician to Queen Elizabeth, who published a book in London called "De Magnetta" in 1600 A. D. He suggested that the earth's magnetic action on a compass needle was really due to the earth itself being a magnet possibly caused by the presence of large masses of magnetic ore in the interior. This was the basis of the study of terrestrial magnetism. A new and more recent development is *electro-magnetism* which studies the magnetic effects of an electric current.

Magnetization can be produced by three methods, *single touch*, *double touch*, and *by use of an electric current*. In using the single touch the polarity generated at the point last touched or stroked by the magnetic substance is of opposite kind to that of the pole used. In using an electric current, the substance to be magnetized is placed inside a coil carrying an electric current.

Coercivity. The power of retaining magnetization in spite of any subsequent treatment.

Critical temperature of a magnetic substance. That temperature at which it ceases to exhibit any magnetic properties.

Earth's Magnetic Poles. The places at which the magnetic dip needle is vertical. They do not coincide with the geographical north and south poles.

Induced Magnetism. Temporary polarity set up in a piece of iron or steel by introducing it into the magnetic field of a permanent bar-magnet, or of a solenoid.

Lodestone. Practically the only form of a natural magnet to be found, attracting fragments of itself and setting in one particular direction when suspended. It is an oxide of iron (Fe_3O_4) and the mineral ore is called magnetite. It is irregularly distributed throughout the world.

Magnetic Declination. The angle between the geographical and magnetic meridians.

Magnetic Dip or Inclination. The angle at any point between the earth's magnetic lines of force and a horizontal plane at that point.

Magnetic Force. Mechanical force, in dynes exerted on a unit magnetic pole placed at the point. It is equal to the number of lines of force crossing unit area surrounding the point at right angles to the direction of the magnetic field.

Magnetic Hysteresis. When a magnetizable substance lags in its state of magnetization behind the magnetizing force at any instance there results a transformation of magnetic energy into heat. It is usually measured by making cyclical reversals of magnetic flux.

Magnetic Induction. The process of setting up temporary polarity in a piece of iron or steel by introducing it into the magnetic field of a permanent bar-magnet or inserting it in a solenoid carrying an electric current.

Magnetic Line of Force. A line which at every point has the direction of the magnetic force at that point. It proceeds out of the north pole of a magnet and enters in at the south pole.

Magnetic Meridian. The vertical plane in which the magnetic axis of a freely suspended magnet comes to rest.

Magnetic Saturation. That condition obtained when the metal fails to acquire a higher degree of magnetization, however, much the magnetizing power is increased.

Magnetic Storm. Violent and periodic changes in the magnetic elements at a point on the earth's surface.

Magnetic Substances. Those which are attracted by a magnet.

Molecular Theory of Magnetism. This regards each individual molecule of the magnetic substance as a complete magnet. The process of magnetization is considered as the rotation of the molecular magnets into alightment with similar poles pointing in the same direction.

Permanent Magnetism. That kind of magnetism caused by the magnetization of a glass, hard piece of steel and then suspending it in a current of steam for twenty hours. This magnet is not subject to the gradual diminution which is evident in ordinary magnets.

Permeability. A measure of the ease with which lines of force may be established in any medium as compared with a vacuum. It is the ratio of the number of lines of force present in a substance subject to a magnetizing force to the number of lines present with the substance not present in the field.

Retentivity. The capacity of retaining magnetization after the magnetizing power has been removed.

ELECTRICITY.

The part of Physics which has yielded probably the most important applications affecting our civilization. It has also uncovered to us many mysteries of the Universe. Dr. William Gilbert was the first to make much advance but since the time of Michael Faraday, the world's most brilliant experimenter, the progress in the theory and application of electricity has been remarkably rapid. The study has been generally divided into three parts; electrostatics or electricity at rest, electricity in motion, induced currents.

Electrostatics takes up the general facts of electrification, the static electrical machines, potential, capacity and atmospheric electricity. In the study of *electricity in motion* there is the theory of the Voltaic cell and the chemical, thermal and magnetic effects of electric currents. These effects are made the basis of methods for measuring currents and there are many types of electrical measuring instruments as well as electrical appliances. These effects have also given rise to the electrical appliances for the ordinary pursuits of industrial and domestic life such as electromagnets, heaters, sources of illumination and electroplating and welding apparatus and storage batteries. The *phenomenon of an induced current* was discovered by Michael Faraday and has resulted in the development of the dynamo and motor, the induction coil and transformer, wireless waves, radio, and also X-Rays. This division of the subject includes the study of the principles and properties of the general electro-magnetic radiations, that pervade throughout empty space and penetrate even through matter to a varying degree. A recent interesting and important development is the study of the electron, the ultimate unit of electricity investigated by Sir Joseph J. Thomson of England and Robert A. Millikan of America. This promises to yield some very interesting information regarding the structure of matter itself.

Electrification can be produced by, *friction, induction* and by *conduction.* The first case arises on rubbing two unlike insulators together and then separating them. They are charged with equal quantities of electricity, the one with positive, the other with negative. The second case arises when an electrified body is suspended inside a hollow conducting vessel without touching it. The outside of the vessel becomes charged similarly to that of the electrified body and the inside oppositely. The last case arises when an initially uncharged and insulated metal body is connected with an electrified body by means of a conducting wire. The uncharged body becomes electrified by conduction.

Ampere. The practical unit of current; the current which will deposit silver at the rate of 0.001118 grams per second. See definition of the International Ampere also.

Conductivity. The property of an electric conductor depending on its dimensions, material and temperature which determines the current produced by a given electro-motive force.

Conductors. Bodies which readily conduct electricity. Insulators are bodies which conduct electricity very poorly at low temperatures, namely, lower than 1200° C.

Coulomb. The unit of quantity of electricity and equals a current of 1 ampere during 1 second of time. It is 1/10 units on the centimeter-gram second system, and deposits 1.118 milligrams of silver, and is named after C. A. DeCoulomb, (1736-1806).

Daniell Battery. In 1836, Daniell invented a battery in which the metals were exposed to the action of dilute acid in a glass jar. This form is more constant and requires less frequent cleansing than a voltaic pile. The solution is of copper sulphate (copperas or blue stone), in which a rod or amalgamated zinc contained in a porous cup is surrounded by a copper coil. Modifications are the Grove, Smee, and other cell batteries.

Dielectric Constant. The ratio of the charge which a condenser holds with the given medium as dielectric to the capacity which it has when air is used as a dielectric.

Eddy or Foucault Currents. Magnetic substances are also good conductors of electricity. Therefore, when the flux varies in the magnetic substance an electro-motive force and consequently an electric current is set up. These currents are very large in alternating currents instruments unless some precaution, such as laminating the core, is taken. Some non-magnetic substances also experience Eddy currents.

Electro-chemical Equivalent, of an element is the weight in grams which is deposited by the passage of the unit quantity of electricity (1 coulomb).

Electric Current is a flow of electrons more or less unidirectional and opposite in direction to that of the generally accepted current.

Electric Oscillations. These occur when an electromotive force is momentarily impressed upon an electric circuit where the damping by Ohmic resistance is negligible, or when the electromotive force is removed. The period of the oscillations varies as the square root of the self induction and the capacity of the circuit.

Electro-magnetic Induction. This is the phenomenon where any change in the direction or intensity of a magnetic field gives rise to an induced electro-motive force in any conductor

in the field and this causes an induced current if the conductor forms a closed circuit.

Electromotive Force. That which causes or tends to cause a flow of electric current; usually designated by E. M. F.

Electrolysis. The process by which a current of electricty causes a conductor placed in a liquid to undergo chemical dissociation into charged ions which act as positive and negative carriers of electricity through the solution.

Electrolyte. A conductor which undergoes chemical dissociation on electrolysis. Dissociation is the breaking down of the molecules of a compound substance into the charged ions which compose it, one group positive, the other negative.

Electro-motive Force of Polarization. The back electromotive force produced by the accumulation of hydrogen bubbles on the metallic plate.

Electron. The ultimate unit of negative electricity. It has been shown by Sir J. J. Thompson of England and Professor R. A. Millikan of America to possess a definite quantity of electricity equal to 1.591×10^{-19} coulombs.

Electric Line of Force. This is such that its direction at every point is the same as the direction of the electric force, which would act on a small unit positive charge placed at that point. It is defined as starting from a positive charge and ending on a negative charge.

Farad. The practical unit of capacity and represents the capacity of a condenser that has a charge of 1 coulomb when charged with a difference of potential of 1 volt. It stands for 10^9 units on the centimeter-gram-second system. The microfarad is one-millionth of a farad. Named after Michael Faraday (1791-1867).

High Frequency Oscillations. These are electrical vibrations of great rapidity and high frequency, usually, several millions per second produced in circuits having *inductance* and *capacitance.*

Induced Electromotive Force. The Electromotive Force between the ends of a conductor set up when a change is made in any way in the number or direction of the magnetic lines of force in the immediate neighborhood of the conductor.

Induced Electric Current. Current flowing around a closed circuit as a result of an induced electromotive force.

Induction. Power which an electrified body has of calling forth electrical or magnetic properties from other bodies with which it is not in direct contact. It is upon this strange principle that the soft iron magnet is constructed.

Kilowatt Hour. Amount of energy necessary to perform 1,000 watts in one hour.

Mutual Induction. Phenomenon where a change of current in a conductor is accompanied by a change of its magnetic field which induces an electromotive force in a neighboring circuit.

Ohm. Practical unit of electrical resistance (R) of a column of mercury 1 square millimeter cross-sectional area and 106-3 centimeters long. It is 10^9 absolute units of resistance on the centimeter-gram-second system. The British Association ohm. is 0.987 of a true ohm. Named after Dr. G. S. Ohm. See International Ohm also.

Polarity. The possession of magnetic poles; the property acquired by a magnetizable body when brought into a magnetic field.

Polarization. Reduction of the strength of a current derived from a simple cell due to the collection of gas bubbles on the metallic plate reducing the potential difference and the effective area.

Resistance. That property of a conductor which causes the passage of a current of electricity through it to be attended by a dissipation of energy, as the change of electricity into heat, is called the resistance of the conductor. The less the resistance in proportion to the electromotive force, the stronger the current, in obedience to OHM's law, $C = \frac{E}{R}$.

Self Induction. When a current passes through a conductor a magnetic field is built up about it. The intensity of this field is proportional to the current in the conductor. Consequently any change in the current intensity will cause a corresponding change in the field about the conductor. This change in the electromagnetic field by the principle of electromagnetic induction sets up another electromotive force and current which opposes the change in the original current. The result is comparable to inertia.

Simple Voltaic Cell. A cell composed of two metallic plates such as zinc and copper, immersed in an electrolytic solution such as sulphuric acid. A difference of potential is set up between the two metals.

Storage Battery. A combination of accumulators, which when once charged gives back a continuous and regular current when the poles are connected. It consists primarily of two specially formed sheets of lead coated with red oxide of lead. The chief forms are the Planté, the improved Faure forms and the Edison types.

Superconductivity. The name given to the phenomenon observed when the electrical resistance of very pure metal decreases towards zero when the temperature is reduced to the neighborhood of absolute zero.

Volt. The practical unit of electromotive force (E) required when one ampere passes through a conductor whose resistance is one ohm. It is a little less (.936) than the electromotive force of a Daniell cell; and is 10^8 absolute units of electromotive force on the centimeter-gram-second system. Named after Volta. See International Volt also.

Volta's Series. A series of metals such that any metal in the series acquires a positive charge when touched by any other metal lower in the series and a negative charge when touched by any metal preceding it. They are: Zn, Pb, Sn, Bi, Sb, Fe, Cu, Ag and C.

Voltaic Pile. In 1800, Volta placed discs of copper and zinc in alternate formation and separated by layers of cloth saturated with an acid solution.

Watt. The practical unit of electrical power which equals the power of a current of 1 ampere when the resistance is 1 ohm. It is equal to 10^7 units on the centimeter-gram-second system and to 0.0013405 of a horse power. Named after James Watt (1736-1819).

PHYSICAL LAWS.

Mechanics.

Newton's Laws of Motion.

1. Every body continues in its state of rest or of uniform motion in a straight line except in so far as it may be compelled by an external force to change that state.

2. The acceleration is proportional to the impressed force and takes place in the direction of that force.

3. To every action there is an equal and opposite reaction.

Parallelogram Law of Forces: If two forces be represented in magnitude and direction by two sides of a parallelogram and lines be drawn at their extremities so as to complete this parallelogram, the diagonal drawn so as to intersect the angle between the forces represents the resultant force in both magnitude and direction.

Hooke's Law states that within the elastic limit of any body the ratio of the stress acting to the strain produced in the body is constant.

Archimedes' Principle. A body immersed in a fluid loses weight due to an upward buoyant force and this equals the weight of the fluid displaced.

Pascal's Law. The pressure exerted upon any area of a surface of confined liquid is transmitted undiminished in all directions to every part of the containing vessel.

Sound.

Laws of Transverse Vibrations of a Stretched String.

1. *Length.* The number of vibrations per second of a stretched string is inversely proportional to its length.

2. *Diameter.* The number of vibrations per second is inversely proportional to the diameter of the string.

3. *Density.* The number of vibrations per second is inversely proportional to the square root of the density.

4. *Tension.* The number of vibrations per second is proportional to the square root of the stretching weight.

Heat.

The Laws of Boiling.

1. The boiling point increases with the pressure.

2. The boiling point for a given liquid is constant for a given pressure but differs with different liquids.

3. The temperature of a boiling liquid remains constant until every portion has been vaporized.

Boyle's Law, states that for a given constant temperature the volume of a gas varies inversely as the pressure.

Charles' Law, states that the volume of a gas kept under constant pressure varies directly as the absolute temperature.

Light.

Law of Intensity. The intensity of illumination varies inversely as the square of the distance from the source.

Laws of Reflection.

1. The *angle of reflection* is equal to the angle of incidence.

2. The *incident ray,* the reflected ray and the normal to the surface are all in the same plane.

Laws of Refraction.

1. The sine of the angle of incidence divided by the sine of the angle of refraction is a constant quantity, called the index of refraction.

2. The *refracted ray,* the *incident ray* and the normal to the surface are all in the same plane.

Magnetism and Electricity.

Laws of Attraction and Repulsion.

1. Like magnetic poles repel while unlike poles attract.

2. Like electrical charges repel while unlike charges attract.

Faraday's Laws of Electrolysis.

1. The *quantity* of a substance deposited at an electrode by electrolysis is proportional to the current and to the time.

2. The *masses* of different elements deposited by the same current are proportional to their chemical equivalents.

Joule. The unit of electrical work and expresses the work done by electrical power of 1 watt for 1 second. Named after J. P. Joule (born 1818) of Manchester, England.

Lenz's Law. The direction of the induced current is always such that it produces a magnetic field which tends to oppose the change that causes the induced current.

Ohm's Law. The current flowing in a circuit is directly proportional to the electromotive force applied and inversely proportional to the resistance.

Physical Units of Measurement.

Calorie. The amount of heat required to raise the temperature of one gram of water one degree centigrade.

Coulomb. The amount of electricity passing a point in a circuit in one second when the strength of the current is one ampere.

Dyne. That force which acting on one gram mass will impart to it an acceleration of one centimeter per sec.

Foot-pound. The work done in raising one pound one foot.

Gram of force. The attractive force of the earth on one gram mass at its surface.

International Ampere. The unvarying electric current which, when passed through a solution of silver nitrate in water, deposits silver at the rate of 0.001118 gram per second.

International Ohm. The resistance offered to an unvarying current by a column of mercury at the temperature of melting ice, 14.4521 grams in mass, of a constant cross-sectional area, and of a length of 106.3 cm.

International Volt. The electrical pressure which, when steadily applied to a conductor whose resistance is one International Ohm, will produce a current of one International Ampere.

Horse-Power. (H. P.). The rate of doing 550 foot-pounds of work in one second.

Pound of Force. The attractive force of the earth on one pound mass at its surface.

DENSITY OR SPECIFIC GRAVITY.

The table gives the density or the weight in grams of one cubic centimeter of the substance. The number may also be regarded as specific gravity:

Air at 0° C. and 76 cms. press..	0.00129
Alcohol (ethyl) 90% 20°C.....	0.818
Aluminum	2.670
Brass (cast)	8.400
Charcoal	1.6
Coal, anthracite	1.26 to 1.80
Coal, bituminous	1.27 to 1.423
Copper (cast)	8.83
Cork	0.14 to 0.24
Diamond	3.530
Ether	0.736
Glass (plate)	2.760
Gold	19.360
Human body	0.890
Hydrogen at 0° & 76 cm. press....	0.0000896
Ice	0.917
Iron, cast	7.655
Lead, cast	11.360
Mercury at 0° C.	13.596
Milk	1.032
Paraffin	0.824 to 0.940
Sugar (cane)	1.593
Sea water	1.027
Water at 0° C.	0.999
Water at 4°	1.000

Physical Constants.

Charge on Electron, elementary electrical charge, $e = 1.591 \times 10^{-19}$ coulombs.

Electrochemical equivalent of silver, 0.001118 gm. per sec. per ampere.

Number of gas molecules per c.c. at 760 mm. and 0° C., $N = 2.70 \times 10^{19}$.

Radius of an atom = about 10^{-8} cms.

Velocity of light in a vacuum = 2.9989×10^{10} cm. per sec. = 984×10^{6} ft. per sec.

Mean wave length of yellow sodium light, 00005893 cm. or 5893 angstrom units.

Velocity of sound in dry air at 0° C. = 33,136 cm. per sec. = 1089 feet per sec.

Density of water, a maximum at 3.98° C. = 0.999973 gm. per c.c.

Density of mercury at 0° C. = 13.5955 g. per c.c.

Density of dry air at 0° C. and 760 mm. = .001293 gm. per c. c.

Coefficient of expansion of gases, .003665.

Specific heat of air, at constant pressure, 0.238.

Latent heat of fusion of water 79.24 cal. per gram.

Latent heat of vaporization of water, 535.9 cal. per gram.

Mean density of the earth, 5.52 grms. per cu. cm.

Acceleration due to gravity at sea level, lat. 45° = 980.60 cm. per sec. per sec. = 32.172 feet per sec. per sec.

Length of seconds pendulum at sea level, lat. 45° = 99.356 cm. = 39.116 in.

Mechanical Instruments.

Roman steel-yard is an old apparatus for weighing objects, using the principle of the lever. The graduated steel-yard or bar with scale pan or hanger is balanced at a point near one end by making it very massive at that end. The scale pan or hanger is fixed in position. The object to be weighed is then balanced by the small sliding weight which is moved to some division indicating the weight.

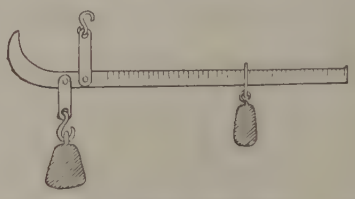

Fig. 1. Roman Steel-yard.

Jack screw, a machine based on the principle of the inclined plane. A force of a few pounds applied at the end of a long lever arm will enable one to raise hundreds of pounds. However what is gained in force is lost in distance since the applied force must move through a much greater distance in comparison.

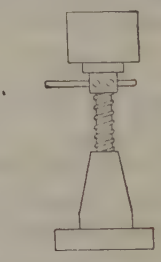

Fig. 2. Jack Screw.

Micrometer caliper, enables one to measure the thickness of small substances such as steel balls, hair or paper very accurately to one-tenthousandth of an inch. They are graduated usually in thousandths of an inch or of a centimeter.

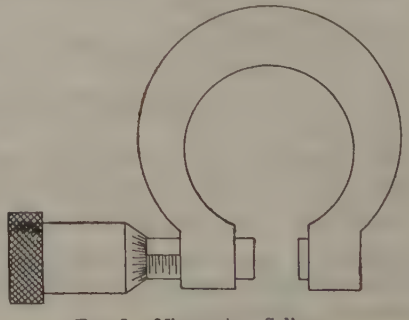

Fig. 3. Micrometer Caliper.

Vernier caliper is used to measure the inside and outside diameters of tubes and rods to about one-hundredth of an inch or better. It can be used very accurately owing to the use of an attached vernier scale.

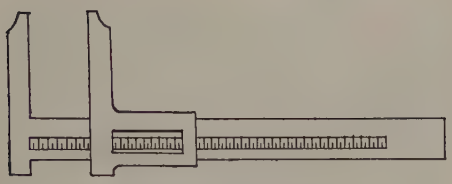

FIG. 4. Vernier Caliper.

Plumb line is a very simple but important instrument used to test the position of lines and surfaces required to be vertical. It consists of a flexible cord with a very symmetrical weight called the plumb bob suspended centrally from one end. It is much used in building and surveying.

The **airship** and the **submarine** are both illustrations of Archimedes principle. In each case there is a buoyant force due to the displacement of a large quantity of air or water and equal to it in weight. In the airships the effective amount of air displaced is regulated by small balloonets inside the large gas bag which are filled or emptied by pumps. This regulates the lifting power to a certain extent. This is similar to the method used for controlling the level of the submarine. Both use a system of horizontal and vertical vanes as well. The driving force is supplied by a series of propellers. When floating horizontally the lifting force due to the displacement is exactly equal and opposite to the total weight of the airship or submarine with all its contents.

Plumb Rule is used to determine the perpendicular direction at any point, an important matter for masons and bricklayers. It consists of a narrow truly rectangular board cut out down the center with an egg-shaped hole at the lower end for a plumb line and bob to swing in when vertical.

Fixed Pulley is a simple machine and enables one to change the direction of a force to be applied into a more convenient direction. Its value is unchanged if the friction is negligible no matter what the angle.

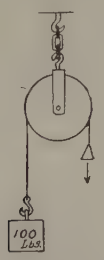

FIG. 5. Fixed Pulley

Single movable pulley gives a mechanical advantage of two so that the force exerted is only one-half the weight lifted. The other cord carries the other half of the weight. The distance through which the force is moved is double the distance the weight is raised. By combining it with a fixed pulley the applied force can also be changed in direction.

Combinations of pulleys are formed by threading a rope from pulley to pulley in a fixed block of pulleys and a movable block. In a similar combination there are two blocks each of which holds three pulleys of equal size mounted freely on the same axle. One block is secured to a rigid beam and the other attached to the weight to be moved. The rope that threads the pulleys alternately from block to block is tied at one end to the fixed block and the other end is free for applying the force. There are thus six separate strands carrying the load so that the applied force is only one-sixth in magnitude but must however move through six times the distance.

Water Pumps. There are several types such as the common farm or lift pump, the force pump for raising water to a height greater than about 26 feet and the centrifugal pump, which drives a steady stream of water by means of a number of rotating curved blades mounted on an axle. The actual depth from which well water may be pumped by the lift pump is about twenty-six to thirty feet because the atmospheric pressure is only equal to about fifteen pounds per square inch and cannot force the water up to a height greater than about 30 feet when the partial vacuum is made in the pipe and barrel. For wells of greater depth than this, it is customary to use the force pump. In this case the piston is solid and the barrel is placed nearer the lower water level with an outlet pipe and valve in its side. Each downward movement of the piston forces water out of the barrel through the valve in the side and up the outlet pipe from it. A check valve in the inlet pipe from the water prevents its return to the well. Many modern pressure pumps driven by power are based on the principle of the force pump.

Air Brake. Has been an important factor in the development of locomotive and railway transportation. In the Westinghouse air brake, compressed air under a pressure of about 75 lbs. per square inch acts on a piston in a cylinder and sets the brake shoes tightly against the wheels of the train. A spring in the cylinder pushes the piston back and releases the brake as soon as the air pressure is reduced.

The **phonograph reproducer** consists of a thin flexible diaphragm which is rigidly held all around the rim in front of a tube leading to the horn. The center is attached to one end of a bar which carries the needle at the other end. The needle is made to vibrate by allowing it to follow the wavy groove in the record and vibrations are imparted to the diaphragm similar to those which formed the groove so that spoken words, orchestral and vocal music are reproduced by it with surprising exactness.

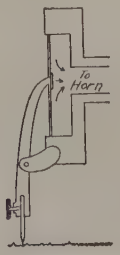

FIG. 6. Phonograph Reproducer.

The airplane is the result of man's attempt to fly through the air. After many historical attempts the "heavier than the air" type was perfected by Orville and Wilbur Wright in the United States in 1903. The "lighter than air" type has been successfully developed since 1783 when J. E. & J. M. Montgolfier of France left the ground in their balloon. The airplane is forced against the air by a powerful gas engine which drives a strong wooden propeller at high speed. It is the reaction of the air against the long propeller blades which drives the airplane against the air. The air streams past the wings which are slightly inclined with the horizontal so that the forward horizontal resisting force of the air is divided into two components one along the surface of the wings and the other perpendicular to their surface and directed upwards. The former component has little effect, while the latter acts as a lifting force which keeps the airplane from falling. A very important feature is the design of the chamber or hollowed out formation of the wings which was developed long ago mathematically by an English engineer. The proper design lessens the air resistance and increases the lifting power.

Vacuum pumps are used for exhausting the air from sealed or confined vessels and bulbs such as radio and audion tubes. On nearly all the types mercury has been used for securing the last stages of exhaustion. The water aspirator will give only a poor vacuum while the rotary oil pump has been developed with a good deal of success during recent years. The first pump was the Guericke air-pump and by using two in series with layers of oil as seals for the valves it became very successful. There is the efficient Gaede rotary mercury pump which traps portions of the air in small sections of a hollow rotating drum and delivers them to the outside, thus reducing the pressure by successive stages. This will give a final pressure of about one millionth of an atmosphere. However, the most recent and by far the most efficient is the mercury vapor diffusion pump such as the Langmuir type which uses a stream or jet of mercury vapor to drive out the molecules of air or gas from the vessel to be exhausted into another one from which a less efficient pump can remove them. The principal is that of the aspirator. Its simplicity and thoroughness in giving a vacuum of about 0.000001 cm. of mercury marks a great advance in methods of obtaining high vacua so desirable for modern research. Usually charcoal cooled with liquid air has been used to get a good vacuum. In radio tubes special films of chemicals called "getters" are used to improve the vacuum by absorbing the remaining gases in the air-exhausted tube.

Water analysis. Water is a chemical compound of two parts of hydrogen to one part of oxygen by volume or one part of hydrogen to eight parts of oxygen by weight. Natural waters are seldom pure, because springs, wells and rivers are often contaminated by drainage from nearby lands and by sewerage from human habitation. Such waters contain some organic matter and the products of its decomposition. Besides these, there may also be inorganic and harmful bacteriological impurities so that drinking water should be carefully examined for all three. A chemical analysis is not sufficient. Rain water is the purest of the ordinary waters found in nature but it contains on the average from two to three parts of dissolved solids in 100,000, in addition to the gases it has absorbed and washed down out of the atmosphere. Water that holds no mineral water in solution is *"soft"* water and when soap is added will readily form a lather. Magnesia and lime in the water make it *"hard"* and cause a curd to form when soap is added. Temporary hardness is that which is removed by boiling while permanent hardness needs the addition of chemicals to render it soft.

Rail elevation on curves is necessary to permit trains to travel around curves at even a moderate speed. The amount of elevation of the outside rail above the horizontal is calculated by railway engineers so as to provide a component of force to oppose the centrifugal action that arises when bodies move in a circular path.

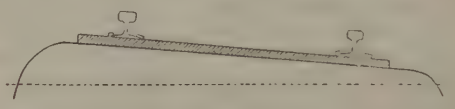

Fig. 7. Elevation of Outside Rail on Curves.

Gyroscope is a mechanical device invented about 1800. The improved types consist of a very heavy wheel with the mass concentrated in the rim, which is so mounted as to be free to rotate about three axes mutually at right angles. When the heavy wheel is made to rotate at a fairly high rate of speed, it is readily discovered that the gyroscope resists any direct attempt to change the direction of the axis of spin. It also will refuse to fall while spinning even if it is placed obliquely on one side of a single support, but slowly precesses about a vertical axis. Examples and applications of gyroscopic action are the earth itself, the *Brennan mono-rail* car, the gyroscope toys, *anti-rolling gyroscopes* on ships, *controlling gyroscopes* for torpedoes, *stabilizing gyroscopes* for bombing and photographic airplane apparatus and the *gyro-compass* for indicating the true north.

Pendulum. *The number of vibrations made by pendulums of different lengths varies inversely as the square root of their length.* If one is 4, 9, or 16 times as long as another, the square roots are 2, 3, and 4 times as great, respectively, but the number of vibrations of the longer one will be only ½, ⅓, or ¼ as many as the shorter. The time in which the vibration will be made varies directly as the square root of length, that of the longer taking 2, 3, or 4 times as long as of the shorter. A pendulum to make a single half vibration in 1 second at the latitude of New York is 39.1013 inches in length.

Barometer. An instrument for measuring the weight or pressure of the atmosphere; invented by Torricelli (1643). Consists of a glass tube more than 30 inches long sealed at one end and filled with mercury. The weight of the atmosphere balances a column of mercury equal to its own weight—30 inches of mercury in a tube one inch in cross-area weighs about 15 pounds. In a wheel barometer a float rests upon the mercury at the open end and by a thread and pulley attachment with the index hand records the

weight as the mercury rises or falls. The *aneroid barometer* consists of a vacuum box whose sides or diaphragms are connected by a system of springs, levers and chain which record the pressure of the air upon the sensitive diaphragms. The barometer acts as a weather indicator only so far as to show sudden and marked changes in the pressure of the air—a sign of atmospheric disturbance. The pressure of the air decreases as one passes from the surface of the earth, therefore when the rate of decrease is known from tables, the height of mountains or of balloon ascensions may be accurately determined. Roughly speaking, the barometer falls $\frac{1}{10}$ inch for every 90 feet of ascent above the sea level up to 1,000 feet, at one mile high it falls $\frac{1}{10}$ inch for about every 106 feet rise.

THERMAL INSTRUMENTS.

The **Davy safety lamp** used by miners was invented by Sir Humphrey Davy about 1800 A. D. It depends on the fact that wire gauze surrounding the illuminating flame of the lamp conducts heat away very rapidly in case explosive gases are present. The flame may ignite them inside, but the gases outside are not ignited.

The **hot air heating system** is one of the most common methods of heating human habitations. It is very rapid and not very expensive to instal. Each furnace is designed to heat a definite number of cubic feet of space and should be large enough in capacity to keep the house at about 70° F. during a cold blizzard on a winter night. The furnace itself consists of a cast-iron fire-box with considerable heating surface in the passages, through which the flames and smoke pass on their way to the chimney. The air to be heated

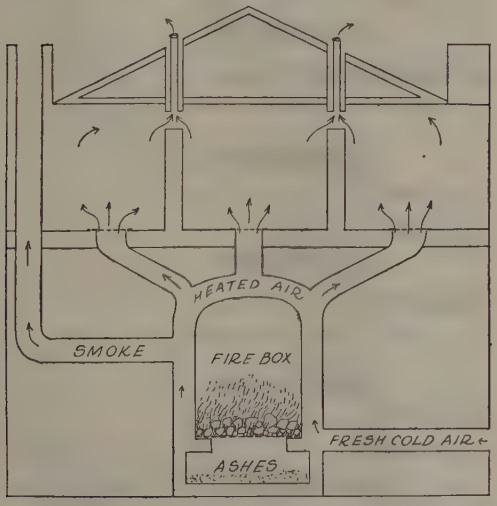

FIG. 8. Hot Air Heating System.

enters from below around the fire-box and is heated by coming in contact with the hot walls of the fire-box and passages in the drum above it. There is usually 35 times as much heating surface as there is grate area. The air is passed over a filled water tank to supply moisture to it. A furnace should not be leaky as this may be a source of real danger to the persons in the house. Large pipes lead the heated air from the furnace to the registers near the floor of each room. Heated air tends to rise of its own accord since it is lighter than cold air and so all ducts and flues should have an upward slant. Those flues going to the upper floors are built in between the lower walls. All conducting pipes should be well covered with asbestos paper which prevents the loss of heat before the air reaches the room it is intended to heat. No provision is sometimes made for the returning of the cold air to the furnace except perhaps through large return pipes from one or two large open grids placed in the floors of the lower rooms. However, in order to secure a supply of fresh air an extra inlet is sometimes provided leading from out of doors to the enclosed space around the fire-box. When the house is warm some windows can be opened at the top.

The **steam turbine** consists of a set of fixed blades or vanes, called *Guide Blades*, which direct the motion of the high pressure steam so that it impinges upon another set of vanes carried by a shaft free to rotate. The whole mechanism is enclosed. Modern turbines are generally the parallel flow type in which the motion of the steam is along the axis or shaft. In the Parsons turbine the steam is kept alternately bounding from fixed to movable blades many times before its energy is expended. The rows of fixed blades are attached to the metal casing and they serve merely as guides to redirect the steam at the most favorable angle against the next row of movable blades. In the Curtis turbine the steam is directed against the first set of movable blades through inclined nozzles of a special design. Turbines are very efficient, economical of space and attain very high speeds. They are used chiefly for driving dynamos, and for propelling large ocean liners and destroyers. The first to be invented was the ancient model by Hero of Alexandria in the second century B. C. Branca designed one in 1629 and this was followed by the work of Kempeln (1784), Watt (1784), Sadler (1791), Trevethick (1815), Ericsson (1830) and Perkins (1836) but the most practical application and development was done by the Hon. C. A. Parsons, F. R. S., in 1884, who designed one of 10 H. P. which was in actual operation for some time.

The **Ammonia refrigerating** process is based on the fact that when evaporation takes place from a liquid it is cooled and must secure heat energy from its surroundings in order to keep on vaporizing. A compressor exhausts ammonia gas from above the surface of liquid ammonia through pipes which are cooled by running water and the heat of vaporization and of compression is taken away, turning it into a liquid again. This is returned to the evaporating chamber where it again cools the circulating brine for the refrigerating system as it evaporates into the partial vacuum above its surface and goes to the compressor. The first work of this kind dates from the experiments of Michael Faraday in 1823 on the liquifaction of gases.

Fractional distillation is the process of collecting evaporated portions in fractions as the boiling point of a mixture rises. By repeating the

operation with the fractions, fairly pure portions of each constituent can be secured. This separation depends on the principle that different liquids have different boiling points and can be collected in regular order as they are vaporized. These fractions are then redistilled. In the important refining of oil, crude petroleum from the oil wells is heated in a still and first the dissolved gaseous hydrocarbons are driven off, then the lighter oils, naphtha, gasoline and benzine, later on follow the denser kerosenes or burning oils, then the fuel oils and the waxes.

The **thermos bottle** is a very practical application of all the principles of transmission of heat. It consists of a double walled glass bottle with the air exhausted from the space between the walls which are also smooth and silvered on the inside of this vacuous space. Since convection currents cannot be set up in the vacuum, passage of heat is prevented across between the walls. Conduction of heat from the inside to the outside or the reverse is reduced to a minimum by having very few contacts and only the narrow neck as the main support of the inner container. The silvering reduces gain or loss of heat by transmission in the form of thermal radiation, because bright and smooth reflectors are poor absorbers and poor radiators. Hence a cold substance in the bottle tends to remain cold and a hot substance hot. Professor Dewar of England invented the thermos bottle for conserving liquid air. The British government during the war devised metal containers in place of glass for airplane and military use.

A **thermostat** is an instrument which makes use of the unequal expansion of two flat metal strips such as iron and brass riveted together to control the temperature. One end of the bimetal strip is firmly clamped while the other end makes or breaks an electrical circuit when any change in the temperature causes the strip to become curved. The electrical circuit controls a clockwork motor which operates the drafts of the furnace. The thermostat in this way keeps the rooms at a uniform temperature. Thermostats have been found very useful in modern chemical research.

Thermometer. An instrument for measuring temperature depending upon the almost universal principle of the expansion of bodies under heat. *Mercury thermometers* are used to measure above —39° F. and below 660 degrees F. *Alcohol thermometers* measure below —39 degrees F. The *Fahrenheit thermometer* marks the freezing point at 32 degrees and the boiling point at 212 degrees. The zero of his system was the lowest temperature mark recorded by him in the winter of 1709. The *Reaumur* scale calls the freezing point zero and the boiling point 80 degrees; so that 80 degrees Reaumur = 180 degrees F. The *air or gas thermometer* registers by the change of volume or pressure of a quantity of dry air or gas contained in a reservoir. The *metallic thermometer* registers by the expansion or contraction of a bar of platinum, silver or gold.

A **clinical thermometer** is a sensitive temperature recording instrument of short range used for medical purposes to determine the temperature of the human body. A constriction holds the mercury up at the highest point reached after expansion and a sudden jerk is needed to send it down ready for a new reading. The proper normal temperature for the blood is 98.6° Fahrenheit.

Gasoline engine derives its energy from the heat evolved in the chemical combustion of a mixture of gasoline vapor, and air. The diagram represents a single acting engine where there is only one explosion for two revolutions of the flywheel or four to and fro strokes of the piston. The first (an outward) stroke allows the air and gasoline vapor to be drawn in. The second (a return) stroke compresses and so heats it up. The explosive mixture is now ignited by a spark and drives the piston out on its third (an outward) stroke. The fourth (a return) stroke cleans the cylinder by driving out the spent gases ready for another series of four strokes. The flywheel stores up the energy supplied during the third stroke.

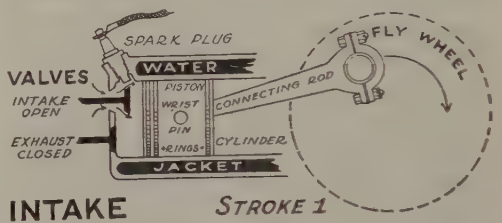

Fig. 9. Suction Stroke.

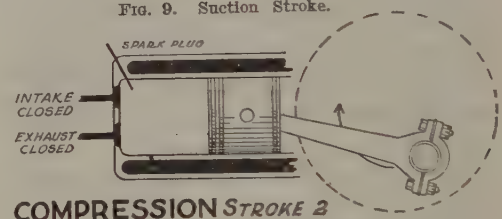

Fig. 10. Compression Stroke.

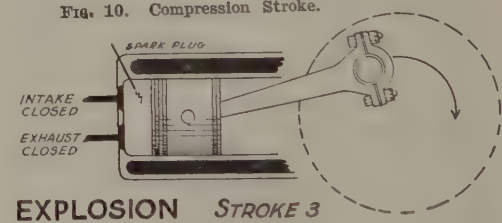

Fig. 11. Expansion Stroke

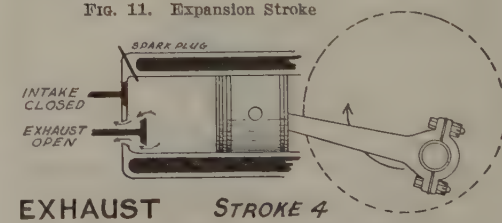

Fig. 12. Exhaust Stroke.

The **steam engine** was developed to the greatest extent by James Watt (1736–1819). The diagram shows the slide valve type. Steam enters by the inlet pipe and is admitted by the slide valve to one side only of the piston which it drives forward up to the other end of the

cylinder. At this point, cams and gears connected with the flywheel cause the slide valve to move over and open the opposite side to the live steam which makes the piston head return. At the same time the slide valve leaves the exhaust open for the spent steam to escape easily away up the smoke stack.

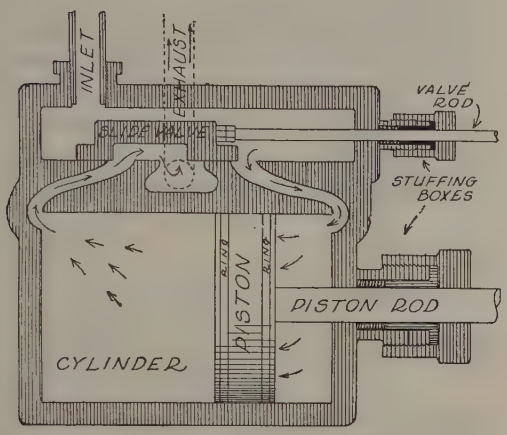

FIG. 13. Steam Engine.

The **Locomotive.** The principle of the modern locomotive is based mainly on the Laws of Transformation of Energy. When the coal is burned in the fire-box and the flames from the fiery furnace change the state of the water in the boiler to steam, we have an example of the conversion of the chemical energy of the coal into the form of thermal or heat energy of the steam. The greater the quantity of coal burned and the hotter the furnace, the greater the pressure of the steam and the higher its temperature. This high pressure steam is led through pipes and valves to the steam cylinders where it is allowed to expand and push back the pistons in them. Thus the thermal energy of the steam is converted into mechanical energy of the pistons. By means of the crosshead and the crankpin the mechanical kinetic energy of translation of the pistons is changed to mechanical kinetic energy of rotation of the driving wheels which causes the locomotive to move and haul its load of passengers and freight. This illustrates the transformation of energy from one form into another. Also the fact that there is a definite limiting relation existing between the amounts in these various forms, so that the total quantity of energy involved is always a constant one.

The **fireless cooker** is a tightly closed metal container surrounded on all sides by material that conducts heat very poorly. After the food has been heated thoroughly to the boiling point it is then closed up inside the fireless cooker. Since the loss of heat by conduction is very small, the food keeps on cooking slowly. In some types, heated soapstone discs placed with the food in the container are used to cook the food.

Optical Instruments.

Lenses are classified as follows:

A. Converging Lenses	1.	Plano-convex,—one surface plane, the other convex.
	2.	Double-convex,—both faces convex.
	3.	Concave-convex,—one face concave, the other convex.
B. Diverging Lenses	1.	Plano-concave,—one face plane, the other concave.
	2.	Double-concave,—both faces concave.
	3.	Convex-concave,—one face convex, the other concave.

Spherical mirrors are either convex or concave.

An **achromatic lens** is built up of a convergent lens of crown glass and a divergent lens of flint to produce a convergent achromatic lens; or by reversing the combination we get a divergent achromatic lens. These lenses give a sharply defined image instead of one whose edges are tinged with color and therefore indistinct. J. Dolland of London solved this difficult problem in 1758. They are a necessity in good microscopes and telescopes.

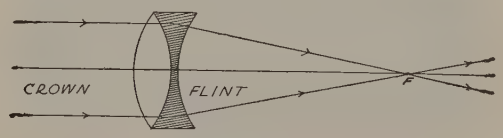

FIG. 14. Achromatic Lens Combination.

Rainbow. The beautiful spectrum found in nature due to the refraction and reflection of light in the water drops at the edge of a rain cloud. The sun which is the true source is located behind the observers.

Photometer. An instrument used for comparing the intensity of illumination given out by various sources. There are many types.

Spectroscope. An instrument used for the analysis of complex radiations. A beam of light is dispersed by means of refraction through a prism or by means of a ruled diffraction grating. The apparatus consists essentially of a *slit*, a *convergent lens*, a *prism or grating*, and a *telescope or camera*. By the study of the spectrum so formed the chemical nature of substances burned or vaporized in the flame emitting the light may be studied. By the aid of the spectroscope it has been learned that 36 of the known chemical elements are contained in the sun's atmosphere. Many new elements have been discovered by spectrum analysis.

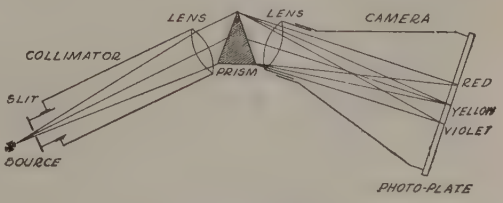

FIG. 15. Spectroscope.

Simple Microscope. A convergent lens of short focal length used so that the object is situated near the focal point on the side towards the lens.

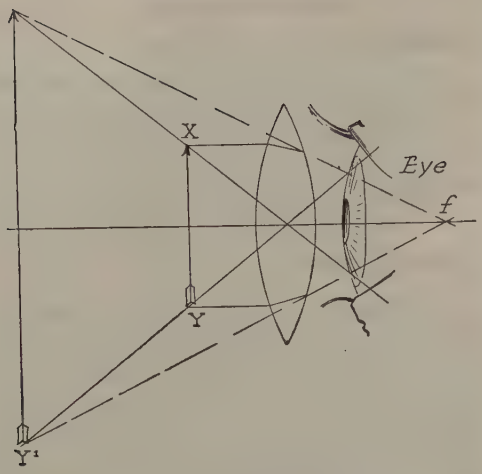

Fig. 16. Simple Microscope.

Compound Microscope. Is used to get greater magnifying power than obtainable with a simple lens. The objective lens or system of lenses held near the object forms an enlarged real image which is further enlarged to a virtual image observed through the eye-piece lens.

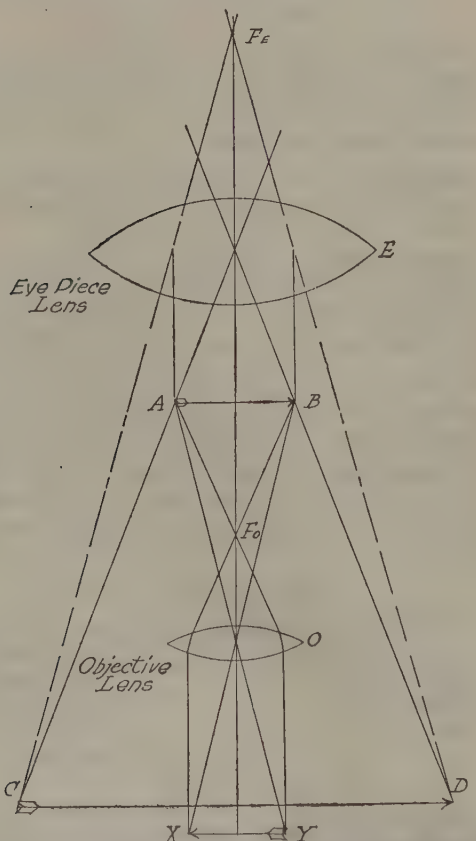

Fig. 17. Compound Microscope.

The eye is a closed chamber into which light can enter only by a lens. The crystalline lens throws a picture on the sensitive nerve endings covering the *retina*. The amount of light is regulated by a curtain called the *iris* which opens wide in the dark to collect the maximum of light rays and contracts in the presence of a bright illumination. By means of muscles the lens may be contracted or relaxed to change its curvature so that either far or near objects are formed with equal clearness on the retina. This power to focus images of the outside world on the retina is called accommodation. The eye is very similar to a camera in principle. The blind spot is the region of the retina where the optic nerve enters the interior of the eye ball. Since there are no microscopic rods and cones in this depression it is insensitive to light.

Fig. 18. The Human Eye.

Defects of Vision. Normal eyes focus the image of ordinary objects nearly on the retina, far-sighted eyes towards a point behind the retina, near-sighted eyes in front. Diverging lenses correct nearsightedness and convergent lenses farsightedness. The proper distance for reading matter is about 10 inches from the eye.

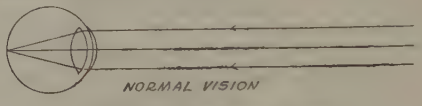

Fig. 20. The Normal Eye.

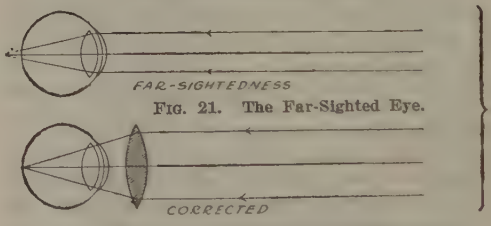

Fig. 21. The Far-Sighted Eye.

Fig. 22. The Corrected Far-Sighted Eye.

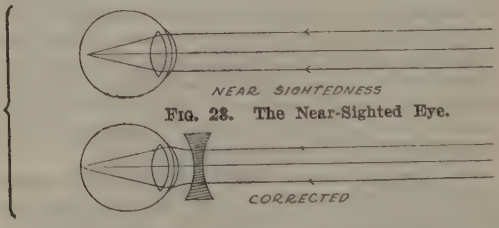

Fig. 23. The Near-Sighted Eye.

Fig. 24. The Corrected Near-Sighted Eye.

Solar Eclipse. Is caused by the moon coming into line between the sun and the earth. Behind the moon there is a deep shadow called an *umbra* extending into space for a distance, while all around and much further off into space is a less intense shadow called the *pen-*

umbra. When the earth in its orbital motion sweeps into the penumbra, there is seen a partial solar eclipse, while persons in those parts of the earth lying in the umbra see a total solar eclipse since no direct rays from the sun come into this region of the moon's shadow. Owing to the earth's rotation, different parts of the earth's surface travel rapidly through the region of total darkness. Hence the reason for the brief duration of these interesting solar eclipses, which enable the astronomers to learn so much of our solar system.

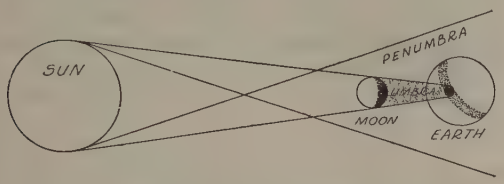

FIG. 19. A Solar Eclipse.

Camera. A device which enables one to secure a permanent impression by photo-chemical action of the bright image formed by a convergent lens placed at a small circular opening in a darkened box. Since single lenses produce some distortion, improved types used two lenses with a small perforated diaphragm placed at the optical center of the combination.

Color.

White light is a mixture of all the colors that form the continuous spectrum from violet to red. Isaac Newton was the first to analyze light and prove that it is a mixture. He classified the colors as seven; *violet, indigo, blue, green, yellow, orange, red.*

Complementary colors are two colors which produce white when superposed e.g. red, and bluish green, orange and greenish blue, yellow and blue, violet and greenish yellow, green and crimson.

Pigment colors when mixed give a quite different effect from a corresponding mixture of spectral colors. Blue paint absorbs nearly all incident light except blue, and some green; yellow paint absorbs all except some green and yellow. On mixing, green is the only color left unabsorbed. Hence it appears to be a green paint.

The **color of light** is determined by the wavelength of the electromagnetic disturbance which gives rise to the sensation of color. The wave length increases from .0004 mm. for violet to .0007 mm. for red, while the frequency of vibration decreases.

Fraunhofer lines are breaks in the otherwise continuous solar spectrum observed as fine black lines parallel to the slit. These lines are due to the absorption of different colors or light of definite wave length by heated vapors in the gaseous solar atmosphere.

The **Solar Spectrum** has a known range of 3000 to 53000 Angstrom units. There are thousands of Fraunhofer lines found in the solar spectrum and many of these coincide with the emission lines of known elements showing that these are present in the sun.

Three color printing is based on the fact that all colors can be reproduced by suitably mixing *violet, red and green.* The *complementary pigments* of these are *peacock blue, crimson,* and *light yellow* called *primary pigments.* Three different photographs are made of an object taken through a color filter of one of the spectral colors which cuts out all colors except that one. The half tone block developed from each of these is used with ink of the corresponding complementary color. Impressions from these are superposed on white paper and result in a fair representation of the natural color.

Refraction or bending of light takes place when light passes obliquely across a boundary between two different media. This is illustrated by the very old experiment of the coin at the bottom of a basin. If the eye is so placed below the rim of the empty vessel so as to be just unable to see the coin, it is possible to see the coin again in full view, without moving the eye upward, by simply filling the basin with water. *This illustrates refraction.*

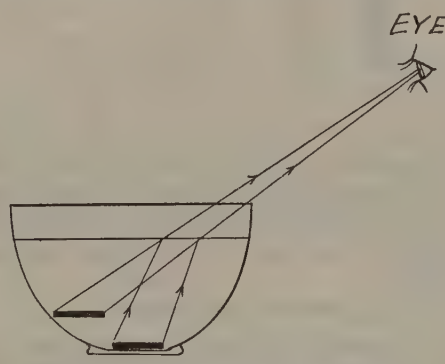

FIG. 25. Refraction of Light Experiment.

The properties of lenses and spherical mirrors:

A *converging lens* is thicker in the central portion than at the edges.

A *diverging lens* is thinner at the central portion than at the edges.

The image formation with these is governed by the following principles.

1. *Concave lenses* and convex mirrors have the same optical properties. They always give reduced and virtual images.

2. *Convex lenses* and concave mirrors have the same optical properties. They always give a real image if the object is further away than the principal focus. The size is reduced if the object is more than twice the distance to the principal focus and it is enlarged if the object is less than twice and more than once this distance. If the object is between the principal focus and the lens or mirror the image is virtual and enlarged.

Full data about an image is specified by stating.

1. *Position.*
2. *Real or virtual.*
3. *Enlarged or diminished.*
4. *Erect or inverted.*

Wireless Waves are electromagnetic waves of radiant energy of a wave length greater than one centimeter up to miles in length.

Thermal Radiation. Infra-red or heat waves are due to waves whose length lies between about eight-tenthousandth of a millimeter and one centimeter.

Visible light consists of radiation whose wave length lies between about four-tenthousandths to eight-tenthousandths of a millimeter.

Soft X-Rays consists of radiation whose wave length lies between one-tenthousandths and one-millionth of a millimeter.

Hard X-Rays from a Coolidge X-Ray tube consists of radiation whose wave length lies between one-millionth and one-tenbillionth of a millimeter.

Gamma Rays come from Radium and other radio-active substances and consists of radiation whose wave length is about one-tenbillionth of a millimeter.

Projection Lantern. An apparatus for securing an enlarged illuminated image of an object or lantern slide on a screen. It consists of a very intense source of illumination such as the carbon arc or incandescent filament, a condensing system of lenses to render the light convergent again, a holder for the slide, or transparent object and an objective system of lenses for projecting on the screen a real inverted and enlarged image of the illuminated object.

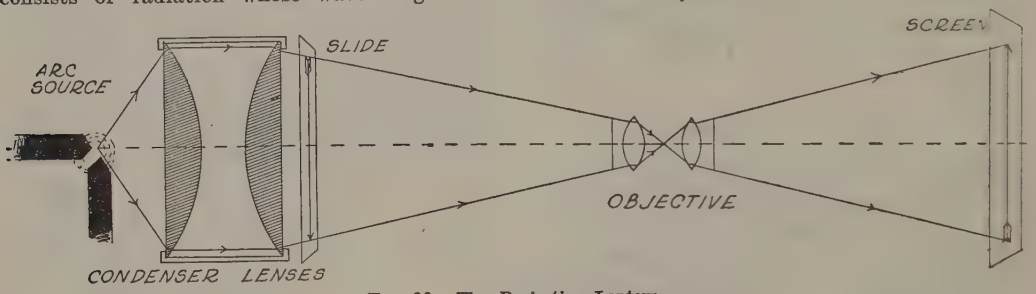

Fig. 26. The Projection Lantern.

Heliograph. An optical signaling device that has been extensively used in military operations. It reflects flashes of sunlight across considerable distances and by regulating their duration and that of the intervals secret signals are exchanged.

Electrical Instruments.

Electromagnet. A powerful magnet made by surrounding soft iron cores with magnetizing coils. It is used in preparing steel magnets, in supporting heavy weights, and in telegraph and signaling appliances.

Helix. A spiral line or a coil of wire used in the form of a solenoid.

Solenoid. An electromagnetic helix used to measure permeabilities of certain metals and to produce a strong and uniform magnetic field.

Toroid (anchoring). A continuous iron or other metallic ring wrapped with two separate sets of layers of turns of wire so that the magnetic properties of the metal may be investigated by using one set of turns as a primary circuit and the other as a secondary.

Magnetic shields are hollow iron spheres or cylinders used to reduce the stray magnetic fields around a suspended-needle galvanometer.

Electric Railways are usually run on 550 volts direct current which is supplied either by a trolley wire, a third rail wire or by a charged conductor, partly enclosed in a conduit between the rails. The rails themselves form the return part of the circuit back to the negative terminal of the generator at the power house. This is usually grounded for safety. In the electric car, the trolley leads the current down to a large variable resistance called the controller which controls the current passing through the motor driving the axles of the wheels.

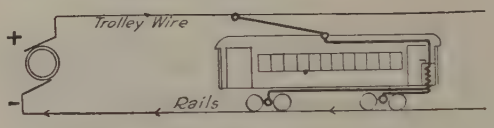

Fig. 27. The Electric Trolley.

Electric Bell. Consists of two small electromagnets which are actuated when the circuit is closed by pressing the door bell button. The iron bar is attracted to the iron cores of the electromagnets and so causes the hammer which is attached to strike the bell. This movement of the iron bar however, breaks the circuit at S—where there is a screw projecting against a spring attached to the bar. Since no current flows now the bar is released and forced back by the supporting spring against the projecting screw. This allows current to flow again which again actuates the electromagnet and rings the bell. This is repeated automatically as long as the bell button is pressed.

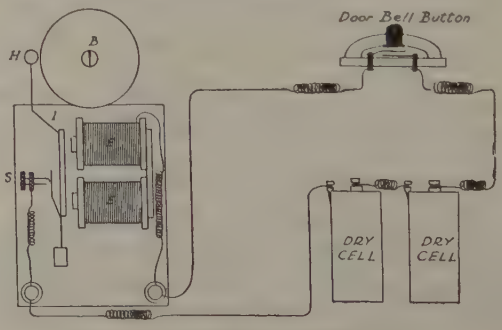

Fig. 28. The Electric Door Bell System.

Magneto. An electrical machine used to generate an alternating current for ringing telephone bells and for the ignition system in gas engines. It really consists of a small dynamo driven by gears from the engine. The potential is generally increased by means of a spark coil. This with a condenser gives hot intense sparks that ignite the explosive mixture in the cylinders.

Terrestrial Magnetism. Dr. Gilbert, physician to Queen Elizabeth, was the first to propose the theory that the earth was a large magnet. Later observation showed two well marked magnetic poles where the dip needle points vertically downwards, one on the northwest shores of Hudson's Bay and the other south of Australia in the Antarctic. The earth's magnetic field is measured by determining the declination, the intensity of the horizontal component of the total magnetic intensity and also the angle of dip or inclination. The compass needle shows the declination or angle between the geographical meridian and the magnetic meridian. The dip needle gives the angle of inclination. The former theory of the earth's magnetism is being questioned now but a complete modern theory has not yet been accepted. The non-magnetic ship, the Carnegie sails the oceans of the world determining and checking the values of the earth's magnetic quantities in all lands and seas. In this way the Carnegie Institute at Washington is now supplementing through its Department of Terrestrial Magnetism the former excellent work of the British Royal Observatory at Greenwich, England.

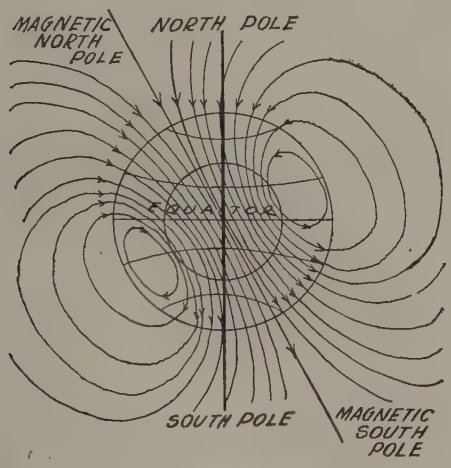

FIG. 29. The Earth's Magnetic Field.

Compass. The instrument used to indicate the magnetic meridian consists of the magnetic needle, the card, and the bowl. The circular card is divided into 32 equal parts by lines drawn from the center to the circumference to form the points of the compass which make angles of 11 degrees 15 minutes between two adjacent points. The enumeration of these points in order is called "boxing the compass." They are: north, north by east, north-northeast, northeast by north, northeast, northeast by east, east-northeast, east by north, east, east by south, east-southeast, southeast by east, southeast, southeast by south, south-southeast, south by east, south, south by west, south-southwest, southwest by south, southwest, southwest by west, west-southwest, west by south, west, west by north, west-northwest, northwest by west, northwest, northwest by north, north-northwest, north by west.

Magnetic Variations. At some places, by means of special self-recording instruments, continuous records are kept of the values of the magnetic elements. In such case it is found that the magnetic elements undergo small daily changes in value, the magnitude of the daily change depending on the location and season of the year. In addition to the *diurnal* range of change the magnetic elements undergo a periodic change of which the period is a year; this is called the *annual* range. Slow changes of which the period, if indeed these changes are at all periodic, must be many centuries, also take place in the value of the elements and these are called *secular* changes. All these changes are due to a combination of causes, the shifting of the earth's field, the minute variations of the dielectric constant of the air and possibly the position of the earth with respect to the other bodies of the solar system.

Magnetic Storms. In addition to these more or less regular changes in the magnetic elements, sudden disturbances often occur which are of considerable magnitude. The cause of such magnetic storms, as they are called, is not clearly known, although there seems to be a definite connection between them and the condition of the sun, for whenever sun spots are pronounced, magnetic disturbances are also unusually large. This is also the case during marked displays of the Aurora Borealis.

Galvanometer. An instrument for detecting the presence, ascertaining the direction, and measuring the strength of an electric current. It depends upon the fact that an electrified wire causes a magnetic needle to stand at right angles to direction of the current.

The **Movable Coil Galvanometer** consists of a coil of many turns suspended freely in the magnetic field of a permanent horseshoe magnet. When the current to be measured passes through the coil, it acts like a magnet and is turned through a definite angle depending on the strength of the current. This angle is determined by observing through a telescope, the motion of an attached pointer or the image in an attached mirror of a fixed scale.

The **Ballistic Galvanometer** is a type of instrument used to measure the quantity of electricity which passes when a current of extremely brief duration traverses the coil of the instrument. It consists of a permanent magnet, a coil of wire and a mirror. The coil is suspended by delicate threads between the poles of the magnet in such a manner that when excited by a current its magnetic poles will react upon the poles of the permanent magnet and cause the coil to swing. The mirror is fastened to the moving coil. The moving element of a ballistic galvanometer is designed for a high moment of inertia in order to lengthen the period, so that it will not move appreciably from its original position before all the current has passed into its coils.

Transformer. A device used for lowering or raising voltage in alternating current circuits. It

consists of an iron core and two separate coils of insulated wire, a primary and a secondary. When an alternating electromotive force is fed into one of these coils, the primary, the core is magnetized. The magnetic flux through it varies just as does the applied electromotive force and produces another, an induced electromotive force in the secondary coil of similar frequency and of a potential directly proportional to the ratio of the turns of wire in the two coils.

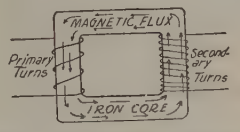

FIG. 30. Principle of Transformer.

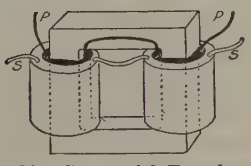

FIG. 31. Commercial Transformer.

Shunts are conductors placed in parallel with a galvanometer or ammeter to carry part of the current thereby varying the sensitiveness of the galvanometer and also preventing too heavy a current being sent through its coils.

Resistance Thermometers are those in which the fact, that an increase in the resistance of a coil of wire is produced by an increase in temperature, is used for the accurate measurement of temperature.

A **potentiometer** is a device used to compare electromotive forces, to measure any sized currents, to measure a high electromotive force, to measure the internal resistance of cells and to calibrate ammeters. It is composed of a long wire of uniform cross-section, joined in series with a battery of constant electromotive force and an adjustable resistance. It requires the use of a sensitive galvanometer. By means of a standard cell, the current through the wire is adjusted to a fixed and definite value. The potential along the wire varies with the length and is balanced against the unknown one to be measured.

Wheatstone's Bridge is a method of measuring resistance based upon the fall of potential along two conductors connected in parallel. The unknown is in series with a known resistance R on one side and two known resistances in series form the other side R_2 and R_3. When the galvanometer shows no current in the position indicated the unknown resistance is determined by the formula $X = \frac{R_2}{R_1} R_3$ (ohms).

The principle of the telephone is based on the phenomenon of induced currents. One of the most typical is an early type which used two similar pieces of apparatus, one at each end. This consisted of a thin flexible soft iron diaphragm which was made to vibrate by the voice in front of the pole of an electromagnet whose surrounding coil was connected electrically to

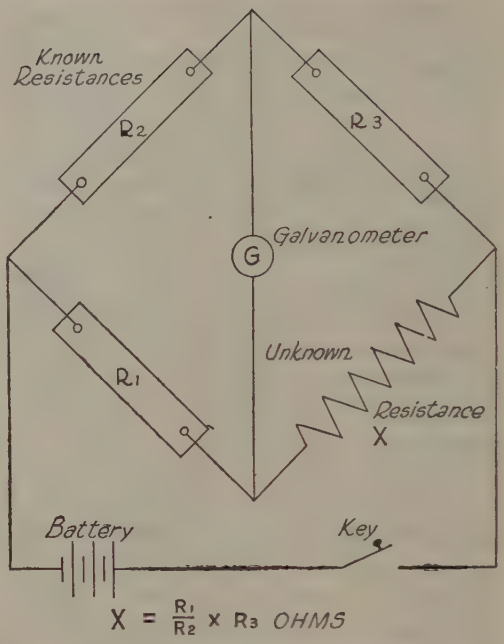

FIG. 32. Wheatstone's Bridge.

the coil of the other more distant apparatus. Motion of the thin disc changed the magnetic field of the electromagnet and gave rise to an induced current which passing through the other electromagnet caused its flexible diaphragm to imitate the movements of the first and so give rise to similar audible sounds. In the modern telephone this apparatus is still used to reproduce sounds at the far end and is called the receiver, but the carbon transmitter based on the principle of the microphone has been found more efficient as a means of impressing the desired fluctuations in the telephonic current at the speaker's end of the telephone line. The modern telephone line has many very ingenious improvements and attachments. For long distance communication, special relays and devices are necessary because the magnitude of the desired fluctuations falls off with the distance.

FIG. 33. Principle of Telephone—Early Type.

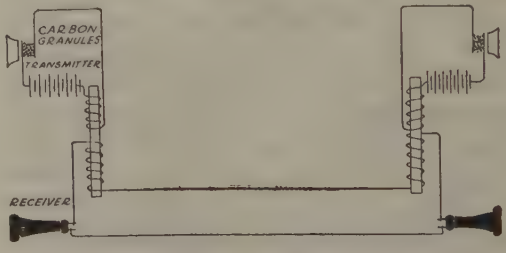

FIG. 34. Modern Telephone Circuit.

The **electric flat-iron** makes use of the heating effect of an electric current when it flows through a high resistance. This resistance wire is nichrome, an alloy of nickel and chromium which does not deteriorate so rapidly when heated like iron wire does. The current for a flat-iron used on a 110-volt circuit is from five to six amperes, meaning that the power to operate it is about half a kilowatt. If the rate is ten cents per kilowatt hour, this means that it costs about five cents to use the flat-iron for one hour. The nichrome wire is wound around and around a horseshoe shaped piece of mica, lying under the steel cover close to the smoothly polished heating plate and is carefully insulated to avoid the danger of short circuiting.

The **bread toaster**, the **coffee percolator**, the **electric oven**, and the **electric heater** are all familiar practical applications, like the electric flat-iron, of the heating effect of an electric current when it is made to flow through a resistance. In most of the above appliances coils of nichrome wire which offers a rather high resistance and withstands oxidation are suitably arranged in spiral form, embedded in a good thermal and electrical insulator. This tends to conserve and concentrate the heat energy.

Electric furnaces are of either the resistance type or the arc type. The electric resistance furnace is formed of coils of platinum, tungsten, nichrome or molybdenum wire wound around spirally on some very refractory material. The resistance offered to the passage of an electric current, through the coil results in the generation of a great amount of heat, which is prevented from escaping readily by means of good heat insulating material packed around the outside of the heating coil. The electric arc furnace depends on the heat generated by a carbon arc. A temperature of 3500° C. can be secured as against about 1800° C. with the resistance type. The arc is produced inside the crucible which holds the substances to be melted and is enclosed with good heat insulating material.

The **electric light bulb** depends on the resistance of a conductor to the passage of an electric current. The heat developed raises the fine filament or wire to incandescence. By enclosing it in a vacuum and by keeping the wire from becoming hot enough to evaporate or volatilize, which is done by using a sufficient length as a resistance to cut down the current, it is possible to keep them good for many hours use. Jobart in 1858 proposed to use a small carbon in a vacuum, but Thomas Edison of the United States, in 1879, and Joseph W. Swan of England, in 1860, made the greatest advances in this problem of electric lighting. The first filaments were made of platinum wire and later of thin carbon wire prepared from parchmentised cellulose. They are now formed of thin tungsten or tantalum wire. The electric current is brought to the lamp from the dynamo at the power plant by means of heavy copper wires carefully insulated which offer little resistance to the passage of the current. This current is led into the bulb by a special relatively thick sealing-in wire through the glass walls. This is connected to a long length of very fine tungsten wire which offers such a high resistance to the current that considerable heat is developed and the filament is made white hot. The current leaves by means of another special sealing-in wire through the glass.

Electric Arc Light. Davy in 1809 obtained light from two pieces of carbon using an electric current from a voltaic battery. Foucault, Duboscq, Deleuil, and others produced electric lights in 1853. Electric light was first used in a light house at South Foreland in 1858. The Jablochkoff candle was invented in 1877. It consisted of two parallel carbons separated by a layer of kaolin and bound together by an asbestos wrapping. Now the pieces of carbon are placed vertically one above the other as in the Weston arc lamp and fed by an automatic mechanism operated by electro-magnets which raise or lower the carbon by an electric current. The names of Brush, Weston, Thomson and Houston are intimately identified with the improvements of the arc light. Henry Lepante's great light exhibited at Chicago in 1893 attracted much attention by its great size. Its 90,000,000 candle power light is visible 146.9 miles.

Incandescent Lamp. The earliest form was devised by William Robert Grove (1840), the inventor of the Grove Battery. It was followed by that of August Kind (1845) and known as the Starr-King lamp. It has a platinum burner and a carbon in a vacuum. Probably the first house to be lighted by electricity was that of Moses G. Farmer of Salem, Mass. In 1859, he arranged a series of lamps by the subdivision of the electric current. The Sawyer-Mann lamp was produced in 1878 and consisted of an incandescent rod of carbon in a globe filled with nitrogen. Edison's lamps appeared in 1880, and introduced the use of the threadlike filament of bamboo sealed in vacuum to prevent its burning away. Its production entailed not only much litigation with Sawyer and Mann, but caused a panic in the London Stock Exchange in 1878 through fear of its causing the displacing of gas.

An **electric spark** is miniature lightning. It is the visible and generally audible phenomenon which accompanies a sudden discharge of electricity across an air gap. It is only recently that any satisfactory explanation has been found. This, in brief, considers the discharge as a rush of electrons to and fro many times across the gap, going with such a high velocity that they ionize the molecules of oxygen and nitrogen of the air against which they collide. Electrons are ejected from these molecules in all directions about the spark gap and on their return to their proper places in the atoms of the gas give forth radiant energy which makes the visible spark. Rotating mirrors and revolving systems of lenses have been used by experimenters to demonstrate the oscillatory nature of the electric discharge.

Electric Machines. Powerful currents are produced by the magneto-electric machine or by the dynamo-electric machine. In the former a permanent magnet is used; in the dynamo-electric machine, an electro-magnet is employed. Both depend upon the induction which takes place between coils of wire and magnets when their respective positions are changed. The strength of a magneto-electric machine is limited to the strength of the inducing field magnets. The use

of electro-magnets was discovered by Soren Hjorth of Copenhagen, who patented his machine in 1855. In it by the mutual action between the electro-magnets and the armatures an acceleration is acquired by means of which the production of electricity is greatly increased, and the power of the machine is greatly intensified. Wilde, (1866) used a small machine equipped with permanent magnets to excite field magnets wound in coils in a larger machine. Siemens (1867) dispensed with the permanent magnets used by Hjorth and took advantage of the residual magnetism stored up in the iron and used what has since been known as the bobbin armature. His discovery was shared by Varley, Wheatstone, and Farmer independently. The continuously wound ring armature was devised by Gramme and D'Ivernois (1871). The modern dynamo stands as the perfected work of such electricians as Weston, Brush, Edison, Thomson, Houston, Westinghouse and others. The armature is the name given to the coils of wire which are made to revolve. The electro-magnets are fixed in position and are known as the field magnets. These are placed on opposite sides of the armature; if two in number the machine is *bi-polar;* if several field magnets are used, the machine is *multi-polar.* Alternating currents dynamos cause the current to flow continuously in one direction. The transformer changes the character or potential of currents.

Electrocution. By a law passed by the legislature of New York (1888) to go into effect in 1889, death by a powerful electric current was substituted for hanging. One wire is strapped to the prisoner's forehead, and the other is applied to his ankle. In this way the current from a dynamo passes through the victim's body.

Sounder. A telegraphic receiver in which audible sounds are produced by the iron armature of an electromagnet. When the signaling current is made and broken at a distant station this armature is made to move to and fro between its stops. The Morse code is represented by the two distinct sounds, which it makes one as the dot and the other as the dash.

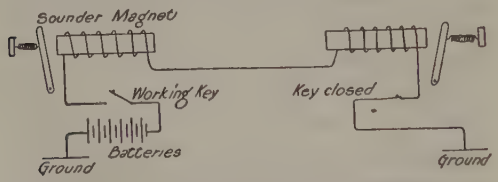

FIG. 35. Telegraphic Circuit with Sounders.

Relay. An electrical device using an electromagnet excited by the original feeble current to actuate a switch or contact maker which controls a more powerful current. This is supplied by a battery strong enough to operate easily the desired apparatus, such as the local telegraphic receiving instruments.

Microphone. A very sensitive electrical instrument for detecting weak sounds such as the ticking of a watch. The original form consisted of a pointed carbon rod resting in loose contact on two other carbon rods. When a battery is connected in series with these rods, and a pair of phones, any very small vibration of the loose rod will cause a variation in the resistance at the point of contact so that the current will vary in a manner corresponding to the sound. The microphone has been applied and much improved in connection with the transmitter of the modern telephone.

Telephone or Carbon Transmitter. Consists of a flexible diaphragm to the back of which is attached a carbon button which presses lightly against a quantity of carbon granules held in a small cavity or chamber. Electrical connections permit a weak current to pass from the diaphragm through the carbon button and granules and out along the telephone lines to the receiver and back. Any small disturbances of the diaphragm produced by the voice cause fluctuations and variations in the electric current which produces a corresponding sound at the receiver. The principle is the same as that of the microphone.

Telephone Receiver. Consists of a small horseshoe electromagnet, with two coils having a great number of turns of insulated fine copper wire on each pole. A thin flexible soft iron diaphragm is held in position quite close to the pole faces of the small electromagnet so that its central portion lies in the electromagnetic field of the latter. Fluctuations in the telephonic current flowing through the horseshoe electromagnet cause corresponding motions of the iron diaphragm which give rise to audible sounds similar to these which gave rise to the fluctuations in the telephonic current originally.

Slide-wire Bridge. A special arrangement of Wheatstone's Bridge, in which two of the three known resistances are replaced or sometimes supplemented by a long uniform wire with a sliding electrical contact.

Electric Arc. Formed when an electric current passes through the vapor between the carbon terminals of a battery connected so that there is a P. D. of at least 30 volts. Sir Humphrey Davy was the first to make an electric arc about 1800 A. D. He used the current from a large number of Voltaic cells.

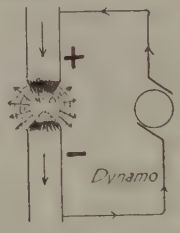

FIG. 36. The Carbon Arc Light.

Voltameters are instruments in which the strength of a current is determined by the weighing of the quantity of a metallic element liberated by the current in a given time. The standard one is the silver voltameter.

Cells:

1. The *Voltaic Cell* consists of plates of zinc and copper immersed in dilute sulfuric acid.

2. The *Daniell Cell*, consists of a zinc rod surrounded by dilute sulfuric acid contained in a porous pot which itself is surrounded by a saturated solution of copper sulfate contained in a copper vessel which serves as a copper plate

electrode, or in a glass jar containing a copper electrode.

3. The *Le Clanche Cell* consists of a carbon plate and a zinc rod immersed in a solution of sal-ammoniac. The carbon plate is surrounded by manganese dioxide, which serves as a depolariser.

4. The *Gravity Cell* is a form of Daniell Cell used extensively in telegraphy. In it the liquids are kept separate by gravity, the $CuSO_4$ resting at the bottom while the $ZnSO_4$ solution floats above it.

5. The *Dry Cell* is a modification of the Le Clanche's Cell composed of a central carbon rod surrounded by a stiff paste of manganese dioxide, plumbago and gum; this is surrounded by a zinc cylinder, the intervening space being filled with a thin paste formed from plaster of Paris and solution of sal-ammoniac.

6. The standard *Clark Cell* consists of electrodes and zinc and mercury immersed in a paste of mixed mercurous and zinc sulphates. Its electromotive force is 1.433 volts at a temperature of 15° C.

7. The *Standard Weston Cell* consists of an amalgam of mercury and cadmium, and cadmium sulphate. The electromotive force is 1.019 volts at 20° C. It is now extensively used for very accurate potentiometer measurements.

8. The *Storage Cells* are secondary battery cells. They are used in electric motor vehicles, and telegraphy. The plates are heavy lead grids full of holes containing the active material, red oxide of lead, PbO_2 and spongy lead, with dilute sulphuric acid as an electrolyte.

Thermocouple. A device composed of wires having different kinds of metals at the two junctions. Temperatures at one junction different from the other give rise to thermal electromotive forces which enable one to measure the temperature accurately. The temperature of the cold junction is kept constant by means of a constant temperature bath or thermos bottle.

Thermo-pile. A form of thermocouple used to detect small differences of temperature but composed of a series of these thermal elements.

Radio-micrometer. An instrument which is used to measure the intensity of radiation.

Fig. 37. Crooke's Radiometer.

Thermogalvanometer. An instrument in which the heating of a wire is used to measure small alternating electromotive forces and the intensity of wireless waves.

Thermo-electric Pyrometer. A form of thermocouple used in measuring high temperatures. They are made of rugged construction when used for industrial purposes being protected by iron or other metal tubes.

Faraday's Disk Dynamo, the first magneto-electric generator, consisted of a copper disk mounted upon a shaft so that it could be rotated. Permanent magnets or electromagnets furnished a strong magnetic field which passed through the disk. When the disk was rotated there was an electric potential generated in it proportional to the rate at which it cut the magnetic lines of force. This was invented by Michael Faraday in England about 1830.

Magnetic Damping. Is used in such instruments as a watt-hour meter. A disk generally of aluminum, is connected by gears to the meter movements so that it rotates slowly when the meter is operating. The disk passes between the poles of one or more electromagnets and being a solid conductor eddy currents are generated in it proportional to the velocity at which it rotates. A sudden momentary impulse from the meter would normally tend to cause it to over register due to the momentum of the movements were it not for the damping effect of the eddy currents within the disk.

Oscillograph. An instrument designed to enable the operator to see the form of an electric wave. The magnetic type consists of a delicate moving element in a permanent field of high intensity. A mirror on the moving element reflects a beam of light over a stationary ground glass or a photographic plate. The Cathode tube oscillograph operates by deflecting a sharp beam of Cathode rays, which strike a fluorescent screen, so as to trace out the wave form visibly.

Loud Speaking Telephones.

Extraordinary interest has been aroused in recent years in the problems of the loud-speaker owing to the popularity of broadcast reception. The present loud-speaker is an instrument that has been practically developed by trial and error rather than by theory and only gives a fair reproduction of the original sounds. This is only part of the problem for the difficulty lies in securing considerable intensity and it is the variety of transformations which makes this serious. First the electrical fluctuations are amplified, then the transformation of these into acoustic variations of air pressure, and lastly the disposal and propagation of these acoustic vibrations. There are many distinct devices adopted for the sound transformation such as *electrostatic, electromagnetic* and *thermal.* The original electrical disturbance is not a simple harmonic one but a highly coupled one which is analyzed scientifically into its various components as far as possible. The familiar physical phenomenon of resonance is one way of securing loudness but this emphasises certain selected components as is true for many telephonic diaphragms. If these frequencies are of audio frequency it is necessary to damp the diaphragm which of course again reduces its sensitivity for other ones also. One method adopted is to use a strip of thin metal foil hanging in the magnetic field between two magnetic pole pieces. The varying telephonic currents traverse the strip and cause it to vibrate across the field in a corresponding manner giving rise to acoustic effects. Horns are really a disadvantage because they resound. The

transmitting and receiving rooms should be lacking in resonant effects to eliminate echoes and distortions. This is secured by draping the walls and windows and covering the floors with carpets.

Dynamo consists of an armature which carries a number of conductors on its surface, and parallel to its axis of rotation. The armature is mounted between the poles of a magnet and when rotated an electric current is obtained from sliding contacts which make connection with its conductors. When a conductor cuts through a magnetic field an electric potential is generated in it.

Electric Motor. (History) Faraday in 1821 caused a floating bar magnet to revolve upon a central supporting wire by means of an electric current. Barlow, of Woolwich in 1826, made an electric wheel. Abbe Dal Negro, of Padua, in 1830, made an electric pendulum which swayed backward and forward by the force of a current of electricity. Henry's electro-magnets (1828) supported thousands of pounds weight; and in 1831 he devised a simple form of motor. This was followed by motors by Sturgeon (1832), Jacobi, (1834), Davenport (1834), Zabriskie (1837), Davenport (1837), Page (1838), Walkley (1838), Stimson (1838), Page (1839), Cook (1840), Elias (1842), Lillie (1850), Neff (1851) and Page (1854). As early as 1835, Davenport made a small circular electric railway at Springfield, Mass. In 1839, Jacobi made an electric motor boat and carried 14 passengers at a speed of 3 miles an hour. Davidson, a Scotchman, propelled a six-ton electric car 4 miles an hour (1839), Page's electric locomotive drew a train of cars from Washington, D. C. to Bladensburg at a speed of 19 miles an hour (1854). So far the propelling force was the voltaic battery. The modern electric dynamo will drive another dynamo in the opposite direction when the two are connected by wires.

Motor. A device for changing electric to mechanical power. When two magnetic fields meet there is a tendency for them to repel or attract each other depending upon their relative polarity. A motor is mechanically the same as a dynamo, the difference being that a current is fed into the armature in the case of the former. The field set up around the conductors reacts with the field of the machine and rotation is obtained.

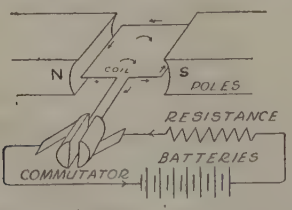

FIG. 38. Principle of Electric Motor.

Standards of Inductance are inductances of known value, rigidly constructed so as to retain their intended values. Such inductances may be fixed or variable. The former consists of a coil of wire wound upon a non-magnetic form and mounted in a suitable casing with accessible terminals. A variable inductance consists of two of such inductances in series one of which may be moved to or away from the other, producing a variation dependent upon the mutual inductance between the two.

Induction coil. A form of the transformer, differing in that its input is direct current and its output a pulsating alternating current. An induction coil consists of an iron core and two coils of wire thoroughly insulated. The primary coil next to the core consists of a few turns of heavy wire which are connected to a direct current source such as a battery. In series with the primary coil is an interrupter, either of the magnetic or mechanical type. The pulsating current in this coil creates a pulsating magnetic flux which cuts through the secondary coil and produces an induced electromotive force greater than that in the primary by an amount proportional to the ratio of the turns in the two coils. The secondary coil sometimes consists of miles of fine wire because the potential to be secured by induction depends on the ratio of the number of the turns in the two coils. A condenser is generally connected across the interrupter to assist in getting sharper breaks of the primary current.

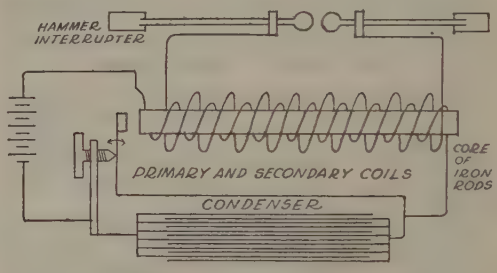

FIG. 39. Induction Coil.

Hammer Interrupter. A magnetic device for rapidly interrupting a direct current circuit. It is used chiefly on induction coils. The current magnetizes the iron core and this attracts the armature of soft iron. As the armature moves toward the face of the core the contacts are opened automatically and the current ceases to flow. The spring returns the armature to its normal position when the contacts again close and the entire cycle is again automatically repeated. The frequency of interruption depends upon the period of the armature and spring and upon the adjustment of the contacts.

The Tesla Induction Coil has a primary of five or six turns, well insulated, which is connected in a tuned high frequency circuit. The secondary is a single layer of insulated wire wound upon an insulating tube. Electrical oscillations of extremely high frequency are produced in this secondary.

Leyden Jar. A glass vessel coated separately upon both sides with tin foil to form a condenser. Its electrical capacity is very small but it is extensively used with most forms of friction electrical machines.

Spark Gaps are of three general types: 1. *Plain*, 2. *Quenched*, 3. *Rotary*. The first type consists of two insulated electrodes between which the current is allowed to jump. The second type

allows the sparking to take place in an enclosed space, filled with gas under pressure. The third type consists of a rotating disk bearing contacts which act like stationary electrodes at certain intervals. The spark can only take place when the electrodes are opposite. Between sparking periods the condenser is allowed to charge up.

Rays emitted by radio-active substances:

Alpha rays are considered to be positively charged particles moving with a velocity about 2×10^9 cm. per sec. which is about one-fifteenth that of light so that they are only slightly deviated by a strong magnetic or electric field. The mass of each particle is 6.2×10^{-24} gm. and they carry an electric charge of 3.182×10^{-19} coulombs and their range of penetration in air at atmospheric pressure is about 7 cm. They are almost the fastest projectiles known in nature. They possess the greatest relative energy for their size.

Beta rays consist of negatively charged particles moving with a very high velocity about 2×10^{10} cm. per sec. which is two-thirds that of light and they are strongly deviated by a magnetic or electric field. The mass is about 1/1850 that of hydrogen atom and they carry a charge of 1.591×10^{-19} coulombs. These are the only natural projectiles faster but lighter than the alpha particles. They are ten times as fast but about one-eight-thousandth the mass in comparison.

Gamma rays are considered to be similar to X-Rays only of shorter wave length and higher frequency having a wave length about 1×10^{-10} cm. being of the nature of wave pulses in the ether. They are more penetrating than the Alpha or Beta rays.

Cathode Rays are beams of electrically charged particles (electrons) of very high velocity produced in intense electric fields. The range of velocities is usually from about twenty thousand to one hundred and twenty thousand miles per second. When stopped suddenly by a metallic target they give rise to X-Rays.

X-Rays are produced by bombarding a solid substance with cathode rays. One explanation is that when an electric charge is suddenly stopped a plane sheet of magnetic force moves forward with the velocity of light. It is definitely known that the rays originate at the point of impact. The velocity of the bombarding electrons constituting the cathode rays is usually about one hundred thousand miles per sec. or about one-half that of light.

AUTOMOBILE.

The motor car or automobile is usually propelled by electric, steam or gasoline power, and is generally so classified.

Automobile, The Gasoline, has from four to twelve cylinders with the pistons acting around on one long common crank shaft. The principle is that of the internal combustion engine and energy is supplied intermittently by two explosions per revolution for a four cylinder, three explosions per revolution for a six cylinder, and four explosions per revolution for an eight cylinder engine.

Engine of a Gasoline Auto. Requires a *cooling*, a *lubricating*, a *carburetor*, and an *ignition system*. Cooling of the cylinder walls is necessary to permit lubrication and prevent the lubricating oil from burning away too rapidly. This is done by air and the use of long thin metal pins projecting from the cylinder walls outside or by water, circulating from the cooling radiator to the water jacket surrounding the cylinder walls.

Lubricating system, is very essential and oil is either splashed or pumped to all bearings around a rapidly rotating part. In some types, the oil is forced through the hollow shafts into the center of the bearings which generally have little curved grooves in them to distribute the oil.

Carburetor. A device for controlling the mixture of the explosive mixture of air and gasoline. The outward suction stroke of the piston draws air and gasoline in about the correct proportions into the manifold or tube leading to the various intake valves for the cylinders. The proportions of gasoline to air must be changed for efficient working when operating under different conditions such as starting or running at low or high speeds.

Ignition system includes a *spark plug*, a *timer*, an *induction coil*, and a *storage battery* or a high *tension magneto*. The timer is a device run by gears from the crank shaft like the magneto and regulates the time of passage of an electric spark between the two insulated metal points in the spark plug at the head of each cylinder so as to ignite the explosive mixture not only when the piston is making its proper stroke but also at the most effective part of that stroke depending on the speed of the engine.

Storage Battery. Consists of a series of insulated and perforated lead plates, whose surfaces have been especially treated, supported in an electrolytic solution of dilute sulphuric acid of density between 1.250 to 1.300. A hydrometer is used to determine if the density falls below 1.200 when the battery needs recharging. Only distilled water sufficient to cover the plates should be supplied to take care of evaporation.

Chassis. The skeleton frame of the car.

Tonneau. The rear seat division of a touring car.

Hood. The car cover which encloses the engine, protecting it from dust and rain.

Running Gear. The term applied to the tires, wheels and axles.

Differential. The mechanical part usually on the rear axle consisting of a carefully arranged assemblage of gears which communicates the motion from the engine main crank shaft passing through the clutch, transmission and drive shaft onto the wheels. It permits one wheel to turn at a different rate of speed from the other so that the car can navigate corners and turns successfully.

Transmission. Particularly applied to that part of the driving mechanism which permits a selection of the suitable speed and driving power by means of a proper combination of gears. For starting or for climbing a low axle

speed is desirable with lots of power which means a high speed of the engine.

Steering Device. Formed by an endless screw working in a worm wheel which enables one to make small changes in direction of the front wheels.

Starter. An electric direct current motor supplied with electrical energy from the storage battery. A special spring and system of gears enables it to drive the main crank shaft so that the pistons are made to move in the cylinders and draw in the explosive mixture which is then automatically ignited.

Clutch. A coupling connecting the main crank shaft with the transmission shaft by means of friction generally. There are various forms such as the cone or the multiple disk.

Brakes consist of two parts, the service brake operated by the foot, and connected to an asbestos lined steel band acting by friction on drums attached to the driving shaft and the emergency brakes of similar mechanism acting on the wheels of the car. Originally the emergency brakes were only applied to the rear wheels of a car but they are now arranged to operate on all four in some models, which is a considerable improvement in many respects.

RADIO.

The remarkable achievements in radio communication during recent years are the result in the main of purely scientific investigations carried on by the pioneers. Clerk Maxwell, Hertz, H. A. Lorentz, Sir J. J. Thomson and O. W. Richardson, who were actuated solely by a desire to learn more about the underlying principles of nature. Lord Kelvin predicted in 1853 from mathematical reasoning that the discharge of a Leyden jar would be oscillatory which was proved experimentally in 1857 by Feddersen. In 1865, Clerk Maxwell developed the electro-magnetic theory and he predicted the existence of wireless waves in space which Professor L. H. Hertz later discovered about 1888. The electron theory was later developed by Lorentz, Thomson and Richardson.

Edison about 1880 discovered that a plate inserted in a carbon filament incandescent lamp was able to cause an electric current to flow between the plate and the filament if the plate was connected to the positive end of the filament but not if the negative end was used. Sir J. J. Thomson showed in 1899 that the current to the plate was carried by electrons. O. W. Richardson in 1901 explained the mechanism of the thermionic emission of electrons from the filament. In 1905, J. A. Fleming proposed the use of the thermionic valve as a rectifier for the detection of electromagnetic waves. In 1907 de Forest inserted a grid calling the device the "Audion" which was of much greater practical use. Its development has been very rapid since because of its ability to perform wonderfully well in a number of very important uses.

Terms Used in Radio.

Antenna. The system of conductors used for radiating or absorbing the energy of electromagnetic waves.

Atmospheric Absorption. Term given to the loss of radiated energy due to atmospheric absorption of the electromagnetic waves.

Audio-Frequencies. Those frequencies of vibration which affect the human ear. They are usually between 20,000 and 50 vibrations per second.

Capacity Coupler. An apparatus which joins portions of two radio frequency circuits by means of electric fields. Electrical energy is thus transferred from one circuit to the other by means of electric forces.

Counterpoise. A system of conductors which form one portion of a radiating circuit and is usually situated below the antenna nearer the ground. The antenna itself forms the other portion. Ordinarily the earth is used.

Coupler. An arrangement which permits a transfer of electrical energy from one circuit to another usually at radio-frequency by transformer action.

Detector. A device usually depending on a crystal or vacuum tube which receives energy at radio frequency and changes it into energy that will operate a telephone receiver. The principle is to rectify the incoming alternating current signals into a pulsating direct current.

Direct Coupler. One which magnetically joins two circuits having a common conductive portion.

Ground or earth, is the use of the earth as one plate of a condenser in radio transmission.

Inductive Coupler. An apparatus which joins portions of two radio frequency circuits by means of magnetic forces. The mutual magnetic field permits a transfer of electrical energy from one circuit to the other.

Radio frequencies are those which are higher than about 20,000 vibrations per second, which is the upper limit for audio frequencies.

Resonance or Tuning. The name given to the varying of the inductance or capacity of a circuit in order to cause the voltage to rise to a maximum.

Wave Meter. A set up including an inductance and capacity, which enables one by resonance to determine the frequency and wave length of a circuit.

Radio Receiving Apparatus.

Crystal detectors have replaced the *coherer* as more sensitive detectors of electromagnetic waves. Polished silicon, galena, and carborundum possess the peculiar property of rectifying an alternating current so that when a train of alternating electric impulses is received from the antenna, these are rectified into a pulsating unidirectional current. There is thus only one single impulse given to the electromagnet of the telephone receiver and a click is heard. An audible sound or tone is heard if the number of trains received is sufficient, about five hundred per second or less than ten thousand per second.

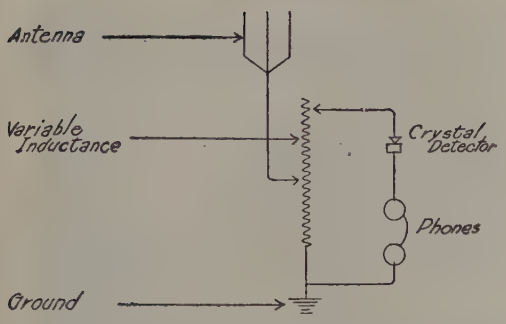

FIG. 40. Simple Crystal Receiving Circuit.

The Audion or Electron Tube is widely used in radio reception. A positively charged plate is mounted in a vacuum tube together with a heated filament and a grid. It has been found by experiment that if the filament is heated to incandescence small negative charges or electrons will be emitted. Some electrons will strike the positively charged plate and current will flow from the plate to the heated filament but not from the filament to the plate. Thus the much needed rectifying action is obtained and on a much larger scale than with the crystal. The filament is supplied from a small battery and controlled by a rheostat. By changing the voltage across the grid the flow of electrons can be greatly affected. The electrons pass through the holes in the grid and strike the plate in the rear of it and there give up their electrical charge. If conditions are properly balanced a small change in potential at the grid will produce a large change in the flow of electrons or the current through the plate which goes to the ear phones. The phones are in series with a high voltage battery which assists in actuating the diaphragms of the ear phones.

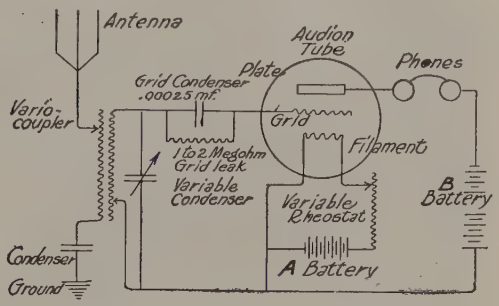

FIG. 41. Single Tube Receiving Circuit.

Audion Detector with one-step amplification. In radio reception one tube is not sufficient to give loud enough signals. It then becomes necessary to increase the intensity of the incoming audible vibrations. This can be accomplished by increasing the amplitude of the vibrations or by passing the audible vibrations from the first detector tube to a second tube through a one to one transformer. From the secondary of the transformer one terminal is connected to the grid and the other to the negative terminal of the A and B battery which is an exact duplication of the detector tube. The one to one transformer is used as this is an inductive coupling and due to its high impedance will damp out any higher harmonics or high frequency oscillations.

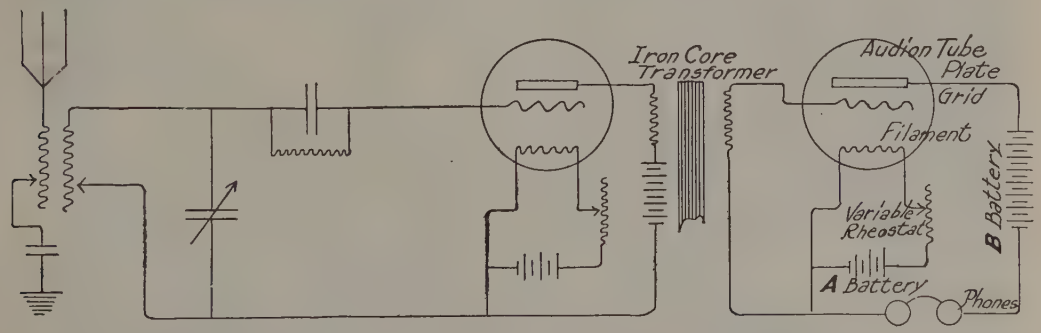

FIG. 42. Two Tube Receiving Circuit. One Detector Tube, One Amplifier.

Tele-Transmission of Pictures.

Tele-transmission of pictures is the transmission of photographs over long distances by means of the telegraph lines of communication. The method is to use certain particular frequencies of alternating current different from the ones regularly in use over the lines which are used for ordinary commercial telegraphy or long distance speech communication. These superposed alternating currents are then sorted out by means of filter circuits at the other end which permit only these special frequencies to pass.

The intensity of current at one frequency acting as a carrier wave is varied by means of a photo-electric cell which receives the impression of the image of a minute portion of the picture to be transmitted. An ordinary photograph is simply built up of light and dark portions. The photo-electric cell is very sensitive to the different intensities of light from these light and dark portions. A lens throws an image of only one very small portion of the photo on the opening to the photo-electric cell at one time. By moving the photo across horizontally in one direction from one side to the other and then raising it vertically step by step after each trip across, the whole photograph is covered. The photo-electric cell in this manner causes the intensity of the telegraphic current to vary in a way

which exactly corresponds to the variations in intensity of the corresponding part of the photograph.

When this fluctuating current is received at the other end of the telegraph wire, suitable apparatus is used which builds up a picture step by step that is an exact duplicate of the original one. In this building up process where the minute impressions are received it is very important that they are put together in their proper succession especially where a new row of impressions is started. The alternating current from a vibrating tuning fork at another frequency is used to govern this and it can easily be made to synchronize the transmitting and receiving apparatus so that they will operate in unison though thousands of miles apart. Unless this is done peculiar distortions of the pictures will result, sometimes giving very ludicrous results.

Tele-transmission of pictures has many important uses such as the detection of criminals by photographs or finger prints, the prevention of forgeries, the expediting of business, where important documents and maps are involved, the selection and direction of moving picture operations at a great distance, and the immediate distribution of the important, the serious and the interesting news of the world by pictures taken on the spot. For military purposes its use is invaluable.

Transmission of pictures may best be considered from four distinct points of view: *tele-autography* which is the transmission of pictures in line; *tele-photography* the transmission of photographs; *tele-vision* the practically instantaneous projection of moving living scenes at a distant point; and *tele-kinematography* where motion pictures are transmitted and then projected for visual observation at a distant point. the prefix "*tele*" comes from a Greek word implying distance. This tele-transmission may be made by wire or by radio. Most of the present methods invented for tele-transmission are only adapted for use on cables and telegraph lines. In tele-transmission one very necessary and important feature is the perfect synchronisur or simultaneous starting and completion of the motion of the respective apparatus at each end so that both work together in unison although possibly thousands of miles apart.

This effect is generally achieved by sending over the line a controlling current, which is made to actuate a relay and so operate the armature of an electro-magnet which controls the speed and action of the recording apparatus in the receiving end. This current does not otherwise affect the messages or signals sent.

Nearly all methods of tele-transmission employ either a photo-electric or a selenium cell both of which are very sensitive to the intensity of incident light. In the first case, an intense beam of light generates a photo-electric current while in the second case, it lowers the resistance offered by the selenium thus permitting a greater current to pass.

The pictures sent may be of varied kinds including thumb or finger prints, architectural drawings or landscapes, photographs, autographs, cheques, moving picture scenes, topographical maps and military plans and even Chinese script. The importance of these various possibilities obviously promises a very wide field of usefulness.

Radio-Transmission of Pictures.

The radio-transmission of pictures is a method of sending and receiving pictures by radio communication through space alone without the use of cables, telegraph or telephone wires. There are several methods which can be adapted readily enough for transmission by radio. The following paragraphs present a very brief outline of one of the most successful yet simplest inventions of this sort. This will indicate the usual methods of overcoming the difficulties involved It is called the Bartlane system after the English inventor, Mr. Bartholemew, director of the *London Daily Mirror*, and Captain McFarlane, a research engineer.

Instead of linking up the stations at each end electrically with the resulting difficulties of synchronism the picture is transformed into a series of holes in a row punched into a long tape.

In transmitting words each letter or number is represented by various permitations and combinations of five punch holes made by a special magnetic typewriter. Another hole in the tape along its center line serves for synchronizing the initial transforming with the final reproducing apparatus.

In transmitting pictures, five shades of photographic density for a minute section of the picture are used ranging from pure white to pure black by fifths. In a positive photograph where it is pure black this is represented by all five punch holes in a row because the photographic negative is pure white at this point and the transmitted light acts on plates which are covered initially with an insulating material and causes this to be chemically removed. Five different timed exposures are made to secure the tone value for each small section of the picture and the corresponding tone plates which are afterwards used as contact plates to control the operation of the punching magnets.

A pure white is represented by no holes being punched. A sixth smaller hole is the synchronising hole. The tape with its code-like message of holes can now be handed over to the cable, telegraph, or radio office and transmitted like an ordinary message. A picture reproducing machine at the other end, then transforms the tape received at the distant point into a duplicate of the original. The principle here is simply that the five punch holes representing the pure black of the original photographic positive will transmit more light than a smaller number. Light from an arc light is sent through them and then the little beams of light are focused by a lens on to a photographic film.

This Bartlane system is quite typical of other inventions that could be used and we can therefore say quite definitely that the transmission of pictures by radio or telegraph or cable has been successfully solved with its resulting benefit for mankind.

TELEVISION

The process of television can perhaps best be understood by following it through from the scene to be transmitted to the ultimate reception. It is first necessary to have the scene brightly illuminated. This was one of the obstacles to early television, for before more sensitive apparatus was devised the illumination had to be so intense that television was confined to inanimate objects. At the present time bright sunlight is sufficient. A second method of illumination, now largely used, is to employ a small intense spot of light only. This travels over the scene and is always at the spot at that moment being transmitted, for a picture is televised a bit at a time.

The second essential part of the transmitter is the *scanning disc.* This takes various forms but the one coming most commonly into use is a large disc two or three feet in diameter, sometimes more, which has around its edge a spiral row of holes. These begin near the outer edge and spiral in toward the center, the innermost one being about two inches nearer the center of the disc than the outer one. These holes must be so spaced that as one is just leaving the scene the next is just reaching it, thus if the disc were stopped only one of these holes would be before the scene. As the outermost hole passes across the scene it scans one strip, as the next hole passes it crosses an adjacent strip just below the first. This goes on until every hole passes across. The disc has then made one revolution and the scene has been scanned once. The process is like reading a page a line at a time. This scanning process must be repeated not less than ten times a second and preferably sixteen times if the picture received is to be devoid of flicker or any appearance of unsteadiness. The eye is so constructed that vision persists after the stimulus is removed for a sixteenth to a tenth of a second. Thus if the picture appears again within this time it seems never to have been removed.

The next piece of the apparatus is the *photo-electric cell.* This device is a glass bulb containing a central wire electrode, which has part of its inner surface coated with an oxide or a hydride of one of the alkali earths. When light strikes this surface electrons are emitted and, if proper connections are made electrically, a current will flow through the tube which will have a current value in proportion to the light which strikes it. This forms the tie-up between the scene and the electrical circuit.

If the subject is wholly illuminated, as opposed to the spot system, the cell is placed behind the scanning disc and as each hole passes in front of it successively, it receives a varying amount of light which follows the change of shading of the scene as the hole passes from one side to the other. If the spot method is to be used the source of light is behind the disc and casts its beam through the hole onto the subject. In this case the photo-electric cell, or sometimes several of them, is placed anywhere in front of the subject and reacts to the light reflected from the scene where the spot strikes it. It is interesting to note that it need not be dark except for the spot as a low constant level of intensity causes no fluctuations in the cell, and that, although the spot is of great intensity, it causes no discomfort to a person being televised. It passes over him so quickly that he is even unaware of its presence.

The light variations of the scene having been transformed to electrical variations these are amplified and sent out in the usual way by radio or by land wire. This part of the system is the familiar one either of radio or telephony as desired.

At the receiving end the signals are received in the usual fashion and amplified. If these amplified signals are applied to the usual loudspeaker, the picture will be "heard" as a series of "squeals." The sound has been described as like that of a high speed circular saw slightly off center. Ordinarily the signals are fed directly into a *neon glow-lamp.* This lamp takes various forms. In general it consists of two electrodes in a glass tube in which is neon gas under low pressure. When a current passes through the tube it glows with an amber-red glow, the intensity of which is in proportion to the current flowing. It is capable of following variations of as much as 100,000 per second. In this respect it is admirably suited to this work, but on the other hand its low intensity limits the size of the possible picture to but a few inches.

In front of this there must be placed a scanning disc, although it might better be called a projector disc, which must be exactly similar to the scanning disc used at the transmitter. It must turn with the identical speed of the transmitter disc. As the light from the neon lamp passes through each hole in succession as it sweeps across a translucent screen the image of the original scene is formed.

The necessity of having the disc at the receiving end follow exactly the speed of that at the transmitting end has been a stumbling block to television. It requires that in addition to sending the television signal there must also be sent a synchronizing signal. This must be sent on a separate wave-length and so filter circuits are necessary in the receiver to separate the two wave-lengths and assign them to the proper outlet. Otherwise, two complete transmitters and two complete receivers are necessary. The synchronization is brought about by the use of motors whose speed is dependent upon the frequency of the current supplied to it. Not only must they turn at the same speed but they must be in the same relative position at the start. If not, the received picture will not be centered. The effect will be the same as if a picture were cut through the middle and what was the left half put on the right side. This condition is remedied after it is seen to occur by a manual adjustment. It causes no difficulty.

This simple system has had many variations. In one case a large screen was built which consisted of what was essentially 2,500 neon lamps and instead of a scanning disc a scanning commutator was used. This lighted the lamps, the one after another, the intensity of illumination of each one being in proportion to the light or shade of the spot of the scene corresponding to that particular lamp. This of course required 2,500 electrical circuits which makes it much too complicated for ordinary use.

Color television has been accomplished in a small measure by using various gases and vapors in glow lamps so as to give the effect of the three primary colors and then projecting them through the scanning disc alternately. The colors have not, however, been good enough to be considered satisfactory.

Noctovision is a process of television in which the scanning is done by invisible rays. While the scene appears to be wholly in darkness it is nevertheless transmitted as usual and viewed as usual.

Framing. The process by which the picture received in television is centered in the frame in which it is to appear. If this is not done properly the picture will be divided. This effect is similar to that frequently seen in motion pictures where the top half of an object appears below the bottom half. In the case of a man, for example, one might see the legs from the waist down and below this the head down to the waist.

Ghosts. When the image appears twice on the screen at the same time, one image being correctly and the other incorrectly framed, the fainter one is called a ghost. One is due to directly received radio waves and the other due to radio waves which have followed an indirect path, reaching the receiver by a reflected route.

Glow Lamp or Neon Tube. A small bulb containing neon under low pressure. This lights up when a current flows through it in proportion to the amount of current. It is the heart of the receiving set as this light varying in intensity with the incoming signal is the thing which forms the image. It is capable of following as many as 100,000 intensity changes per second. Since its intensity is but feeble the size of the image which can be formed by it is only a few inches square. More powerful lights are necessary before pictures can be projected on large screens. Nevertheless it is this lamp which has made television possible. This lamp is sometimes called also a neon tube.

Phonovisor. This is a device by means of which the incoming television signals are recorded on a wax record similar to a phonograph record. When the record is "played" the signals are re-created and the television receiver produces the picture. The picture can be "played" in this manner as often as desired.

Photo-electric Cell. This is a glass tube which has one of the oxide or hydrides of the alkali earths coated on its inside surface except for a small hole or window. When one terminal of a battery is connected to this surface and the other to a wire which is placed at the center a current will flow when light falls upon the cell. If a well constructed cell is used the current is proportional to the amount of light which strikes it. This is the heart of the television transmitter for it transforms light signals to electrical impulses. These are used to modulate the carrier waves of a radio transmitter just as the voice is ordinarily used in radio transmission.

Scanning. In television the whole picture is not sent at once but is sent piece by piece. This is analogous to reading this page. You do not read it by merely looking at it. You must proceed from the top, word by word, and line by line. This is exactly the process used in television and it is called scanning. A picture must be scanned not less than ten times per second and preferably sixteen times per second in order that all flicker or evidence of scanning may disappear and the picture appear complete.

Scanning Disc. This disc takes various forms but the one coming most generally into use is simply a large circular disc with a spiral row of holes starting near the outside and running in toward the center. While the disc may be two or three feet across, the holes occupy a region about two inches wide around the outside. Light coming from the scene passes through the outer hole, then just as this leaves one edge of the scene the next hole comes in from the other edge. As it is a bit nearer the center it scans another line across the scene and so on until the entire scene has been scanned, when the process is again repeated.

Selenium Cell. Selenium when properly prepared has the property of changing its electrical resistance when illuminated. Thus if a current is flowing through it the value of this current will change with changes in illumination. This fact was made use of in early experiments on television. The selenium cell has, however, been discarded in favor of the photo-electric cell. This is because the selenium cell does not respond at once but lags behind the light changes. This is referred to as "lag." It also "fatigues" or becomes less sensitive after it has been used for a time.

Synchronization. It is absolutely essential that the scanning disc at the transmitter and the corresponding disc used in the projection system at the receiver should turn at identically the same speed. This problem is very much like trying to run two phonograph records in exact unison thousands of miles apart. This is accomplished by use of synchronous motors. If the two discs are not exactly synchronized the received image will appear askew.

Synchronous Motors. Motors whose speed depends not upon the power put into them but on the frequency of change of the current used. They are necessarily alternating current motors. If the same frequency is supplied to each of them they must of necessity turn at the same speed.

COLORED MOTION PICTURES

In 1861 Clerk Maxwell showed the first colored picture before the Royal Institution of England. He had taken three photographs, each one through a separate color filter, the three of which, taken together, made up the three color components which produce white light. Red, green, and blue in proper proportions will do this. Using the same filters placed before lenses he projected these pictures so that they fell upon each other on a screen. The result was a colored picture on the screen. This method of taking more than one picture behind complementary filters and projecting them through the same filters is the idea back of every colored picture scheme of any note except one.

To avoid using three plates the plan of taking the pictures behind a plate ruled with colored lines 200 or 300 to the inch has been used. This in effect makes the plate into a great number of closely adjacent photographs, so close as to ap-

pear as one to the eye. Another plan has been to sprinkle the plate with finely divided transparent starch grains which have been dyed the three primary colors. In the first case the same ruled plate must be used for viewing and it is difficult to line this up with the photograph. It would be particularly so, if not impossible, in motion pictures. In the latter case the starch grains stay right on the plate and this difficulty is avoided. It is known as the *Lumière process.*

The only exception to this plan is the *Lippman process* which depends upon interference of light waves. In this case the plate is backed with a mirror so that the light is turned back upon itself. The returning light waves meeting those oncoming result in points of minimum and maximum disturbance so that the plate is affected in layers whose distance apart depends upon the color. When viewed at the proper angle in white light the original colors are reproduced by this filter of layers. While theoretically perfect it does not work out well in practice.

In motion pictures it would be possible to produce colors by taking three separate pictures and reproducing them by superimposing the three projected films on the screen. This would be costly and would require close synchronism of the films. Another system which has been used is to employ but two complementary colors and photograph on both sides of the film, the film having an emulsion on each side. Difficulty of developing and the fact that the colors are not particularly good have made this system unsatisfactory.

The system used in the Cinékodak system of the Eastman Kodak Company resembles most nearly that of the ruled plate. In this case, however, the narrow strips of the film exposed to each of the three primary colors is brought about, not by placing a closely ruled filter before the film, but by placing a large filter having each of the primary colors in its make-up and then splitting these up into fine strips on the film by using tiny cylindrical lenses running lengthwise the film. These are on the side toward the lens and the emulsion is on the back. The lenses made of the celluloid of the film itself focus approximately on the emulsion. Under magnification the appearance of the film is corrugated. Each of these tiny lenses focuses an image of the tricolored filter on the emulsion.

In projection the system is simply reversed. Light passes through the film and through the lenses, then through the projection lenses and finally through the filter and onto the screen.

For each of these embossed celluloid lenses on the film there will be three color strips running lengthwise the film. If only red is present on a particular object only this line will develop out and become transparent. This will allow the light to pass through in the process of projection. It should be noted that the film is used just as it is taken and is not printed out. Thus if only one photograph is taken no other prints can be made from it. This is the great disadvantage commercially as a motion picture producer requires many hundreds of copies. Also the filter cuts out so much light that the system is limited to a screen suitable in size for amateur uses only.

Colored pictures having been produced and sound pictures becoming common; Stereoscopic pictures having been shown and pictures having been sent by radio, it is not unreasonable to expect that we may eventually have colored, stereoscopic, talking pictures sent into our homes by television.

Cinékodak. A system of amateur colored motion picture photography for amateur use developed by the Eastman Kodak Company of Rochester, N. Y.

Complementary Colors. Any two or more colors which when added together, as by projection and superposition on a screen, produce white light. Red, Green, and Blue, in proper proportions will do this. It should be noted that this refers to light beams. It would not be true of colored pigments taken from an artist's box.

Filter (light). Any colored glass or other device which will remove light of certain colors and transmit others.

Interference of Light. When light beams of the same color come together under certain conditions they may produce darkness. Based on the wave theory the explanation is that the crests of one beam strike the troughs of another and so the beams nullify each other. In white light some colors may be blocked out and others reinforced in this way.

Lippman Process. A process of color photography which utilizes the phenomena of light interference to produce the color. See general description of colored picture methods.

Lumière Process. A process of color photography using dyed transparent starch grains sprinkled over the plate. See general description of colored picture methods.

Primary Colors. The primary colors are red, green, and blue. These three added together in proper proportions make white light.

SOUND MOVIES

Sound movies can be divided into two classifications; those in which the picture film and the sound record are separate and distinct and those in which the sound record is along the side of the picture film. The first of these is typified by the *Vitaphone,* the second by the *Movietone* and the *Phonofilm.*

In the Vitaphone the picture film is of the usual type used where pictures are unaccompanied by sound. The sound is on a phonograph disc, similar but larger than that used in our homes for years. In making the records the picture and sound record are made at the same time, both records being driven by the same motor or by two motors arranged to be run synchronously. They are reproduced in like manner. While it is necessary that care be taken in starting the two together, the problem is not as difficult as would seem. The film and record are both clearly marked and it is possible to vary considerably from this mark without this slight lack of synchronism between voice and action being at all noticeable to the audience. The sound records are made by a microphone pick-up which is amplified and causes a needle to vibrate making, as a result, the necessary impressions in a soft wax record. The procedure for making duplicates from the master record is the same as that used in the regular phonograph practice.

In the *Movietone* system the sound record is alongside the picture on a strip a tenth of an inch wide. In this case an oscillating current has impressed upon it the modulations due to the sound. The output, connected to a glow tube, such as the Aeo-light, causes it to fluctuate in light intensity. Thus the record is made up of a number of light and dark strips across this tenth-inch space.

The modulated electrical system is similar to that of a broadcast system. Just as the carrier wave in broadcasting is modulated by the voice so the oscillations are modulated in producing the movie sound record. The glow lamp is similar to that used in television projection. It is a low pressure tube containing helium as a rule, although other gases will do. The light intensity produced varies with the current through the tube and it is capable of following very high frequencies.

In another system the sound record is produced without this oscillating system by use of a slit which opens and closes electrically, its width varying with sound intensity. This produces a jagged saw-tooth blackened strip along the edge of the film.

It is interesting to note that the sound energy is changed to electrical energy, this to light and the light effect is stored permanently on the film by a chemical effect.

In reproducing the sound a light is caused to pass through the sound record. Its intensity on the opposite side will depend upon the film density and so changes as the film passes along according to the changes in the light which produced the film. This light falls upon a photo-electric cell which in a suitable electrical circuit, causes the current to vary with the light changes. These variations, amplified and fed into a loud speaker system, reproduce the original sound. The light is changed to electrical energy, this to mechanical and this produces the sound.

In making the record, and in reproducing it, the sound record must run smoothly and not in jumps as does the picture part. At the point on the film where the sound record is originally photographed and where it is finally reproduced the film must be running at constant speed. A few feet of loose film must intervene between this and the jerky picture feed. Thus speech and gesture are not side by side but are a foot or so apart on the film.

Great care must be taken in making the picture to avoid all extraneous noises as these too will be produced. Elaborate sound proof studios have been built as a consequence. Some of these are scientific achievements in themselves.

Aeo-Light. A helium glow discharge tube used in the Movietone system of sound movies. The tube has two electrodes sealed into quartz and a low pressure of helium gas inside. Variations in current from one electrode to the other cause a variation in the brightness of glow of the tube.

Amplify. To increase electrically the current changes produced by the sound. The first slight current changes are magnified by an electrical system corresponding to that used in radio receivers.

Carrier Wave. A broadcast station sends out a carrier wave whenever it is operating even though no sound is coming over it. While waiting for a station announcer, although you hear nothing, your set is receiving a wave of too high a frequency to be heard and too rapid for your loud speaker to follow. If we liken this to a picket fence we may say that the detector tube cuts off the bottom half of this. Whatever we hear corresponds to a pattern of humps and peaks along this fence which might be like those that would be produced by sawing off the fence top along a wavy line. Our set does not see the pickets; it sees only the wavy line. We superimpose this wave on the carrier wave (pickets) by modulating the carrier wave.

Glow Tube. See Aeo-light above.

Microphone. Any device for changing sound waves into electrical variations. There are many types. They correspond to a telephone transmitter in telephony but are usually of much better quality and workmanship. A telephone need only transmit well enough to make conversation understandable. A microphone must be good enough to pick up the finest tone shades from a symphony orchestra.

Modulation. See carrier wave.

Movietone. A system of talking movies in which the sound record and picture record are on the same film. See general description above.

Phonofilm. A system for talking movies in which the sound record is alongside the pictures. See complete description above.

Vitaphone. A system of talking movies in which the sound and picture record are separate and distinct. See complete description above.

CHEMISTRY.

That natural science which treats of the composition of matter, and the changes produced in it when subjected to peculiar conditions, such as heat, pressure, mass, light. Physics is largely a study of the various forms of energy, such as electricity, power, heat, and light, while chemistry deals more particularly with matter. In common with physics, it includes the determination of characteristics which serve to distinguish one substance from another. The physicist is concerned with properties possessed by all substances. The chemist is restricted to those processes in which the molecules undergo some change, for example, the physicist determines the density, elasticity, hardness, conductivity, etc., while the chemist investigates changes in composition, such as may be effected by an electric current, by heat, or when two or more substances are mixed.

The universe from its utmost heights to its deepest depths, is built of matter of some kind. Since chemistry is the science which deals with various kinds of matter, and all industries use the raw material in one form or another, it is clear that chemistry is closely interwoven with the industries of every country. The country that produces the best chemists is apt to be the most powerful and wealthy. The World War was a revelation of the importance of chemistry even though it was used in forms most unwarranted.

Divisions of Chemistry.

In treating the various forms of chemistry, it is found to be divided into two great branches, *organic* and *inorganic*.

Organic Chemistry is the chemistry of carbon compounds. There are more than two hundred thousand organic compounds. It deals with substances obtained largely from animal and vegetable sources.

Carbon and its compounds are extremely important. We learn that they make up our fuel, whether coal, wood, oil, or gas; our lubricants; our foods, our clothing; and they make possible the change from iron to steel.

Hydrocarbons. There are several hundred hydrocarbons. They contain the elements of carbon and hydrogen. Most of these are found in petroleum, natural gas, asphalt, and coal-tar products.

Carbohydrates. A group of organic compounds containing only the elements, carbon, hydrogen and oxygen. These include grape and fruit sugars, cane, malt and milk sugars; the starches and cellulose which make the structural material of the vegetable world; common alcohol, glycerine, acetic, citric and tartaric acids; fats and oils.

Inorganic Chemistry deals with some eighty chemical elements and their compounds, including those of the mineral world. The fundamentals of both branches are the same, and the main reason for division, is the number of carbon compounds.

Biological Chemistry is that division of the science which deals with the vital processes of life, carried on by means of mysterious substances called "enzymes" which as yet have not been obtained in pure state. Nevertheless, they cause chemical changes, without themselves undergoing such changes.

Physical Chemistry explains the processes of chemistry and formulates laws for these processes. It is sub-divided into two main divisions, *electro-chemistry* and *thermo-chemistry*. One division of physical chemistry in which much progress has been made recently is in the study of the properties of gas.

Physiological Chemistry is the study of the chemical nature of substances entering into the constitution of the animal organism and the chemical changes taking place during the life processes of an animal.

Agricultural Chemistry is that branch which treats of the chemical principles underlying the art of agriculture such as the study of soils, manure and vegetable compositions.

Pharmaceutical Chemistry deals with the nature and method of preparation of various drugs and ointments used for medicinal purposes.

DICTIONARY OF CHEMICAL TERMS.

Acetylene. An illuminating gas made by the action of water on calcium carbide. Berthollet, the French chemist, made important discoveries regarding it, while its method of cheap manufacture from calcium carbide was discovered by Wilson, a Canadian chemist.

Acids. A group of chemical compounds which turn blue litmus paper red, have a sour or acid taste, nearly always contain hydrogen, and neutralize alkalis, hydroxids, or bases. They are of great use in the arts and the laboratory, and are among the most energetic of chemical substances.

Acetic acid. Composed of carbon, hydrogen, and oxygen. The chief constituent of vinegar. It is manufactured by oxidizing alcohol by fermentation. It also has a medicinal or surgical use. Impure acetic acid is called pyroligneous acid.

Hydrochloric acid. A gas, as used in every day life. It is dissolved in water, for which it has a great affinity, depending upon the temperature of the water, which will hold from four hundred to five hundred times its volume in HCl. Made mostly in Europe.

Nitric acid. Compound of nitrogen and pure oxygen, forming a colorless, fuming, caustic liquid. It is an oxidizing agent, combines with bases to form nitrates, and is much used in the arts.

Sulphuric acid. Next to human food, the most indispensible article. Manufactured largely in Great Britain. It is the base of all acids. Leading uses are in fertilizer and sodium carbonate manufacture. H_2SO_4 is used in bleaching, electroplating, nitroglycerine, celluloid, and the like.

Alcohol. Ethyl alcohol or spirits of wine is composed of carbon, hydrogen, and oxygen in the

proportion of C_2H_5OH. It is obtained by distillation from starchy substances such as potatoes, grains, rice, etc., after fermentation. The specific gravity of rectified spirit is 0.82 and is equal to 91 per cent of absolute alcohol, which is alcohol deprived of all its water. Boils at 78 degrees C. and freezes at —130 degrees C.

Aldehydes. A group of organic compounds derived from alcohol (C_2H_5OH) by removing part of the hydrogen by the action of an oxidizing agent.

Alkaloids. A group of nitrogenous basic compounds found in plants. Nearly all are very poisonous. Among them are nicotine, cocaine, quinine, strychnine, caffeine, codeine and morphine. They are all of high medicinal value.

Allotrophy. The quality an element possesses when appearing under various forms, with different properties. Carbon is the best illustration, as in a diamond which is pure carbon, graphite, and amorphous, as charcoal, lamp-black, coke, and mineral coal.

Alloys. These are mechanical mixtures and not chemical compounds, since the metals may be incorporated in all proportions regardless of combining weights. The most important are:

Bronze, copper and tin.

Aluminium brass, equal parts of aluminium bronze, copper and zinc.

Aluminium bronze, copper 90 parts, aluminium 10 parts.

Babbitt metal, copper 4 parts, tin 12 parts, antimony 8 parts, and tin 12 parts added after melting.

Bell metal, from 82 to 70 parts copper and 18 to 30 parts tin.

Brass, copper 66 2/3 parts, zinc 33 1/3 parts.

Britannia metal, tin, antimony, copper and brass.

Coin bronze (ancient), copper 96 parts, tin 4 parts, or copper 98 parts, tin 2 parts.

German silver, copper 60 parts, zinc and nickel 20 parts each.

Gold coin, gold 900, copper 75, silver 25 parts.

Gun bronze, 90 parts copper, 10 parts tin, or 89 parts copper, 11 parts tin.

Manganese bronze, copper 88 parts, tin 1½ parts, zinc 8¾ parts, and a little lead, iron and phosphorus.

Pewter, tin and copper, and sometimes lead.

Phosphor bronze, copper, zinc, tin and phosphorus.

Solder, tin and lead for soft solder. Hard solder contains brass.

Speculum metal, 67 parts copper, 33 parts tin.

Statuary bronze, nearly the same as gun bronze.

Stereotype metal, antimony 16 parts, tin 17 parts, lead 67 parts.

Tobin bronze, copper 59 parts, zinc 38 parts, with a little tin, iron, and lead.

Type metal, lead 4 parts, antimony 1 part.

(See also page 610.)

Alum. It is the transparent, glassy, colorless crystals deposited when solutions of aluminium sulphate and potassium sulphate are mixed and concentrated by evaporation; used in dyeing and printing cloth, in tanning and paper making, for hardening plaster, (as in medicine), making wood and cloth fireproof, in purifying water and sewerage. Ammonium and sodium alums are manufactured, the latter is an ingredient of some baking powders.

Amalgam. An alloy of which mercury is always a constituent. Tin amalgam for silvering mirrors is composed of 3 parts of mercury to 1 part tin.

Amids. A large class of organic compounds derived by substituting one or more organic radicals for one or more of the hydrogen atoms in ammonia. (NH_3.)

Amins. A large class of compounds derived by substituting such hydro-carbon radicals as methyl or ethyl for one or more of the atoms of hydrogen in ammonia. (NH_3.)

Ammonia. A gaseous compound of nitrogen and hydrogen, colorless and pungent, formed when ammonium chlorid (sal ammoniac) is heated with lime. The ammonia of commerce is obtained from gas works. When ammonia gas is dissolved in water, liquid ammonia is formed.

Anhydrid. Oxids of non-metals which unite with water and thereby produce acids are called anhydrids. The gas (SO_3) is the anhydrid of sulphurous acid (H_2SO_3).

Anilin. A substance largely used in the manufacture of dyes. It is formed by the addition of hydrogen to nitrobenzene. It was discovered in 1826 by Unverdorben, further demonstrated by Runge (1834), Zinin (1841), Hofmann (1843), and Perkin (1856).

Aspirin is the trade name of Monoaceticacid-ester of Salicylicacid. It is a white powder used in the treatment of headaches, rheumatism, colds, pleurisy and the like. Aspirin passes through the stomach unchanged and liberates salicylic-acid in the intestine.

Atmosphere. A convenient unit for measuring pressures such as the force of steam or pressure of liquids. It is, in English use, the weight of a column of mercury 30 inches high at the freezing point at London; in France, the pressure of 760 millimeters of mercury at the freezing point at Paris; generally estimated at about 15 pounds (14.7) pounds to the square inch. When a pressure of 3 atmospheres is spoken of, about 45 pounds to the square inch is understood.

Atom. The smallest particle of an element which can enter into chemical composition. It is also the indivisible constituent of a molecule.

Atomic Theory. A hypothesis or theory put forward by Dalton in 1805. Designed to explain many states, conditions, and the phenomena in chemistry otherwise incapable of explanation. By this theory it is supposed that all bodies are composed of minute particles of the elements and that these atoms cannot exist in a free or uncombined state, but always in union with atoms of other elements in compounds or with atoms of the same element. Argon and some others are exceptions to this theory.

Atomic Weight. The atomic weight of an element is the weight of an atom of that element compared with an atom of hydrogen, the lightest

of all elements, taken as the standard and called 1 or unity.

Boiling. The rapid production of vapor in the mass of a liquid. Boiling points in degrees Fahr.:

Alcohol, specific gravity 813	173°
Ammonia	140°
Benzine	173°
Chloroform	146°
Coal tar	325°
Ether	100°
Linseed oil	597°
Mercury	648°
Milk	213°
Naphtha	186°
Nitric acid, specific gravity 1.42	248°
Nitric acid, specific gravity 1.5	210°
Oil of Turpentine	315°
Petroleum, rectified	316°
Phosphorus	554°
Sea water, average	213.2°
Sulphur	570°
Sulphuric acid, specific gravity 1.848	590°
Sulphuric acid, specific gravity 1.3	240°
Sulphuric ether	100°
Turpentine	315°
Water	212°
Water in vacuo	98°
Whale oil	630°

Bunsen burner, is an arrangement for burning gas by first mixing it with sufficient amount of air so that a more perfect combustion is secured.

Calomel. An insoluble white substance used medicinally to stimulate the liver and other glands. Calomel decomposes when exposed to light forming poisonous mercuric chloride. For that reason calomel is always kept in dark bottles.

Chemical Affinity. The attraction which one element exerts upon another is called chemical affinity, and in most cases manifests a preference of the atoms of one element for those of another element above all others. Substances like nitrogen which display a low chemical affinity are called inert and do not readily form many compounds.

Chemical Analysis. In chemistry, the breaking up of a compound substance into its constituent elements.

Qualitative Analysis. Deals with the kinds of matter present. It has been found that all substances are made up from about eighty different elements, which are put together in different forms.

Quantitative Analysis. Deals with the proportions by weight or by volume in which they are found in the element. In this analysis we find that carbon and hydrogen are generally estimated by the combustion process, which consists in oxidizing the substance and absorbing the products of combustion in suitable apparatus. The oxidizing agent most commonly used is copper oxide, which must be freshly lighted before use on account of its hydroscopic nature.

Chemical Combination. The intimate union of two or more elements to form a compound with properties different from those of the constituent elements. When no such union exists, a mechanical mixture results, such as the air, in which the constituent gases lie side by side without union.

Chemical Formula. A mode of representing the exact composition of chemical compounds, and stands for one molecule of the compound. The formula of water is H_2O. This means that a molecule of water is composed of two atoms of hydrogen chemically combined with one atom of oxygen; two molecules of water would be represented by the formula $2H_2O$, where the large figure multiplies all that follows. Formulas are empirical, as those given above; rational, as HOH; and graphic, as H—O—H.

Compound. A substance which is made up of elements united in exact proportions, by a force called chemism, or chemical affinity.

Distillation. Heating a liquid or solid in a closed vessel and condensing the vapors is called distillation. A common example is the tea-kettle, when the water boils steam escapes from the spout. If the steam were passed through a cold pipe, it would condense as distilled water.

Element. A chemically indivisible substance, or one from which nothing else can be extracted.

Enzymes. Are secreted by a living organism, thus differing from the inorganic catalysts. It is an interesting fact that a germinating seed (barley, for example) develops enzymes as it sprouts.

Epsom Salts. There are deposits of magnesium sulfate in the western states, which when crystallized from solution at ordinary temperatures Epsom Salts is secured. It is used in dyeing, tanning, soaps and for medicinal purposes.

Ether. Is produced by the action of hot concentrated sulfuric acid in removing the elements of water from alcohol. It is used as an anæsthetic and as a useful solvent for many substances.

Fermentation. A large number of chemical changes are brought about through the direct agency of certain living organisms, such as yeasts and bacteria, or by catalytic agents called enzymes, which these small plants secrete.

Fusion. The change of a body from the solid to liquid state.

Melting Point in Degrees Fahrenheit.

Substances	*Degrees*
Antimony	995
Bismuth	506
Brass	1873
Copper	2000
Gold	2016
Iron, cast	2000–2800
Iron, rolled	3000–3500
Lead	612
Platinum	4593
Steel	2370–2550
Tin	444
Wax	158
Zinc	680–772

Graphite. Commonly but incorrectly called black lead or plumbago. It contains no lead, is an allotropic form of carbon, hence identical in composition with charcoal and diamonds. Occurs as a mineral, is lighter than water. The ore is pulverized, thrown into shallow tanks,

the rock sinking and graphite floating. Large deposits found in Siberia, Germany, France, Austria and United States. Used in manufacturing lead pencils.

Helium. Named "Helium" (from the Greek, "Helios," the sun) by Lockyer and Janssen who first observed it during the solar eclipse of 1868. Discovered on earth by Ramsey in 1895, through treatment of the mineral clevite with acids.

Helium is a light, colorless gas. It is so inactive that it has no compounds. It is given off when various metals are heated and is also found in the waters of certain springs. Most of the commercial helium is secured from the gas wells of Kansas and Texas, the other gases being liquified and the helium collected separately. The U. S. is fortunate in owning the only workable source of helium. Because helium is not inflammable and is less than one-seventh as heavy as air, it is regarded as the most valuable of all known gases for filling balloons and airships. The amount needed for modern dirigibles is enormous. The *Shenandoah* took 2,150,000 cubic feet, the *Los Angeles*, 2,475,000, the *Akron* 6,500,000. See Tables of Chemical Elements.

Hydrogen Peroxide. Prepared commercially by treating barium peroxide with dilute sulphuric acid. It is used for bleaching purposes and as a mild antiseptic.

Iodid. A compound formed by the direct union of iodin with another element; or by replacing the hydrogen or hydroiodic acid (HI).

Iodine. Is obtained from beds of Chili saltpeter and from sea weed. The element is used in medicine as a tincture of iodine for treatment of swellings, and as a germicide.

Ion. An atom or atoms bearing + or — charges of electricity, formed through dissociation of an electrolyte in a solvent as water; + ions = anions; — ions = cations.

Laws of Chemistry.

Avagadro's Rule. Under like conditions of temperature and pressure equal volumes of gases contain equal number of molecules. It was advanced by Avagadro in 1811. It is the basis of the methods of finding the molecular weight of compounds.

Barthollet's Law. When two substances can form a substance insoluble or volatile, under the condition of the reaction, that substance will be formed until one of the factors is exhausted.

Boyles Law. The pressure which a given quantity of air at constant temperature exerts against the walls of the containing vessel is inversely proportional to the volume occupied.

Law of Definite Proportion. In a given compound, the proportion of any element by weight, or, if a gas, by volume is always constant.

Law of Multiple Proportion. Whenever one element combines with another in more than one proportion, it always combines in some multiple, one or more of its least combining weight, or, if a gas, of its least combining volume.

Liquefaction. Reduction to a liquid state. Solids are liquified by heat or solution; gases, by cold and pressure. That temperature below which a gas under pressure may be liquified is the critical temperature; and the pressure necessary to produce liquefaction at the critical temperature is called the critical pressure. All gases which may be cooled to the critical temperature may under requisite pressure be liquefied. The critical temperature of hydrogen is —234 degrees C.; oxygen, —119 degrees C.; nitrogen, —146 degrees C.; air, —140 degrees C.; carbonic dioxid, 32 degrees C.; or 88 degrees F.

Mass. Any portion of substance larger than a molecule. It is an aggregation of molecules.

Methane or marsh gas. Occurs in marshy districts. Formed by a process of fermentation of cellulose or plant fibre by micro organisms.

Coal gas. Contains 30 to 40% methane, 45 to 47% hydrogen, 5 to 12% carbon and small quantities of other substances. Pure methane may be prepared by placing aluminum carbide into warm water. It is not so much the methane which is responsible for the mine explosions, as the fine coal dust, which of itself causes explosion. Nor is it the explosion which creates the greatest loss, miners may in a measure escape this by falling flat on their faces, allowing flames to pass over them, as the blast generally leaves the air on the ground breathable. It is *after damp* which creates greatest havoc. This deals a painless and easy death. Men killed by flames are marked with burns and scorching, when death has occurred by after damp, men lie as if placidly sleeping.

After damp. When methane burns in air, it produces carbon dioxide.

CH_4	+	$2O_2$	=	CO_2	+	$2H_2O$
Methane		Oxygen		Carbon Dioxide		Water

In the mines, there is generally insufficient oxygen for complete combustion, and so another very poisonous oxide of carbon is formed called carbon monoxide. The carbon dioxide is not in itself so poisonous. It is rather the small percentage of carbon monoxide—CO. It is this CO which causes many casualties in sections where natural gas is used as fuel.

Mixture. Is composed of two or more elements or compounds blended together, but not held by any chemical attraction.

Molecule. Is the smallest particle of a substance that can exist alone.

Molecular Weight. The sum of the atomic weights of the constituent elements. In a molecule of water (H_2O) the molecular weight is the sum of two atoms of hydrogen (with an atomic weight of 1 each) and of 1 atom of oxygen (atomic weight 16), making the molecular weight of water 18.

Oxide. Is a compound of oxygen and another element.

Oxygen. A gas without color, odor or taste. The most abundant of all elements. It is the union of oxygen in the air with carbon and hydrogen in our blood that gives body heat, and supports life. It forms a portion of all animal and vegetable matter. It makes up over one-half of the earth's surface.

Paris Green. Is a poisonous green powder used on growing plants to kill potato bugs and

4 Roosevelt Dam and Reservoir, Arizona.

other harmful insects. It can be used as a spray when diluted with water or as a powder when mixed with slaked lime.

Quantivalence. The quantivalence of an element is measured by the number of atoms of hydrogen it combines with or replaces, e.g., Na. is univalent, for when added to HCl it replaces one atom of hydrogen; Ca is bivalent, for, as seen in the above reaction, it replaces two atoms of hydrogen. See Valence.

Quinine. Is extracted from the bark of the cinchona tree. Its greatest medicinal use is found in the treatment of malaria fever. It is also used as a preventative.

Radicals. Is an atom or group of atoms which changes places in a reaction; a compound radical is made up of different sorts of radicals as NH_4.

Reaction or chemical equation. Is a method of representing a chemical change.

Salt. Sodium Chloride or common salt is plentiful in most parts of the world. The chief sources of supply are the water of seas and salt lakes, rock salt, and natural brines. Two-thirds of the solid in sea water is common salt or about 2.75 per cent of the total volume. In contrast to this the Great Salt Lake contains about 12 per cent salt. The great salt producing states are New York, Michigan, Ohio, Kansas, Louisiana, Texas, Utah, West Virginia and California.

Specific Gravity. The specific gravity of a body is its weight compared with an equal bulk of another body taken as a standard of comparison. Pure water is the standard for solids and liquids. Either air or hydrogen for gases. To find the specific gravity of a body heavier than water; weigh the body in air; weigh it suspended in water; find the difference, which is what the body loses in weight when supported in water, or is the weight of an equal volume of water; divide the weight in air by the difference. When the body is a solid lighter than water attach a known weight to the body sufficient to sink it, then weigh in water and proceed as given. To find the specific gravity of a liquid weigh some solid in water; weigh the same solid in the given liquid; then divide the loss of weight in water into the loss of weight in the given liquid; the quotient is the specific gravity required.

TABLE OF SPECIFIC GRAVITIES.
Compared with Water.

Substances.	*Average Specific Gravity.*
Air at 60° F.—barometer at 30 inches	
is 1/815 of the weight of water	.00123

Tin	7.35
Zinc	7.

Strychnine—Nux Vomica—First used successfully as an analgetic in surgery in 1909 by Dr. W. L. Dudley of Vanderbilt University. An alkaloid discovered in 1818 by Pellitier and Caventon in St. Ignatius beans. In taste exceptionally bitter, has an alkaline base, and is a tertiary monacid base. Applied externally, it is a powerful antiseptic, but its poisonous nature prevents it from being used for this purpose. Internally strychnine particularly affects the nervous system, excites the areas of the spinal column. Small doses cause convulsions with death.

Sulphur. The brimstone of the Bible was sulphur. It is a solid non-metallic element found free in volcanic regions. Sulphur is an essential element in all protein material, hence the effensive smelling of certain decaying matter as eggs. The chief supply is found in Louisiana, Texas, and in Italy. Most of our commercial sulphur is mined by a process patented by Herman Frasch, an American chemist in 1890. Borings through the overlying rock are made into the sulphur beds. Then a series of five pipes one within the other is forced into the sulphur bed. Hot water is then forced into the sulphur which is melted. This melted sulphur in turn is forced to the surface by compressed air which is sent down the smallest pipe. Many wells yield 500 tons daily.

Sulphate. A compound formed with sulphuric acid (H_2SO_4) by replacing the hydrogen with another element or radical.

Sulphid. A chemical compound formed by the direct union of sulphur with another element.

Sulphite. A compound formed by sulphurous acid (H_2SO_3) by replacing the hydrogen with another element or radical.

Surface Tension. The magnitude of opposing forces per unit of length of an imaginary line drawn in the surface of a liquid.

Termination "—IDE" denotes a Binary Compound, that is, a substance composed of only two elements, e.g., Sodium Chloride (NaCl).

Termination "—OUS" is applied to the first of two elements when it exists in a greater proportion than in another combination with the same element, e.g., one atom of phosphorous and three atoms of chlorine form Phosphorous Chloride.

Termination "—IC," when the first exists in a lesser proportion, e.g., one atom of phosphorus with five atoms of chlorine form Phosphoric Chloride.

Prefixes "MONO—," "BI—," "TRI—," etc., indicate the proportion of the latter of two elements, and are sometimes used instead of the above termination. Thus phosphorous chloride may be also called Phosphorous Tri-Chloride; so one atom of carbon with one atom of oxygen is Carbon Monoxide.

Prefix "HYPO—" (under) and **"PER—,"** (over), specify compounds formed by the same two elements containing less (or more) of an element than is in the usual compound.

Valence. The combining power of an atom of an element compared with that of hydrogen taken as a standard. Elements which combine atom for atom with hydrogen are called univalent or are said to have a valence of one; those which require two atoms of hydrogen or other univalent atom to saturate one atom of themselves are called bivalent or 2-valent; and so on with trivalent, or 3-valent; quadrivalent, or 4-valent, etc. Many elements seem to possess a varying valence.

Vapor. The gaseous form, which bodies that are solids or liquids at ordinary temperatures, may be made to assume by the agency of heat.

Vaporization. The passage of liquid into the gaseous state.

Yeast. Is one of the most common of living ferments, wild yeast being a microscopic plant found on the ground, and often in the air. Wine is fermented from grape juice by the wild yeast, found on the skins of the grapes.

CHEMISTRY OF FOOD.

Food is anything which taken into the body builds and repairs the tissue or furnishes heat and energy. Food is needed by the animal body to replace wornout tissues, provide for growth in the young, and supply heat to maintain the body temperature. Food is the source of animal energy. When a muscle contracts carbohydrate in the tissue is oxidized and heat liberated.

Four great classes of foods are necessary to human health.

1. *Proteins*
2. *Carbohydrates*
3. *Fats*
4. *Minerals.*

Classification of food.

(A) Organic foods of animal and vegetable origin, include:

1. Protein, or nitrogenous foods composes most of the muscle, brain and nerve tissue, and is commonly spoken of as *tissue builder.* Eggs, milk, beans, lean meat, peas and cereals are representative protein foods. The protein molecule is very complex and very large. Protein always contains carbon, hydrogen, oxygen, nitrogen and usually sulphur.

a. Albumin, as in the white of an egg.
b. Casein, as in milk curd.
c. Extractives, as in the juices of meats.
d. Fibrin, as in lean meat.
e. Gelatin, as found in sinews and bones.
f. Gluten, as contained in wheat.
g. Legumin, as contained in beans and peas.

2. Carbohydrates are those foods which include a large percentage of starches and sugars. These sugars are found more particularly in cane, beets and sweet fruits. On the other hand starches are found in cereals, rice and potatoes.

a. Cellulose, fruit and vegetable fiber.
b. Starch, as contained in potatoes.
c. Sugar, as cane, beet and fruit sugars.

3. Fats or Glycerides produce more heat and energy per weight than any other food. Fats are found in all animals and most plants, where they serve as a store of energy and heat producing material. Animal fats such as tallow, lard, and butter, and vegetable fats such as olive oil, nuts and cocoa butter are representative fat foods.

a. Animal fats, as butter, lard and fat meat.
b. Vegetable oils, as olive oil, cottonseed oil.

(B) Inorganic foods or those not having animal or vegetable origin.

4. Minerals. Lime and phosphorus, are needed in developing bone, while calcium, iron, iodine, potash are all necessary to our well being. Cereals, eggs, fruits, milk all furnish minerals but in this age of prepared foods, it is the province of chemistry to see that the proper amount of minerals are supplied the human body.

a. Mineral matter is found in the ash of foods.

Water is usually not thought of as a food, it is used in tissue building, but it does not give heat or energy.

CHEMICAL ELEMENTS.

At wt. = Atomic weight; Sp. gr. = Specific Gravity. For Definitions see Index

Name of Element.	Mode of Preparation.	Properties.	Chief Compounds and Uses.	Tests and Characteristics.
ALUMINIUM Symbol Al. At. wt. 26.97. Valence III. Sp. gr. 2.69. Discovered by Wöhler, 1827.	Occurs as silicate in clays, micas, feldspars, etc.; extracted from its ores by electrolysis.	A tin-white tenacious metal; takes brilliant polish; odorless, tasteless; highly malleable at 100° to 150° C. Sonorous, does not tarnish; slowly magnetic. Soluble in hydrochloric acid and solutions of caustic potash and soda.	Oxid and sulphate are its compounds. Oxid is sapphire, ruby, corundrum, and emery used in polishing. As a basic oxid, and as an acidic oxid, forms the somewhat indefinite aluminates. Sulphate is aluminium salt prepared by itself and along with potassium or ammonium sulphate as alum. Uses: boat building, instruments, balloon fittings, bicycles, cooking utensils, chemical works, lithography, paint, cameras, opera glasses, and aluminium bronze.	
ANTIMONY Symbol Sb. (*Scibium.*) At. wt. 121.7. Valence III. and V. Sp. gr. 6.69. Disc. by Valentine, 1450.	Occurs in nature in stibnite, antimony sulphid. Found free to a small extent.	A bluish-white, hard, brittle, highly lustrous, crystalline metal. Expands on solidifying; does not rust.	Alloyed to make type metal, britannia metal, and anti-friction metal. Compounds are sulphids; antimony cinnabar, used for paint; antimony trichlorid (butter of antimony) for browning gun-barrels; and tartar emetic.	Tests similar to that for arsenic, from which it is distinguished by the appearance of metal, and its insolubility in sodium hypochlorite.
ARGON Symbol A. At. wt. 39.94. Sp. gr. 1.59. Disc. by Rayleigh and Ramsay, 1894.	A gaseous element nearly one and a half times heavier than air, present in natural nitrogen.	A colorless, odorless gas, chemically inactive.	The argon molecule contains one atom. Used in "gas filled" incandescent lamps.	Argon will not unite with any other element; more soluble in water than nitrogen; liquefied, boils at −186°C. and solidifies at −190° C.
ARSENIC Symbol As. At. wt. 74.91. Valence III. and V. Sp. gr. 5.72. Disc. by Magnus, 13th cent.	Occurs free in nature, but also combined with many metals as in realgar, and in mispickel or arsenical pyrites.	1. A steel-gray, metallic, very brittle solid, subliming easily. 2. A fine, heavy black powder.	White arsenic or arsenious anhydrid (As_2O_3); arsenic oxid or arsenic anhydrid. Used for hardening shot, in paints, as Scheele's green for printing wall paper, dyeing calico, and in pyrotechny.	Marsh's test: arsenic is placed in the apparatus used for generating H; the H is ignited, and, when cold porcelain is held in flame, metallic arsenic is deposited on the porcelain.
BARIUM Symbol Ba. At. wt. 137.36. Valence II. Sp. gr. 3.6. Discovered by Davy, 1808.	Occurs chiefly as sulphate in barite, as carbonate in witherite, in other minerals, mineral waters, ashes of certain plants, and in sea water.	A silver-white or golden-yellow metal, slightly lustrous, somewhat malleable. Melts at red heat, but cannot be distilled. Recent soil analyses have led botanists to believe that the poisonous properties of the loco weed are due to the presence of barium in the soil.	Barium peroxid, used to make peroxid of hydrogen, a bleaching agent, and to prepare oxygen; sulphate, in making pigments, cheap substitute or adulterant of white lead, manufacture of reagents, in pyrotechny, paper making, and pork packing.	Barium salts, when brought into a non-luminous flame, burn with a yellowish-green color. Compounds impart a green color to a Bunsen flame, if volatile; if in solution they form an insoluble, white precipitate on adding sulphuric acid.
BERYLLIUM Symbol Be. At. wt. 9.02. Valence II. Sp. gr. 1.84. Disc. by Vauquelin, 1797.	Isolated from beryl rocks. Now made by electrolysis at 1280° C. Rare as yet.	Dark metal lighter than aluminium and nearly as light as magnesium. Takes high polish. Alloys well with iron.	Combined with oxygen to form white powder, used in gas mantles and in crucibles.	Beryllium salts are hard to obtain, for they dissolve beryllium hydroxide, a unique property. Several compounds possible.
BISMUTH Symbol Bi. At. wt. 209. Valence III. and V. Sp. gr. 9.8. Discovered by Valentine, 15th cent.	Occurs in nature, free, and in combination as sulphid, oxid, and carbonate.	A grayish-white, crystalline, shining, brittle metal with pinkish tinge. Solidifies with expansion.	Used in anti-friction alloys, in plugs for fuses, in sprinkler systems, in stereotype metal, and in medical compounds.	Bismuth is easily refined in oxid or sulphid forms. It renders alloys brittle and impairs electrical conductivity.
BORON Symbol B. At. wt. 10.82. Valence III. Sp. gr. 1.75. Disc. by Gay-Lessac, Thénard, 1808.	Occurs in oxygen compounds, namely, boric acid and its salts in two forms.	An odorless, tasteless, greenish-brown powder. Non-conductor of electricity; very infusible. Melts at 2300° C., and boils at 763° C.	Boron is of little commercial use. Its compounds are boric acid, boric oxid, and borax.	

Name of Element.	Mode of Preparation.	Properties.	Chief Compounds and Uses.	Tests and Characteristics.
BROMIN Symbol Br. At. wt. 79.916. Valence I., V., or VII. Sp. gr. 3.14. Discovered by Balard, 1826.	Occurs in the upper layers of the natural beds of rock salt. Three modes of preparation.	A heavy, reddish-brown liquid. The only liquid non-metallic element. Unites directly with most metals. Boils at 61.1°C. Has a very irritating odor.	Forms a class of compounds known as bromids. Useful in medicine, in photography, and in the manufacture of dyes from coal tar.	Gives a brownish color to starch paste by using a very large quantity. No oxid is known.
CADMIUM Symbol Cd. At. wt. 112.41. Valence II. Sp. gr. 8.6. Discovered by Stromeyer, 1817.	Occurs in the rare mineral greenockite, and in association with zinc ores, in very small quantities.	A bluish-white, lustrous metal with a fibrous fracture, highly lustrous, malleable, ductile, and flexible. It melts at 320°C., and boils at 778°C.	Cadmium forms a series of salts, of which iodid is used in medicine. Its sulphid is used as a pigment, and is also used for coloring toilet soaps, in pyrotechny, and in calico printing.	Cadmium tarnisnes slightly in air, and burns when heated in it.
CESIUM Symbol Cs. At. wt. 132.91. Sp. gr. 1.87. Disc. by Bunsen, Kirchoff, 1861.	A chemical element found in certain mineral waters, and in minerals, including lepidolite, petalite, and certain feldspars. Isolated by electrolysis.	A silver-white, soft, ductile metal; oxidizes rapidly in air.	The preparation of the metallic cesium involves separation of its compounds from other elements, the transformation of the pure cesium compounds into cyanid and the electrolytic decomposition of the cyanid.	Cesium has a great avidity for oxygen, readily taking fire if exposed to air. No oxid is known.
CALCIUM Symbol Ca. At. wt. 40.08. Sp. gr. 1.55. Valence II. Discovered by Davy, Berzelius, 1808.	Found in nature as limestone, marble, chalk, coral, eggshells, and many other forms. Prepared by the electrolysis of calcium chlorid.	A light, yellowish-white, clear, lustrous hard metal; malleable, ductile, brittle; melts at red heat. Decomposes water like sodium and potassium.	Quicklime (CaO) for making mortar; slaked lime for making lime-water; calcium sulphate or plaster of Paris; calcium phosphate as fertilizer; and chlorid of lime for bleaching.	Calcium precipitates as an oxalate, in connection with analysis of limestone or brick containing it. Calcium salts color a flame brick-red, and the spectral bands are yellow.
CARBON Symbol C. At. wt. 12.00. Valence IV. Sp. gr. 1.86. of diamond 3.5: of graphite 2.25 Prehistoric.	Occurs pure in nature, as diamond and graphite or plumbago (black lead); more or less impure as coal; artificially as charcoal, coke, soot, and lampblack.	Its forms are very varied and quite familiar. Unchanged by acids.	Carbon dioxid (CO_2) found in natural and artificial aerated waters; carbon disulphid (CS_2) for dissolving oils, fats, and vulcanizing rubber; the carbonates; and with hydrogen to form hydrocarbons.	Diamond, noted for its hardness, brilliancy, non-conductor of electricity, and burns under intense heat to CO_2. Graphite, a soft, greasy-looking black solid, crystallizes in six-sided plates. Other forms do not crystallize.
CERIUM Symbol Ce. At. wt. 140.13. Valence III. or IV. Sp. gr. 6.8. Discovered by Mosander, 1839.	Occurs with a few minerals, especially as the silicate in cerite, and samarskite. Prepared by electrolysis.	A steel-gray, very ductile, very lustrous, and malleable metal.	Its oxid is an important ingredient of incandescent gas mantles. Cerous sulphate is used in coloring fabrics.	Burns when heated in air, forming an oxid and producing much heat and light.
CHLORIN Symbol Cl. At. wt. 35.457. Valence I. Sp. gr. 1.55. Discovered by Scheele in 1774.	1. Electrolysis of salt water. $NaCl = Na + Cl$. 2. Hydrochloric acid and black oxid of manganese. $4HCl + MnO_2 = MnCl_2 + 2H_2O + 2Cl$.	Greenish-yellow color, pungent odor, irritates mucous membranes, soluble in water. Forms chlorids by direct union with other substances. Bleaches. Condenses to dark yellow liquid; boils at −33.6°.	Chlorids as common salt (NaCl), chlorinated lime, Condy's Fluid, hydrochloric acid (HCl). Uses. Manufactured for bleaching materials and disinfecting agents.	Heavier than air. Bleaches all inorganic substances. Does not bleach printer's ink. Does not burn in air, but many substances burn in chlorin.
CHROMIUM Symbol Cr. At. wt. 52.01. Valence II. to VI. Sp. gr. 7.1. Discovered by Vauquelin, 1797.	Occurs chiefly in ferrous chromite, as crocoisite, as wolchonskoite, and as a constituent of meteoric iron.	A shiny steel-gray powder, consisting of small, lustrous, very hard, brittle, rhombohedral crystals.	With steel it yields an alloy, chromium steel. With oxygen forms oxids, used principally as pigments; chromates, used in calico printing and dyeing, making matches, bleaching, tanning leather, and photo-gelatin processes.	Burns brightly when heated in oxygen. When used in plating it does not tarnish, is harder than nickel, and adheres better to many other metals.

Name of Element.	Mode of Preparation.	Properties.	Chief Compounds and Uses.	Tests and Characteristics.
COBALT Symbol Co. At. wt. 58.94. Valence II. or III. Sp. gr. 8.8. Discovered by Brand, 1735.	Usually occurs with arsenic or sulphur, and with nickel and other metals.	A hard, steel-gray, very ductile metal, resembling nickel, highly magnetic, and melts at 1480°C; unchanged in air.	It forms alloys, and is used in electroplating. Its principal commercial salts are pigments. Its oxid is used for glazing porcelain.	Slowly dissolved by HCl and sulphuric acids, but quickly by nitric acids.
COLUMBIUM (*Niobium*) Symbol Cb. At. wt. 93.1. Valence III. and V. Sp. gr. 8.4. Discovered by Hatchett, 1801.	Found in columbite, tantalite, and in small quantities in other minerals.	A steel-gray, lustrous powder.	Columbium forms three oxids of which the pentoxid forms salts called columbates or niobates.	When heated in air, columbium burns, but is almost unaffected by acids, except it is soluble in warm concentrated sulphuric acid. It has three or more oxids. Related to vanadium and tantalum.
COPPER Symbol Cu. (*Cuprum*) At. wt. 63.57. Valence I. or II. Sp. gr. 8.93. Prehistoric	Found native and as oxids, carbonates, and sulphids, in various minerals. Obtained by smelting, by electrolysis, and now by froth-flotation—collecting the copper, by oil on top of water, from concentrated ores.	A reddish-yellow metal, bright luster, tenacious, sonorous, elastic, malleable, and ductile. Melts at 1083°C. Excellent conductor of electricity.	Two series of compounds, cuprous and cupric. Uses: for electrical appliances, sheathing of ships, boilers, electrotyping, coinage, in calico printing, dyeing, as an insecticide, and to make brass, bronze, gun metal, and copper sulphate or blue vitriol.	Copper compounds burn in a flame with a characteristically vivid blue or green color.
ERBIUM Symbol Er. At. wt. 167.64. Sp. gr. 4.77. Discovered by Mosander, 1843.	A rare earth element, associated with ytterbium, holmium, and thulium. Found in gadolinite, euxenite, and similar forms.	Erbium is similar to the earthy elements with which it is found.	Erbium forms a series of rose-colored salts that give an acid reaction with litmus.	Solutions of the salts show strong absorption spectrum.
FLUORIN Symbol F. At. wt. 19. Valence I. Sp. gr. .0017. Discovered by Scheele, 1771.	Occurs in fluorite, cryolite, and many other minerals; in water, stems of grass, bones, and other animal substances.	A light, greenish-yellow gas; penetrating and disagreeable odor, irritating the eyes and mucous membrane.	Hydrofluoric acid is used for glass etching. Certain compounds of fluorin form valuable antiseptics, and are also used for preserving food.	Fluorin unites directly with almost all elements; it decomposes water, and almost all compounds, except those with oxygen.
GADOLINIUM Symbol Gd. At. wt. 157.3. Valence III. Discovered by Marignac, 1886.	A rare element occurring in the mineral gadolinite with ytterbium, erbium, and other rare earths.	Best separated from other elements by crystallizing the double magnesium nitrates. Appears as white oxid and colorless salts.	Its chief compound is the oxid.	Least soluble of rare-earth series. Absorption bands are in the ultra violet.
GALLIUM Symbol Ga. At. wt. 69.72. Valence II. or III. Sp. gr. 5.9. Discovered by Boisbaudran, 1875.	Found in minute quantities in zinc ores. Discovered by use of the spectroscope.	A fairly hard, gray metal. Melts at 29.7° C. The only metallic element, besides mercury, which can be liquid at ordinary temperatures.	It combines with oxygen, forming a monoxid and a sesquioxid, and with chlorin to form a dichlorid and a trichlorid.	Dissolves readily in hydrochloric acid or caustic soda solution. Because it boils at 1700° C, gallium has been suggested for thermometers for high temperatures.
GERMANIUM Symbol Ge. At. wt. 72.60. Valence IV. Sp. gr. 5.47. Discovered by Winkler, 1886.	Rare metal, allied to tin and lead, first found in Saxony. Now obtained largely from American zinc ores. Its oxid reduced by aluminium, carbon, or hydrogen.	Grayish-white, crystalline metal, so brittle it cannot be drilled, and melting at 958.5° C.	It combines with oxygen to form a germanic oxid and a germanious oxid, and with other elements to form a series of salts.	Insoluble in HCl; easily soluble in aqua regia.
GOLD Symbol Au. (*Aurum*) At. wt. 197.2. Valence I. or III. Sp. gr. 19.3. Prehistoric.	Occurs native and free in placer mines, and mixed with quartz.	A yellow, very heavy, the most malleable and ductile metal; very soft. Melts at 1064°.	The chlorid of gold used in photography; the metal used for coinage and jewelry.	Easily soluble in aqua regia, formed by mixing nitric and hydrochloric acids. Practical test, nitric acid, which has no effect upon gold.

Name of Element.	Mode of Preparation.	Properties.	Chief Compounds and Uses.	Tests and Characteristics.
HAFNIUM Symbol Hf. At. wt. 178.6. Valence 0. Sp. gr. 13.3. Discovered by Coster, Hevesy, 1923.	Metallic element, No. 72, always associated with zirconium. Separated with difficulty from salts of zirconium. Discovery and name, *celtium*, claimed by G. Urbain.	One of the rare earth elements. Has same crystalline structure as zirconium. Has high melting point and electronic emissivity.	Used in lamp filaments and in some radio tubes.	Arc spectrum seen by G. Urbain in 1911. Moseley analysis by X-ray known before 1915.
HELIUM Symbol He. At. wt. 4.002. Sp. gr. 0.5. Discovered by Ramsay, 1895.	Discovered in sun by Lockyer, 1868. An inert or noble gas, allied to argon group.	Lightest of gases next to hydrogen. Found in air, many minerals, and in natural gas.	Does not combine with other elements, but found with argon, krypton, and others in air.	
HYDROGEN Symbol H. At. wt. 1.0078. Valence I. Sp. gr. 0.087. Discovered by Cavendish in 1766.	1. Electrolysis of water. 2. Decomposition of water by (*a*) Sodium, $Na + H_2O = NaOH + H$. (*b*) Potassium, $K + H_2O = KOH + H$. 3. Action of sulphuric acid on zinc, $H_2SO_4 + Zn = ZnSO_4 + H_2$.	Colorless, odorless, and tasteless; lightest element known; is combustible; combines with oxygen to form water. Boiling point −252.5°; freezes at −257°.	Water (H_2O), hydrogen peroxid (H_2O_2), illuminating gas, and nearly all the organic compounds. Uses: Oxyhydrogen blowpipe, light, and blast flame. A constituent of all acids.	Burns with a pale flame; does not support life or combustion; lighter than all other gases; distinguished by absence of color and odor.
INDIUM Symbol In. At. wt. 114.76. Val. I. and III. Sp. gr. 7.25. Discovered by Reich and Richter, 1863.	Occurs in zinc blende. Best obtained from commercial metallic zinc by use of mild hydrochloric acid.	Metallic indium is ductile, silver-white, and lustrous. Its melting point is at 155° C.	With oxygen indium forms two compounds, a monoxid (InO), and a sesquioxid (In_2O_3). Other oxids are said to exist.	Indium is not acted upon by air or boiling water, but burns to its sesquioxid, when heated in air, with a blue-violet flame.
IODIN Symbol I. At. wt. 126.932. Sp. gr. 4.94. Valence I. or II. Discovered by Courtois, 1811.	Occurs in sea weeds and sea water. From the ashes of sea weeds and from sodium nitrate, commercial iodin is obtained.	A lustrous, grayish-black, soft crystalline solid. Volatilizes into a blue-violet gas, with an irritating odor. Dissolves freely in alcohol, chloroform, and ether.	Forms a class of compounds known as iodids. Used in the arts and in medicine.	Gives a deep blue color to starch paste. Stains the skin yellow.
IRIDIUM Symbol Ir. At. wt. 193.1. Val. II. or IV. Sp. gr. 22.4. Discovered by Tennant, 1804.	Occurs in alluvial deposits, along with platinum, and is separated from it and other similar metals by chemical processes.	A very hard, white, brittle, lustrous metal, extremely infusible.	Iridium alloys with other platinum metals and gold, copper, and lead. Used in making standard weights, balances, tips of pens, and for coating surgical instruments.	Iridium is insoluble in several mineral acids, and also in aqua regia.
IRON Symbol Fe. (*Ferrum*) At. wt. 55.84. Valence II. or III. Sp. gr. 7.86. Prehistoric.	Alloyed with a small percentage of nickel. It occurs in ores known as brown or red hematite and limonite. When endowed with magnetic properties the ore is known as magnetite. Sulphid of iron or iron pyrites (fool's gold) is iron ore containing sulphur.	Silver-white; crystallizes in the isometric system; fuses at from 1400° to 1500° C. Very tenacious, ductile, magnetic, malleable, and can be tempered. Iron is soluble in acids. Dry air or oxygen does not act upon it, but moisture causes rust, which can be prevented by a coating of paint or varnish, or of such metals as zinc, tin, nickel, copper, or lead.	Pig or cast iron, wrought or puddled iron, and steel; produced by blast furnace, puddling, crucible, Bessemer, and open hearth process. Ferric oxid, as a paint and polishing powder; magnetic oxid, to protect iron in the Bower-Barff process. Ferrous sulphid, for preparing hydrogen sulphid gas; ferrous sulphate, in dyeing, tanning, ink; both ferrous and ferric salts in medicine; ferric hydroxid—a useful antidote for poisoning by arsenious oxid; cast iron, as foundation work; wrought iron, used where it has to undergo strain, and for electro-magnetic purposes.	
KRYPTON Symbol Kr. At. wt. 83.7. Monatomic. Sp. gr. 0.0037. Discovered by Ramsay and Travers, 1898.	Rare gas making up one-millionth part of the air. Found first in liquid air.	It boils at −151.7° C. and melts at −169° C. Colorless and odorless.	Belongs between bromine and rubidium in the periodic table. Found with argon, neon, and xenon.	Its spectrum has bright yellow line with greener tint than helium, also a brilliant green line.
LANTHANUM Symbol La. At. wt. 138.92. Valence III. Sp. gr. 6.15. Discovered by Mosander, 1839.	Occurs in such rare minerals as cerite, orthite, monazite, gadolinite.	A white, fairly malleable and ductile metal. Harder than cerium.	Forms one oxid (La_2O_3), and colorless salts, though another is said to exist.	Lanthanum burns brilliantly when heated in air. Easily attacked by cold. Oxidizes rapidly in dry air.

Name of Element.	Mode of Preparation.	Properties.	Chief Compounds and Uses.	Tests and Characteristics.
LEAD Symbol Pb. (*Plumbum*) At. wt. 207.22. Valence II. and IV. Sp. gr. 11.34. Prehistoric.	Found native in small quantities, usually with a little silver or antimony. Extracted from its ores and metallurgical products by roasting and reaction, roasting and reduction, and precipitation. Commercial lead is almost all obtained from galena.	A bluish-gray, lustrous metal, exceedingly malleable and ductile, very soft, and with but little tenacity. It leaves a black streak on white paper, and is an inferior conductor of electricity and heat. Lead is somewhat soluble in water. Pure dry air does not affect it, but air and moisture cause it to become coated with oxid. Resists acids.	Compounds of lead with oxygen are litharge and minium; the former is used in making flint glass, as a glaze for earthenware, in the preparation of lead salts, as a paint, and for drying oils; the latter is used in the arts as a pigment, in the manufacture of flint glass, as a cement for making steam-tight joints, and in making secondary batteries. White lead is used as a pigment, and as a body for colors in making paint. Lead acetate is used in medicine, in the arts, in refining sugar. Lead sulphate is a substitute for white lead. The lead chromates are used in calico printing. Lead is also used in making shot. Lead compounds are all poisonous. There are five different oxids of lead.	
LITHIUM Symbol Li. At. wt. 6.940. Valence I. Sp. gr. 0.534. Discovered by Arfvedson, 1817.	Occures in small quantities in rare minerals, also mineral water, and leaves of certain plants, especially of tobacco and beets.	A soft, white metal, the lightest solid known. Floats upon water.	Oxid, carbonate, citrate, and salicylate are its compounds.	Lithium imparts a red coloration to an otherwise colorless flame.
MAGNESIUM Symbol Mg. At. wt. 24.32. Valence II. Sp. gr. 1.74. Discovered by Liebig and Bussy, 1830.	Widely distributed in nature. Occurs in magnesite, dolomite, epsom salts, and kieserite. Prepared by electrolysis from carnallite.	A very lustrous, light, silver-white, ductile, malleable, moderately hard, rather tough metal.	Magnesia and the several carbonates, citrate of magnesia, magnesium chlorid, asbestos, soapstone, and meerschaum are the chief compounds. Used in flashlight powder, fireworks, and medicines.	Burns with an intense white light.
MANGANESE Symbol Mn. At. wt. 24.93. Valence II, III, VII. Sp. gr. 7.3. Discovered by Gahn, 1774.	Occurs in ores, chief of which is pyrolusite, mineral waters, and in many plants. Prepared by reduction in a blast furnace; by carbon in an electric furnace; or by thermite process, as with chromium.	A very hard, grayish-white, brittle metal with a reddish luster. Takes a high polish and is not malleable. Melts at about 1260° C. Rusts in moist air.	Forms several oxids, used in making chlorin, black enamel for pottery, glass, and in the preparation of oxygen; chlorid used in calico printing; the pure form used in steel and alloys.	Manganates are green and remain stable only under alkaline combinations; permanganates are purple, and remain stable under neutral or under acid conditions.
MERCURY Symbol Hg. (*Hydrargyrum*) At. wt. 200.61. Valence I. or II. Sp. gr. 13.60. 300 B. C. Prehistoric.	Mercury occurs chiefly in cinnabar (mercuric sulfid). Its crystals are dark red. Produced in the United States, Spain, and Austria by roasting in air, when the surfur is driven off, and mercury is condensed to liquid metal.	A heavy, silver-gray or nearly white, very lustrous, cohesive, mobile liquid. Freezes at −40°. Dissolves most metals. An amalgam is an alloy of mercury and some other metal. Sodium amalgam is a reducing agent, notably for gold and silver ores.	Red oxid of mercury, mercuric chlorid or corrosive sublimate, one of the best antiseptics known, and mercurous chlorid or calomel, are the chief compounds. Mercury is used in barometers and thermometers.	Mercury is a cumulative poison in the human system. Mercury salts injure lead plumbing. Mt. Wilson telescope is balanced in mercury receptacle and so turns easily.
MOLYBDENUM Symbol Mo. At. wt. 96.0. Valence IV, VI. Sp. gr. 10.2. Discovered by Hjelm, 1790.	Found chiefly in molybdenite, but for centuries confused with graphite. Reduced by nitric acid to sulfuric acid and white solid, known as molybdic acid.	A very hard, silver-white metal, with a melting point above that of platinum.	Now used instead of tungsten in high-speed steels; in various alloys for hardness and durability, notably with chromium; and for filiments, grids, and screens in radio equipment.	Not much affected by ordinary air or acids, save by nitric, which rapidly reacts with the metal.
NEODYMIUM Symbol Nd. At. wt. 144.27. Valence III. Sp. gr. 7.00. Discovered by Welsbach, 1885	Prepared by fractional crystallization from the double magnesium nitrate. Occurs with cerium, lanthanum, and others, in monazite, cerite, and other minerals.	Light blue powder, often with brown tint. Slowly oxidizes in air; gradually attacked by water. Melts at 840° C.	Oxid is dissolved by HCL and HNO_3, giving amethyst solutions of intense absorption spectra.	Fractionation by Welsbach of didymium gave two earths, praseodymium and neodymium. See rare earths at end of tables.
NEON Symbol Ne. At. wt. 20.183. Sp. gr. —— Discovered by Ramsay and Travers, 1898.	Present in the atmosphere to the extent of one or two parts per 100,000.	With argon, helium, krytpon, and xenon, one of the inert gases.	Used in advertising signs, by passing an electric current through rarified neon. In mercury vapor lamps turns the greenish hue of mercury to white.	Neon glows red-orange in a vacuum tube, and is marked by strong red and green lines in its spectrum.
NICKEL Symbol Ni. At. wt. 58.69. Val. II, IV. Sp. gr. 8.8. Disc. by Cronstedt, 1751.	Occurs free in meteorites and in niccolite and nickel glance. It is manufactured chiefly from garnierite. Extracted from the ores by smelting and electrolysis.	A silver-white, lustrous metal that is magnetic, ductile, hard, tenacious, and capable of taking a fine polish. Its melting point is about 1455° C.	Nickel forms nickelous and nickelic oxids and hydroxids: used in making alloys, currency, nickel-plating. The carbonate is used in electroplating.	Rusts very slowly in moist air.

Name of Element.	Mode of Preparation.	Properties.	Chief Compounds and Uses.	Tests and Characteristics.
NITROGEN Symbol N. At. wt. 14.008. Valence III. and V. Sp. gr. of gas 0.95; liquid 0.80. Discovered by Rutherford in 1772.	Four fifths of the atmosphere. Prepared by burning the oxygen out of the air with phosphorus, which forms phosphorus pentoxid (P_2O_5) and dissolves in water; by passing nitrous oxid over heated copper, $N_2O + Cu = CuO + N_2$; by action of chlorin upon ammonia.	Odorless, colorless, tasteless, not combustible nor a supporter of combustion. Animals in an atmosphere of N die for want of oxygen. One of the most inert of the elements, except in the nascent state. Liquefies by pressure at −146°; boils at −194°.	Carbon dioxid (CO_2). Ammonia gas (NH_3). Ammonia liquor (NH_4OH). Nitric acid (HNO_3), and the nitrates. Important in the manufacture of explosives, antipyrine, and dyes.	Differs from O by not supporting life or combustion; from chlorin by its absence of color or odor; from hydrogen by its weight and its incombustibility; from CO_2 by its weight.
OSMIUM Symbol Os. At. wt. 191. Valence VI, VIII. Sp. gr. 22.48. Discovered by Tennant, 1804.	Obtained chiefly from mineral osmiridium, by treatment with zinc and hydrochloric acid. Occurs with platinum and iridium.	A lustrous, bluish-white, hard, crystalline metal, extremely infusible.	Osmium is used to make the filaments of incandescent electric lamps, as an alloy for machinery bearings, and as tips of gold pens. Osmic acid is used in microscopy.	Its compounds with oxygen form four oxids. When ignited, insoluble in all acids.
OXYGEN Symbol O. At. wt. 16. Valence II. Sp. gr. 1.105. Discovered by Priestley in 1774.	1. Mercuric oxid (HgO) heated in a tube gives metallic mercury and oxygen. HgO + heat = Hg + O. 2. Potassium chlorate ($KClO_3$) heated in the presence of black oxid of manganese, gives oxygen. $2KClO_3 + MnO_2 = 2KCl + MnO_2 + 3O_2$.	Colorless, tasteless, odorless, soluble in water sparingly. Unites with many substances, forming oxids. Supports combustion. Ozone (O_3) is an allotropic form,—a colorless or bluish unstable gas with a strong odor. Boils at −182.7° C.; freezes at −219° C.	Most abundant element in nature. Found in air, water, and all oxids, etc. Uses: Indispensable to human and animal life, and to the support of flame. Used in medicine, for collapse and heart failure.	A glowing splinter or an ignited sulphur-tipped watch spring will burn in it. Differs from other supporters of combustion in the violence with which bodies burn in it. Does not burn itself. Absence of color and odor distinguishes from some other gases.
PALLADIUM Symbol Pd. At. wt. 106.7. Val. I., II., IV. Sp. gr. 11.5. Disc. by Wollaston, 1803.	Found in grains usually containing platinum and iridium, gold and silver, also gold and lead.	A grayish-white, lustrous metal, fairly malleable and very ductile.	Used for making scales and division marks on scientific instruments, for coating and preserving silvered wire; used in dentistry.	Combined with oxygen, forms four oxids. Noted chiefly for its great tendency to absorb hydrogen.
PHOSPHORUS Symbol P. At. wt. 31.02. Val. III. and V. Sp. gr. 1.9–2.7. Discovered by Brand, 1674.	Found in nature in the form of phosphates. Prepared from bones by distillation. Occurs in allotropic forms as red, yellow, or ordinary, and crystalline phosphorus.	Yellow form, a waxy solid; combustible on exposure to the air; kept under water; is cut with ease; faint odor of garlic. Red form, dull, odorless, tasteless powder.	It forms three hydrids and three oxids. Red phosphorus used for friction matches, in phosphates (for fertilizers), in rat poisons, and for phosphor-bronze.	Distinguished from sodium and potassium by odor, color, combustibility, and behavior in water. Odor is distinctive. Red form burns with slight friction.
PLATINUM Symbol Pt. At. wt. 195.23. Valence II. or IV. Sp. gr. 21.4. Discovered by Wood, 1741.	Most abundant of the six metals of palladium-platinum group. Found in river sands, and in Urals, Colombia, United States, and Canada. Purified by aqua regia.	A very heavy, grayish-white, malleable, ductile and tenacious metal, which melts at 1773.5° C. Expands almost equally with glass. Does not rust. Fair electric conductor, but resists some metals.	Metallic platinum is used in dentistry; in contact points of spark coils; in jewelry; as a catalytic agent in chemistry; and in laboratory apparatus.	Has high melting point; resists acids and water solutions of salts and alkalies. For laboratory dishes, a palladium gold alloy is being substituted.
POTASSIUM Symbol K. (*Kalium*) At. wt. 39.096. Valence I. Sp. gr. 0.86. Discovered by Davy, 1807.	Occurs in many silicates in the mines of Strassfurt, Prussian Saxony. 1. Electrolysis of solution of potassium hydroxid (KOH). 2. Leaching hard-wood ashes.	White, brittle, solid, decomposes water as sodium does. Burns with a lilac color when thrown on water. Melts at 62.5°; boils at 712° C.	Has many compounds. Potassium hydroxid (KOH) for washing or as lye, and in soap making. Potassium carbonate and potassium nitrate or saltpeter, potassium chlorite ($KClO_3$), used in medicine.	Burns with a violet or lilac flame in flame test. Potassium salts usually impart violet color to Bunsen flame.
PRASEODYMIUM Symbol Pr. At. wt. 140.92. Valence III. Sp. gr. 6.6. Disc. by Welsbach, 1885.	Found with cerium, lanthanum, and neodymium in monazite, cerite, and allanite. Separated by fractional distillation.	Combined with neodymium, was once called didymium.	Its oxid is nearly black powder, varying in composition, but soluable in acids.	Oxids in acids give green color and strong absorption spectrum.
RADIUM Symbol Ra. At. wt. 226.05. Sp. gr. 5.000. Disc. by M. and Mme. Curie, 1898, 1910. Pure radium disc. by Mme. Curie, 1910.	Heaviest of alkaline-earth metals; in group with barium, strontium, and calcium. Found in pichblende, carnotite, and autuntite. Refined in five steps. Associated with uranium and actinium forms.	A substance three million times as active as uranium. It maintains its own temperature, 1.5° C., above its surroundings, and emits heat radiations in enormous quantities without combustion, chemical change, or decrease in energy.	Usually marketed with salts of barium. In 1935 worth $50,000 a gram. Used effectively in cancer, but uncontrolled makes dangerous burns. Traces of radium salts used in paint for luminosity.	Unique in radioactivity, or throwing off heat emanations and light. Increase in amount increases strength of emanations. Not affected by temperature. Three types of rays. Over 40 types of radioactive matter.

Name of Element.	Mode of Preparation.	Properties.	Chief Compounds and Uses.	Tests and Characteristics.
RHODIUM Symbol Rh. At. wt. 102.91. Valence III. Sp. gr. 12.3. Disc. by Wollaston, 1803.	Found in small amounts in platinum ores, with osmium, iridium, and ruthenium. Platinum is removed by precipitation with ammonium chloride, and others removed by converting the precipitate remaining into potassium rhodium sulfate.	Rhodium is slightly bluish, fuses at about 1940°C., oxidizes if heated in air, and has compounds with ammonia. Found in common table salt in minute quantities.	It combines with oxygen and forms about four oxids. Its salts form red solutions. An alloy with platinum is used in some forms of pyrometers, and its alloy with steel is also valuable.	Insoluble in acids or aqua regia, except by hot sulfuric acid or on fusion with potassium bisulfate, —a peculiar quality of platinum metals.
RUBIDIUM Symbol Rb. At. wt. 85.44. Valence I. Sp. gr. 15.2. Discovered by Bunsen, 1861.	Found with cæsium in lepidolite and petalite, in water from various springs, in ashes of seaweed and tobacco, in tea, and beet-root. Prepared by electrolysis.	A silver-white, soft metal that melts at 38.5° C., and evolves a bluish vapor at a dull, red heat. The most positive element next to cæsium.	With oxygen rubidium forms a monoxid similar to that of potassium. No oxid has been isolated.	Rubidium oxidizes rapidly in air, and decomposes water. Gives red color when heated in a non-luminous flame.
RUTHENIUM Symbol Ru. At. wt. 101.7. Val. VI, VIII. Sp. gr. 12.28. Discovered by Claus, 1845.	Occurs in its metallic state in platinum ores and in osmiridium, also as the sulphid in laurite.	A white, lustrous, hard, heavy, brittle metal that melts at about 2450° C; very infusible.	It forms several chlorids and oxids, which, in turn, form various salts, of no importance commercially.	Dissolves slowly in aqua regia, but insoluble in other acids.
SAMARIUM Symbol Sm. At. wt. 150.43. Valence III. Sp. gr. 7.7. Disc. by Boisbaudran,1879.	In many minerals like monazite, gadolinite, and samarskite. Separated from other minerals of the earth group by fractional crystallization of double magnesium nitrates from 50% of nitric acid.	The metal is prepared by electrolysis of chloride.	Its compounds are oxid, a very faint yellow powder, and chlorid, topaz-colored deliquescent crystals.	Samarium is characterized by its spark spectrum, and by the absorption spectra of its salt solutions.
SCANDIUM Symbol Sc. At. wt. 45.10. Valence III. Sp. gr. 2.5. Disc. by Nilson, Cleve, 1879.	Its oxid is found combined with minerals like thortveitite, wiikite, gadolinite, and tin ores. Relatively abundant in the sun and stars.	The element has not been isolated.	Forms colorless salts, derived from an oxid.	Spectrum (spark) is characteristic and very complex.
SELENIUM Symbol Se. At. wt. 78.96. Val. II. or VI. Sp. gr. 4.6 (c). Disc. by Berzelius, 1817.	Occurs with copper, lead, silver, sulphids, and several rare minerals, as well as in the lavas of Vesuvius.	It is of a dark brown or gray color by reflected light, but red in thin pieces by transmitted light. Selenium is both odorless and tasteless.	The crystalline variety of the element conducts electricity, upon which property the photophone was based. Its compounds are similar to those of sulphur.	Selenium burns with a reddish-blue flame that has an odor resembling horseradish.
SILICON Symbol Si. At. wt. 28.06. Valence IV. Sp. gr. 2.33. Discovered by Berzelius, 1823.	As silica or oxid of silicon, occurs in nature as quartz, rock crystal, amethyst, flint, agate, jasper, opal, sand, and many other earthy forms.	Exists in two forms: 1. Dark brown powder, melting with difficulty, known chiefly through its compounds. 2. Very lustrous, gray, metal-like leaflets.	A compound containing silicon and sodium is known as soluble or water glass. Used as a coating for stone, making artificial stone, glass, soap, fireproofing, and for preserving eggs.	1. Burns when heated in air: insoluble in water. 2. Does not change when heated.
SILVER Symbol Ag. (*Argentum*) At. wt. 107.880. Valence I. Sp. gr. 10.50. Prehistoric.	Occurs as argentite, stephanite, ruby silver ore and silver chlorid, or horn silver. Also mixed with lead or copper ore.	A pure white metal with brilliant luster. Harder than gold. Very malleable and ductile. Best conductor of heat and electricity.	Silver nitrate, used in medicine, photography, electroplating, and silvering mirrors. Alloyed with copper to make it harder. Used for coins and ornaments.	By blowpipe analysis, reduction, and extraction of the metal.
SODIUM Symbol Na. (*Natrium*) At. wt. 22.997. Valence I. Sp. gr. 0.97. Discovered by Davy, 1807.	Electrolysis of solution of moist sodium hydroxid (NaOH); by reducing sodium carbonate with coal and chalk; by reducing sodium hydroxid with an iron carbid,—Castner process. Sodium chlorid forms two thirds of solid matter in sea water and the great salt deposits.	Light, malleable, ductile, silver-gray, lustrous, soft metal; decomposes water by setting free one atom of H, and forming sodium hydroxid (NaOH), with the hydroxyl radical. Melts at 97.5°; boils at 750°.	Sodium hydroxid, washing soda, or soda lye, used in soap making. Sodium chlorid, or common salt (NaCl); sodium carbonate and bicarbonate (baking soda); sodium nitrate (Chile saltpeter); borax, soluble glass, and hyposulphite of soda used in photography.	Burns with yellowish flame in flame test. All sodium salts color Bunsen flame yellow.
STRONTIUM Symbol Sr. At. wt. 87.63. Valence II. Sp. gr. 2.60. Discovered by Davy, 1808.	Found in celestine, strontianite, and other minerals, also in mineral and sea waters and ashes of certain plants.	A yellow metal, which melts at a moderate red heat, malleable and ductile, and is less electropositive than calcium and the alkali metals.	Strontium combines with oxygen to form a monoxid and a dioxid. Used to separate sugar from beet-root molasses and in pyrotechny.	Strontium oxidizes quickly in air, and burns brilliantly when heated. It acts on water, setting hydrogen free. Its salts color Bunsen flame red.

Name of Element.	Mode of Preparation.	Properties.	Chief Compounds and Uses.	Tests and Characteristics.
SULPHUR Symbol S. At. wt. 32.06. Valence II., IV. or VI. Sp. gr. 1.96–2.07 Prehistoric.	Occurs native near volcanoes, and mixed with ores as sulphids. Takes on several forms according to temperature rhombic, prismatic, and amorphous. Sicily yields 500,000 tons of sulphur a year.	Brittle, yellow, lustrous, hard. Unites readily with oxygen, and directly with copper, zinc, and iron to form sulphids. Melts at 114°, boils at 444°.	Sulphur in matches, gunpowder, and vulcanizing. Hydrogen sulphid (H_2S) a gas used in laboratory testing of minerals and metals. Sulphur dioxid (SO_2), disinfectant, bleaching, and making sulphuric acid, which is of wide industrial use.	Burns with bluish, pale, lambent flame; giving off suffocating odor. Its gas does not burn or support combustion.
TANTALUM Symbol Ta. At. wt. 180.88. Valence V. Sp. gr. 16.6. Discovered by Eckeberg, 1802.	Occurs with columbium in columbate, tantalite, Fergusonite, and other minerals. Refined by fusion with potassium fluoride, sodium peroxide, or potassium bisulphate in three processes.	A rare metal resembling platinum, when pure, malleable and very ductile, when impure it is a black powder that assumes an iron-gray metallic luster under a burnisher.	Tantalum wire now replaced by tunsten in electric filiments. Used to replace platinum in weights; for steel in surgical instruments; for rectifiers and chemical containers.	Its salts are called tantalates. When heated in air begins to oxidize turning yellow.
TELLURIUM Symbol Te. At. wt. 127.61. Val. II. or VI. Sp. gr. 6.25. Discovered by Reichenstein, 1782.	Occurs free, and as graphic tellurium, as nagyagite, as silver tellurid, and as bismuth tellurid, also in gold and copper ores.	A white, shining, crystalline, brittle solid, which melts at about 452° C., resembles selenium. It is a black powder when formed by precipitation.	Tellurium combines with oxygen to form three oxids, two of which unite with water to form acids, which in turn yield a series of salts.	Burns to the dioxid with a blue flame, when heated in air.
TERBIUM Symbol Tb. At. wt. 159.2. Valence III. Discovered by Mosander, 1843.	Very rare metal of rare-earth group, separated from the rest by fractional crystallization of the bromates.	Mosander showed that yttria contains ceria, lanthana, didymia, a colorless oxid, still called yttria, a yellow, erbia, and a rose-colored one, terbia, all six elements later isolated.	G. Urbain made first pure compounds in 1905. There are bromates, oxalates, and sulfates of terbium.	Burning terbium oxalate or sulfate gives black peroxid. The absorption band is in the blue of the spectrum.
THALLIUM Symbol Tl. At. wt. 204.39. Val. I. or III. Sp. gr. 11.85. Discovered by Crookes, 1861.	Occurs with copper and silver, in crookesite, in pyrites, in the seleniferous deposits from sulphuric acid, in other minerals, and in mineral waters. Prepared from flue-dust of works in which sulphuric acid is made.	Metallic thallium is bluish white, lacking tenacity and elasticity. It melts at about 302° C., and boils at 1300°. Readily oxidized, soluble in nitric and other acids; does not combine with hydrogen, but directly with the halogens.	It combines with oxygen to form a monoxid and trioxid, which yield a series of salts known as the thallous and thallic compounds. Its compounds are very poisonous, in effect resembling lead poisoning.	Thallium tarnishes rapidly when exposed to the air, becoming coated with oxid, which preserves the rest of the metal. Thallium may be detected by the green line in its flame spectrum.
THORIUM Symbol Th. At. wt. 232.12. Valence IV. Sp. gr. 11.85. Discovered by Berzelius, 1828.	Though found in several rare minerals, thorium is produced commercially only from monazite sand. Thorium is strongly radioactive, forming the parent of at least 10 other substances.	A grayish-white powder which assumes an iron-gray luster when burnished; somewhat brittle, infusible, insoluble in water.	Thorium compounds are used in making crucibles; the nitrates (with 1% of ceria) for incandescent gas mantles; salts of the organic acids in skin diseases; and thorium emanation (thoron) for inhaling for lung diseases.	Thorium takes fire when heated in air, burning with a bright flame.
TIN Symbol Sn. (*Stannum*) At. wt. 118.70. Valence II. or IV. Sp. gr. 7.28. Prehistoric.	Found in nature chiefly as the mineral cassiterite or "tinstone" (SnO_2). Ore is washed, roasted, and smelted. The reduced metallic tin is tapped off and melted from impurities.	A silver-white, malleable, ductile metal, of low tenacity, and highly crystalline. Melts at 232° C., boils at 2270° C. Poor conductor of electricity. Takes a high polish. Tin is little acted on by air. Heated in air, it rapidly oxidizes, forming tin dioxid, used for polishing.	Used to coat other metals to prevent rusting or corroding, as a lining for copper vessels and lead pipes to prevent these poisonous metals from contaminating food and water. Tin dioxid forms stannates with basic oxids, sodium stannate being used in calico printing. Stannous chlorid is used as a mordant. Tin is used in the manufacture of tin plate, tin foil, alloys, bell metal, bronze, gun metal, pewter, type metal, etc. Stannic sulphid, known as "mosaic gold," was formerly used for gilding, imitating bronze, etc.	
TITANIUM Symbol Ti. At. wt. 47.90. Val. IV. Sp. gr. 4.5. Discovered by Gregor, 1789.	Though widely distributed in the earth, this element can be extracted commercially from only a few substances like rutile, ilmenite, magnetite, and perovokite.	A dark gray amorphous powder resembling reduced iron. It is distinguished from almost all other metals for its capacity of uniting with nitrogen at a high temperature.	Titanium gives hardness and toughness to steel and a fine luster to silver, and also increases the brilliancy of arc lamps. Its compounds with oxygen are dioxid, trioxid, and sesquioxid.	Burns with an intense light when heated to redness in the air. Decomposes boiling water, and is soluble in dilute acids.
TUNGSTEN Symbol W. At. wt. 184.0. Val. VI. Sp. gr. 19.1. Disc. by d'Elhujar, 1783.	Occurs in wolfram or tungstate of iron, and in scheelite or calcium tungstate.	A bright, steel-gray, hard, brittle, crystalline substance, difficult of fusibility; high unknown melting point.	Used in filiments for electric lamps, as alloy with steel, X-ray targets, electrical contacts, and crucibles.	Oxidized in air only at red heat; slowly attacked by water containing carbonic acid.

Name of Element.	Mode of Preparation.	Properties.	Chief Compounds and Uses.	Tests and Characteristics.
URANIUM Symbol U. At. wt. 238.14. Valence IV, VI. Sp. gr. 18.7. Discovered by Klaproth, 1789.	From rare minerals, mainly pitchblende (uranitite) and carnotite. In 1841, isolated by Peligot; found radio active by Becquerel, 1896. Parent of other forms.	A hard, silvery-white, somewhat malleable metal which melts near white heat, or a grayish-black powder. It has the highest atomic weight of all the elements.	It produces uranic salts. Uranic oxid also acts as an acid, forming uranates of the alkali metals. The compounds are used in china painting, and as photographic reagents.	Known for changes in valency and for instability. Dissolves in acids yielding green-yellow solutions. The solid salts, when shaken or crushed, emit light.
VANADIUM Symbol V. At. wt. 50.95. Valence III, V. Sp. gr. 5.7. Disc. by Berzelius, 1831.	Found in several minerals, mainly in patronite, carnotite, and rosceolite. Extracted by use of acid and by fusing patronite with sodium carbonate and treating with water.	A light gray, crystalline, lustrous powder, very infusible; not magnetic.	Forms an alloy with platinum, produces five oxids, besides several chlorids. Used to harden steel, in dyeing, and in making ink.	Powder burns in Bunsen flame; does not oxidize in air at ordinary temperature.
XENON Symbol Xe. At. wt. 131.3. Sp. gr. 4.094. Discovered by Ramsay and Travers, 1898.	A gas found in the atmosphere, in quantities of one part in 20,000,000 parts of air. Its boiling point is —109.18 C., and its melting point, —140° C.	The heaviest and rarest of the elementary gases of the argon family. It is colorless.	It has no reactions and is monatomic.	Xenon when sparked in a vacuum tube is marked by a characteristic blue glow, which changes to green on the introduction of a Leyden jar, and shows distinctive spectrum lines.
YTTERBIUM Symbol Yb. At. wt. 173.04. Valence III. Discovered by Marignac, 1878.	G. Urbain, 1907, separated ytterbium from lutecium. It is difficult to distinguish the special characteristics of each.		It forms with oxygen (Yb_2O_3), and a sulphate, ($Yb_2(SO_4)_3 \cdot 8H_2O$).	Ytterbium has a higher magnetic susceptibility then lutecium, and its own spectrum.
YTTRIUM Symbol Yt. At. wt. 88.92. Valence III. Sp. gr. 4.57. Discovered by Wöhler, 1828.	Rare-earth element, associated with cerium, lanthanum, ytterbium, erbium, and terbium. With last three, from town of Ytterby, Sweden, where first located in minerals like gadolinite.	A dark gray powder that assumes the luster and color of metallic iron when burnished.	It forms a sesquioxid, which is a yellowish-white powder. It is said to be used in the Nernst incandescent electric lamp.	The oxid glows strongly when heated. The metal has a characteristic spark spectrum.
ZINC Symbol Zn. At. wt. 65.38. Valence II. Sp. gr. 7.14. Discovered by Paracelsus, 1520.	Occurs in ores; sphalerite, smithsonite or calamine, willemite, zincite, and franklinite. Principally obtained from zinc oxid.	A bluish-white crystalline, brittle, lustrous metal.	In sheets used for roofing, mixed with copper to form brass, for coating or galvanizing; zinc sulphate, or white vitriol, in medicine; zinc chlorid, an antiseptic, a caustic, and an irritant poison.	When strongly heated in air it burns with a bluish-white flame, giving zinc oxide.
ZIRCONIUM Symbol Zr. At. wt. 91.22. Valence IV. Sp. gr. 6.53. Discovered by Berzelius, 1825.	Occurs in combination with silica in the mineral zircon, and also in certain rarer minerals, including eudialyte, fergusonite, and polymignite.	A black amorphous powder which has also been obtained as a lustrous, gray, brittle, crystallized solid. Its melting point is above 1300° C.	Used as a cleansing agent in metallurgy; once in gas mantles, but now superseded by thoria and ceria; and with carbon as zirconium carbide for cutting glass.	Only oxidized at a very high temperature.

Latest discoveries, not yet fully described, are **masurium** and **rhenium**, of the manganese group, by Noddack and Tacke, 1925; **alabamine** and **virginium** by Allison, 1930; and **illinium** by Hopkins, 1925. The table of 93 elements is now complete, but some are yet to be more fully studied.

Rare Earths, 16 in number, fall into three groups, but several appear together in mineral monazite, cerite, and the like. Very similar to those described above are **dysprosium**, found by Boisbaudran, 1907; **europium**, by Demarcay, 1903; **holmium**, by Boisbaudran, 1886; **illinium**, mentioned above; **lutecium**, by Welsbach and Urbain, 1907; and **thulium**, by Cleve, 1879. As yet little use is found for them.

Radio-active elements fall into three series—**uranium-radium** with 16 changes or forms; **thorium** with 12 changes; and **actinium** with 10. Some are established as elements, the certain ones being **polonium** and **radon**. **Radon** or **niton**, found by Mme. Curie in 1900, is the emanation of **radium**, an irert gas, which disintegrates half in 4 days. **Polonium** is more stable; also found by Mme. Curie before she discovered **radium**, but not known well until 1910. Its strength surpasses that of **radium** itself.

GEOLOGY.

Origin of the Earth.—It is to the astronomer that the geologist must look for the proofs of the origin of the earth. Among the exploded hypotheses that held their ground for long periods in old times the more important are the Ptolemaic and the Copernican systems.

The Ptolemaic System. Ptolemy of Alexandria (130-150) was the founder of a theory called the Ptolemaic system, based largely upon the materials gathered by such earlier astronomers as Hipparchus and Eratosthenes, who computed the size of the earth by means even now considered the best—the measurement of an arc of the meridian. The advocates of the Ptolemaic theory assumed that every planet revolves in a circle, and that the earth is the fixed center around which the sun and the heavenly bodies move. They conceived that a bar, or something equivalent, is connected at one end with the earth; that at some part of this bar the sun is attached; while between that and the earth, Venus is fastened, not to the bar directly, but to a sort of crank; and farther on, Mercury is joined on in the same way. They did not fully understand the nature of these bars—whether they were real or only imaginary—but they did comprehend their action, as they thought; and so they supposed the bar revolved, carrying the sun and planets along in a large circle about the earth; while all the short cranks kept flying around, thus sweeping each planet through a smaller circle. The movements of the planets were to the ancients extremely complex. Venus, for instance, was sometimes seen as "evening star" in the west; and then again as "morning star" in the east. Sometimes she seemed to be moving in the same direction as the sun, then, going apparently behind the sun, she appeared to pass on again in a course directly opposite. At one time she would recede from the sun more and more slowly and coyly, until she would appear to be entirely stationary; then she would retrace her steps, and seem to meet the sun. All these facts were attempted to be accounted for by an incongruous system of "cycles and epicycles." The system of Ptolemy passed current for 1400 years, and during this time astrology was ranked as one of the most important branches of knowledge. Star diviners were held in the greatest estimation, and the issue of any important undertaking, or the fortune of an individual, was foretold by means of horoscopes representing the position of the stars and planets. The system of the astrologers was very complicated, and contained regular rules to guide the interpretation, so intricate that years of study were required for their mastery. Venus foretold love; Mars, war; the Pleiades, storms at sea. Not only the ignorant were the dupes of this system, but the learned also accepted it,—Lord Bacon believing in it most firmly.

The Copernican System. This system represented the sun to be at rest in the center of the universe, and the earth and planets to move round it as a center. It got its name from Copernicus (1473-1543), who (although some vague general notion of the system seems to be due to Pythagoras) first distinctly drew the attention of philosophers to it, and devoted his life to its demonstration. For the rest, the glory of development on the lines he broadly laid down belongs to Kepler, Galileo, and others, particularly to Newton, who finally marked out the form of modern theoretical astronomy. The discoveries by Copernicus mark one of the greatest steps ever taken in science.

Modern Hypotheses.—Astronomers agree that the earth was in some way evolved from a nebula in some form.

Nebular Hypothesis. The Nebular Hypothesis assumes that the solar system was once an enormous mass of gaseous substance. Rapid rotation arising in this gaseous mass, it took the form of a disc, and at last inertia (popularly but erroneously called centrifugal force), overcoming cohesion, whole rings and fragments flew off from this disc, and by gravitation contracted into spheroid masses. As, in the original mass, the velocity of the outer circle of each body thrown off is greater than the inner circle, this causes each spheroid to revolve on its own axis. This process goes on, and the central mass continues to cool and shrink until we have at last a central body with a number of smaller spheroidal bodies revolving around it in orbits; the smaller, the nearer they are to the central orb. Certain points are assumed in this hypothesis to explain the distribution of matter in our solar system. It is assumed that in throwing off great masses from the central disc, immense quantities of minute particles were also thrown, which continue to revolve, in the same plane with the large mass around the central body. By slow degrees these minute atoms, by the law of gravitation, were aggregated into the mass nearest to them. These subordinate aggregations would form with most difficulty nearest the large central mass, because of the superior attractive force of the latter, wherefore the interior planets—Mercury, Venus, the Earth, and Mars—are smaller than the two great orbs in the zone beyond them. These two enormous planets, Jupiter and Saturn, occupy the space where conditions are most favorable to subordinate aggregations; but beyond them the gravity of aggregating material becomes reduced, and so the planets found in the outer zone, Uranus and Neptune, are smaller than the planets of the middle zone. This hypothesis was first suggested by Sir William Herschel, and was adopted and developed by Laplace. It has been called the Laplacian or gaseous nebular hypothesis.

Meteoric Hypothesis. This is a modification of the Laplacian hypothesis and was worked out by G. H. Darwin. It supposes that the parent nebular matter was a swarm of meteors which acted as a coarse gas and coalesced under the dynamic laws of gases.

Planetesimal Hypothesis. This supposes the aggregation of infinitesimal planetoids by a process of accretion. The parent nebula was of the common spiral type in a finely divided solid or liquid state. The knots of the nebulæ were the nuclei of planets resulting from the accretion of the nebulous haze. The orbits were elliptical and crossed one another in the shifting of the ever-varying mass. At each crossing the process of accretion went on; the growth was exceedingly slow; and as the mass increased in density,

and size, the internal temperature rose higher and higher. This hypothesis has been greatly advanced and elaborated through the efforts and contributions of Prof. T. C. Chamberlin and Dr. F. R. Moulton. It differs widely from the gaseous, molten-mass theories of the Laplacian and meteoritic hypotheses, overcomes many of the objections to both of these, and is rapidly assuming the form of a tenable, satisfying explanation of the origin of the earth.

GEOLOGIC DIVISIONS:-

Cenozoic,	Present. Pleistocene. Pliocene. Miocene. Oligocene. Eocene.
Mesozoic,	Upper Cretaceous. Lower Cretaceous (Comanche or Shastan). Jurassic. Triassic.
Paleozoic,	Permian. Coal Measures or Pennsylvanian. Subcarboniferous or Mississippian. Devonian. Silurian. Ordovician. Cambrian.
	Great Interval.
Proterozoic,	Keweenawan. Interval. Animikean or Penokean or Upper Huronian. Interval. Huronian.
	Great Interval.
Archeozoic,	ARCHEAN COMPLEX: Great Granitoid Series including Laurentian. Great Schist Series or Mona, Kitchi, Lower Keewatin, Coutchiching, or Lower Huronian.

Archeozoic Era.—The Archeozoic era is the age when the oldest accessible rock formation was made. The name Archeozoic (oldest life) implies that the oldest accessible rocks were made at a period when life in some form existed in the world. There is some reasonable doubt whether there may not be some rocks now accessible whose formation antedated the existence of life. To meet this doubt the term Archean Complex is used to cover the terms Azoic and Eozoic used in the older geological nomenclature. The Archean rocks include those igneous and meta-igneous rocks which antedate the oldest sedimentary formation. Archean rocks are the result of great volcanic activity; and are classed as a great schist series and a great granitoid series. To the former belong the formation of the Lake Superior region; to the latter, the granites and gneisses known as the Laurentian —a name derived from the St. Lawrence River in Canada, where the formation is abundant and where the largest surface area of Archean rocks in America lies. The peninsula of Labrador, thence to the Great Lakes, thence east of the valley of the Mackenzie to the Arctic Ocean is largely occupied by Archean rocks. In the United States they occur in a broken series of tracts from Maine to Alabama, along the western side from New Mexico to Alaska, and tracts in Michigan, Wisconsin, Minnesota, and in the Adirondack region of New York. No fossils have been found in Archean rocks, though there are strong indications that life in some form was present. The only statement that can be made regarding the duration of the Archeozoic era is that it was very long indeed; perhaps it exceeds that of all subsequent time.

Proterozoic Era.—This term corresponds to the term Algonkian used in other systems. The period includes the time which elapsed from the time of the formation of Archean rocks and those of the Paleozoic era when life was very abundant. The fossil remains and evidences of life in the rocks of this era are very meager; yet it is very significant that the oldest well-defined fossil of the era is a crustacean, which occupies a high place in animal development. Characteristic traits of rocks of this era are weathering of rocks and sedimentation,—both marks of long exposure to atmospheric and water agencies and erosion. Proterozoic rocks are classified according to age into three groups: (1) The Huronian, from the region north of Lake Huron, where the formation was first clearly distinguished; (2) the Animikean or Penokean, named from the occurrence of the formation in localities in Minnesota and Wisconsin respectively; and (3) Keweenawan, from the Keweenaw peninsula in northern Michigan on the shore of Lake Superior. Each of these formations is thousands of feet in thickness, and consists of such sedimentary rocks as conglomerates, shales, limestones, sandstones, and quartzites. In addition to the localities mentioned, there are a few scattered areas in the United States in which Proterozoic rocks are found. They are rather more abundant in Canada. It is among the Archean and Proterozoic rocks in the region of Lake Superior that the enormous deposits of iron ore are found,—more than are to be found in any other region of equal area anywhere in the world. The fact that Proterozoic sedimentary rocks are known to be 30,000 feet thick and that these are separated by periods of unconformity make it extremely probable that duration of the Proterozoic era, while this vast deposit of nearly six miles in thickness was being laid down by the waters which carried it, must be reckoned by millions, if not tens of millions, of years.

Paleozoic Era.—This first era of abundant life is divided into periods as follows: (1) The Cambrian, (2) the Ordovician, (3) the Silurian, (4) the Devonian, (5) the Subcarboniferous or Mississippian, (6) the Coal Measures or Pennsylvanian, and (7) the Permian.

1. *The Cambrian Period.*—The Cambrian period is divided into Lower or Georgian (Vt.); Middle or Acadian; and Upper or Potsdam (N. Y.), Saratogan or St. Croix. Lower and Middle Cambrian rocks occur on this continent in two general regions, one in the east and one in the west. The first extends from Labrador, Newfoundland, New Brunswick, Nova Scotia, through New England, the Hudson-Champlain valley, across the Appalachian mountains to Alabama (but not near the Atlantic coast). The western area extends northward from the Great Basin region to the Arctic. The presence of marine fossils within the areas mentioned shows that they were covered by the sea in Cambrian times. The Upper Cambrian, Potsdam, Saratogan, or St. Croix epoch saw the Appalachian and the Cordillera regions still under water and also

a large part of the interior of the continent now submerged. The Upper Cambrian formations are believed to lie over nearly the whole of that part of the United States between the Appalachian and the Rocky Mountains. The fossils found in Cambrian rocks are chiefly species of trilobites among which the genera *Olenellus, Paradoxides, Olenoides,* and *Diplocephalus* are notable examples. Cambrian rocks are shale, as near Quebec (5,000 to 6,000 feet thick); shale on limestone, as between the Adirondacks and the Green Mountains; from 10,000 to 12,000 feet of slate (shale) and sandstone on limestone, as in Washington County, N. Y.; shale or slate and sandstone or quartzite, as in Tennessee and North Carolina; and shale, sandstone, and limestone 10,000 feet thick, as in Georgia and Alabama. Estimates of the duration of the Cambrian period range from 1,000,000 to 3,000,000 years.

The Ordovician or Lower Silurian Period. This period is subdivided into Lower Ordovician or Canadian, Middle Ordovician or Mohawkian, and Upper Ordovician or Cincinnatian. There is such difference in both the thickness of Ordovician sedimentary rocks and in the nature of the rocks themselves that it is difficult to give in general terms any fitting description of the geological movements and transformations which will apply to the continent as a whole. Sections descriptive of the country vary so that many terms of only local application must be used. Limestones, dolomites, shales, and slates predominate; the marbles of the Taconic Mountains; the oil and gas wells of Ohio and eastern Indiana have their sources in this formation; the lead and zinc ores of Wisconsin, Iowa, Illinois, and Missouri are found in its rocks; and the phosphatic Ordovician limestones of Tennessee yield fertilizing phosphates. Life during the period continued in an unbroken series from the Cambrian. With the geographical changes in the contour of the continent there came an addition to the life, most noticeably in the appearance of vertebrates in the form of fish-like fossils found near Cañon City and elsewhere in Colorado. It was during the Ordovician period that the trilobites, so abundant in the Cambrian period, reached the highest point in number of genera—77 genera of Ordovician trilobites being known as against 53 Cambrian and only 31 Silurian. Fossil remains include also the cephalopods, the largest form of Ordovician life; gasteropods; pelecypods or lamellibranchs; brachiopods, the most common fossil of the period; bryozoans; echinoderms; cœlenterates or corals; sponges; annelids, and protozoans.

Silurian or Upper Silurian Period. Among the great continental changes it is supposed that during the last stages of the Ordovician period and the earlier part of the Silurian period large areas of the continent of North America slowly emerged from the great sea which had for so long covered so much of it. Mountains slowly and very gradually emerged, and there was more land surface than there had been at any previous period since the early Cambrian days. The oldest rocks of the Silurian system are the Oneida. These rocks are chiefly sandstone and conglomerate, containing many quartz pebbles. The Oneida also forms the crest of the Kittatinny range in New York, Pennsylvania, and New Jersey. The Medina formation of sandstone and shale lies above the Oneida. The third oldest Silurian formation is the Clinton, which extends farther west to Lake Huron and Indiana, and south into Alabama and Georgia. Clinton rocks are mainly sandstone and shale containing iron ore; in New York, Alabama, and Wisconsin. The earlier periods containing large deposits of iron ore are the Archeozoic, Huronian, and Animikean. The Niagara formation covers a great deal of New York, Ontario, Ohio, the southern peninsula of Michigan, parts of Indiana, Illinois, Wisconsin, and Iowa. The Niagaran rocks are shale, limestone, and some well-defined coral reefs. The Salina group contains deposits of limestone, shale, and rock salt, and, sometimes, gypsum. Beds of rock salt occur in New York, sometimes from 40 to 80 feet thick; four salt beds mixed with shale are known near Cleveland. In the Silurian period echinoderms, including blastoids, crinoids, cystoids, starfishes; brachiopods; cephalopods; bryozoans; corals; few trilobites (only 31 genera, of which 11 were new); sponges; and a few fishes, the only representatives of the vertebrates. The largest animals were the crustaceans, the great *Eurypterus* (one and one half feet long) and the *Pterygotus* (which in the next period, the Devonian, attained a length of six feet). The earliest known scorpions occur in Silurian rocks.

Devonian Period. Lower Devonian includes the Helderbergian and Oriskanian series. Helderbergian rocks are found in Maine, Gaspé, New Brunswick, and Nova Scotia; in the Appalachian belt; and in the lower Mississippi basin. The rocks are largely limestone, and run from 300 to 600 feet thick in New York and Pennsylvania, and in Gaspé there is a bed of limestone 2,000 feet thick, partly Helderbergian. The Oriskany formation is found in the Appalachian district, in the Mississippi basin, and in the St. Lawrence basin. Cumberland, Maryland, is the center of the Oriskany belt. Middle Devonian includes the Onondaga limestones in New York and east of the Mississippi, and the Hamiltonian or Erian series in the same areas and southward consisting largely of shales and limestones. The Upper Devonian consists of the Tully, Genesee, Portage, or Senecan formations of limestones, Genesee shales, and limestones; the Chemung and Catskill formations of the Chautauqua series, conglomerates, red shales, and sandstones. The Devonian rocks yield oil and gas in western Pennsylvania, southwestern New York, West Virginia, and Ontario (Canada); black phosphates of Tennessee. In the Devonian period there was a marked increase in the mollusks, both in number and development; in the Onondaga period true marine fish are found in great beds and masses near Columbus, Ohio, and at North Vernon, Indiana corals were profuse; cephalopods developed notably. Sharks 20 feet in length occur in Hamilton or Erian rocks. Brachiopods reached the period of highest development in the Devonian period,—about 103 genera being known. Plant life is represented by marine plants (algæ); land plants included ferns, tree-ferns, equisetules (horsetails), and calamites, and other gymnosperms. Wings and other fragments of insects, undoubtedly Devonian, have been found at St. John, New Brunswick (Canada), which resemble neuropters, one

having a wing spread of perhaps five inches. From the same locality are reported terrestrial mollusks, myriapods, arachnoids, and a scorpion.

The Subcarboniferous, Lower Carboniferous, or Mississippian Period. In earlier classifications, the entire period from the close of the Devonian to the end of the Paleozoic era was called the Carboniferous period; but it has been thought well to subdivide it more closely. A great continental submergence followed the Devonian period. Beds of Mississippian rocks are thickest in the Appalachian Mountains; in Pennsylvania there is 1,400 feet of Pocono sandstone with 3,000 feet of Mauch Chunk shale upon it; in Maryland the deposit is 1,300 feet thick; in West Virginia, over 2,000 feet thick; in Oklahoma, 1,800 feet; in the Black Hills, about 400 feet; in Colorado, about 500 feet; near the Grand Cañon of the Colorado in Arizona, 1,800 feet. The crinoids reached their highest development in the Mississippian period, 63 genera being known; spirifers, pelecypods, brachiopods, and gasteropods (some air-breathers) were known; cephalopods and trilobites were rare; 400 species of fish are known from America, chiefly sharks. The plants of the Devonian period persisted. The footprints of a supposed land animal or amphibian, the *Paleosauropus primaevus*, found in the Mauch Chunk shale near Pottstown, Pa., show six double imprints with the track of the hind foot partly overlapping that of the fore foot. The stride is 13 inches and the width of the track between outer toes is eight inches. Marks of a trailing tail are also seen. No fossil remains of insects have been found.

Carboniferous, Coal Measures, or Pennsylvanian Period. This system is divided into the Pottsville conglomerate or millstone grit and the coal measures, which consists of beds of shale, sandstone, conglomerate, limestone, coal, and iron ore in a succession of alternating series. The productive areas of coal deposits in North America are (1) the anthracite field of eastern Pennsylvania, 484 square miles; (2) the Appalachian field running from northern Pennsylvania to Alabama, 850 miles long and covering 70,800 square miles; (3) the Northern Interior field in the southern peninsula of Michigan, covering 11,000 square miles; (4) the Eastern Interior field in Indiana, Illinois, and Kentucky, covering 58,000 square miles; (5) the Western Interior and Southwestern fields, from northern Iowa to central Texas, 800 miles in length and covering 94,000 square miles, taking in parts of Iowa, Nebraska, Missouri, Kansas, Arkansas, Oklahoma and Texas; and (6) the New Brunswick-Nova Scotian field on both sides of the Bay of Fundy, covering 18,000 square miles. The Coal Measures present most interesting studies in plant and amphibian life. These are the first marked examples of land life, the forerunners of the land vertebrates. There are more specimens of terrestrial plant and animal life to be found in the Coal Measures than in preceding or succeeding periods, not, perhaps, because more plants and animals lived but by reason of the remarkable preservation of so many fossil remains in the coal beds. The pteridophytes were highest in the scale; gymnosperms ranked second; angiosperms had not yet appeared; and there are some traces of bacteria. Among the pteridophytes were the true ferns, fern-like gymnosperms, calamarians, and other horsetails, giant lycopods, all in great profusion. Land animals included amphibians, insects, spiders, scorpions, and myriapods. Fresh water and salt water life was abundant, and embraced all of the representatives of preceding periods; the crinoids and the trilobites were fast disappearing.

The Permian Period. This is the last of the Paleozoic Era, and is by many regarded only as a continuation of the Carboniferous. During this time large parts of the central and eastern portions of the United States emerged from the epicontinental sea, which now contracted into lakes and inland seas connecting with the ocean in part. It was during this period that the so-called "Upper Barren Coal Measures" of Pennsylvania, West Virginia, Ohio, and Maryland were laid down by the process of sedimentation. The Permian strata are perhaps best seen in Texas, Kansas, and Nebraska, which at this time were under comparatively shallow water. In the first of these localities depths of from 4,000 to 7,000 feet of sedimentary Permian rocks are not uncommon. By the time of the close of the Paleozoic Era, the Appalachian Mountain system had developed; the Ouachita Mountains were defined; and the submerged part of the continent had greatly decreased in area. From these changes in the geographical aspect of the country, it is only consistent to infer corresponding changes in climate, water circulation, and in the distribution of plants and animals. The amphibians were a prominent feature of the Permian period, as they were in the Carboniferous; the primitive reptiles made their appearance, or greatly increased, in the closing ages of the Paleozoic era. The Permian fish, both fresh water and marine, were both abundant and highly developed.

Mesozoic Era. This era is divided into (1) the Triassic period, (2) the Jurassic period, (3) the Comanchean or Lower Cretaceous period, and (4) the Upper Cretaceous period.

The Triassic Period. Triassic strata are known in the Atlantic slope east of the Appalachians, in the western interior, and on the Pacific coast. On the Atlantic slope the Triassic patches extend from Nova Scotia to South Carolina, and are grouped under the name of Newark, from Newark, N. J. Here the Triassic rocks are conglomerates, breccias, sandstones, shales, and some limestones. The Triassic beds vary from 3,000 to 15,000 feet in thickness. In the western interior, Triassic deposits are found in Texas, the Black Hills of South Dakota, and interruptedly from New Mexico to British Columbia along the eastern slope of the Rockies, for the most part unsatisfactorily distinguished from the Permian rocks. The beds run from 100 to 2,500 feet in thickness. On the Pacific slope the Triassic system has its greatest development in America. In the West Humboldt range of Nevada the beds are 17,000 feet thick. In the summits of the Sierras in northern California and up the coast to Queen Charlotte Islands the deposits are notable. This great development of Triassic rocks in the West is due to the fact that the Pacific Ocean borders were far inland over what is now the Pacific coast. The most remarkable feature of plant life in the Triassic

period was the predominance of the gymnosperms, which took the place which the pteridophytes held in the Carbonaceous period. Conifers and cycads were foremost. Among land animals many of the Permian period persisted, but the higher forms of reptiles appeared in the Triassic. The dinosaurs, the chelonians or turtles, the plesiosaurus, the crocodiles, and ichthyosaurs were prominent on land. In sea life the ammonites held first place, followed by the pelecypods and gasteropods among the invertebrates.

Jurassic Period. It is extremely doubtful whether any Jurassic rocks are to be found on the eastern coastal plain. Marine Jurassic beds of limestone were recently discovered in Texas; and some are known in eastern Mexico. But it is along the line of the Rocky Mountains and on the Pacific coast that the large Jurassic deposits are found. The system, however, does not exceed 2,000 feet in depth in California; but in western Nevada it is sometimes from 5,000 to 6,000 feet in depth, made up of slates or limestone. Marine life predominated; the ammonites still lead among invertebrates; sea urchins were rapidly and markedly developed; crabs and modern types of crustaceans appeared; sponges and foraminifera were abundant; and the great sea reptiles, such as the ichthyosaurs, plesiosaurs, and sea crocodiles, reached their highest development in this period, and present a most remarkable and wonderful fauna. Among plants the cycadeae were so distinctive that the Jurassic has been named the "age of cycads"—yews, cypresses, arbor vitæs, pines, and ginkgos. On land the dinosaurs and other carnivorous reptiles attained remarkable size; the herbivorous dinosaurs developed greatly, and soon eclipsed in size the carnivorous species. One herbivorous dinosaur found in Wyoming measured 75 feet in length; while a carnivorous dinosaur from Colorado measured only 17 feet in length. The stegosaurus of Colorado and Wyoming is a remarkable specimen of an armed dinosaur. The pterosaurs were the first development of aërial reptile life which we know about, and included the rhamphorhyncus and pterodactyl. The earliest known bird was the *Archeopteryx macrura*. The insects included cockroaches, crickets, flies, and ants, but no butterflies or moths, as there were as yet no angiospermous plants.

Lower Cretaceous or Comanchean Period. At the beginning of this period the greater part of North America was above sea level. Texas and Mexico were under water as far north as the Ouachita Mountains; the sea then flowed over the great central plain from the Mackenzie River on the north to the Rio Grande on the south; later, this great mediterranean sea disappeared. The Lower Cretaceous along the Atlantic coast is called the Potomac series; along the eastern part of the Gulf coast it is called the Tuscaloosa series. The system passes over Texas into New Mexico, and probably Arizona, into Kansas. In the northern interior, Lower Cretaceous occurs in parts of Wyoming, South Dakota, and Colorado; farther north it is seen in Montana, Alberta, Assiniboia, and the Queen Charlotte Islands. On the Pacific coast it is seen in California, Oregon, Washington, and British Columbia. Each of these parts have local names and subdivisions which serve to complicate a by no means simple period. A most important phase of the Lower Cretaceous period is the introduction of angiosperms, both monocotyledons and dicotyledons, which appear first in the Potomac series, and had so fully developed that in the succeeding period they had overrun the continent. These early angiosperms were plants familiar to us, including the sassafras, laurus, eucalyptus, and myrica. The cycads, conifers, and ferns which dominated preceding periods, now sank to a subordinate place.

Upper Cretaceous Period. Further exposures of the continent occurred in the Upper Cretaceous period. New Jersey, Delaware, Maryland, and Virginia are among the parts which then emerged. Beds of clay, sands, greensand marl, with but little limestone, are characteristic of this area. Along the Gulf coast these beds extend from Georgia, through Alabama and Mississippi to western Tennessee and Kentucky. In the interior they are found in Texas, Kansas, and to the north. On the Pacific coast the rocks of this period are found, somewhat scattered, in California, Oregon, Washington, and British Columbia. The plants of the Upper Cretaceous period had a distinctly modern or present-day appearance, many of our varieties of angiosperms being abundant; monocotyledons, including palms and grasses, were becoming abundant, and the new flora was widely distributed. Among animals the dinosaurs were still predominating, and presented most peculiar forms. The flying reptiles had developed, and some presented a wing-spread of 20 feet and had great powers of flight. Sea animals included a few, but gradually disappearing, ichthyosaurs and plesiosaurs, and many and important types of sea serpents, sea turtles, and sea birds. Rhizopods or foraminifers were more prominent than in any preceding period, and sea urchins were conspicuous.

Cenozoic Era. This embraces all of the remaining periods of the geological history of the earth, and is the era of modern life.

The Eocene Period. Land formations of the Eocene period are (1) marine deposits found on the borders of the continent, especially around the Gulf area, on the southeastern Atlantic coast, in the West Indies, and on the Pacific coast; (2) brackish water deposits in Washington and Oregon; and (3) fresh water deposits from lakes, river, ponds, etc., in scattered regions among the mountains of the West and upon the adjacent plains. Eocene life shows very marked differences from that of the Cretaceous period. Marine life was almost wholly changed; the great saurians disappeared; the reptile forms were markedly transformed; and placental mammals took a commanding position, probably on account of the development of the angiosperms which afforded food for the grass-eating herbivores, that in turn supplied food for the carnivores. While these animals were very different from those with which we are familiar, there may be traced back to them the descent of modern types. They were the ancestors of our types, and the great number of genera which were represented and the suddenness of their development are points of interest in the period.

The Oligocene Period. The Oligocene has not been used in the older systems of geological classifications of North America, but has been prominent in Old World geology. To secure

uniformity and to aid paleontological classification, it is now being recognized as a distinctive period between the Eocene and the Miocene. The rocks which are considered as belonging to the Oligocene period are certain marl beds on the Atlantic coast in North and South Carolina and some in Florida; the Gulf formations of Alabama, Mississippi, Louisiana, and part of Texas; and extensive areas in Colorado, Wyoming, Nebraska, and South Dakota. It is interesting to note that amber, a fossilized resin found on the Baltic shores, occurs in the Lower Oligocene of Europe. Amber is of great paleontological importance as a natural means of preserving insects. They, it is supposed, alighted upon the resin when it was soft and became imbedded in it, so that about 2,000 species of Oligocene insects have been thus preserved, entombed in the amber. The trees of the Oligocene period were both evergreen and deciduous,—yews, pines, sequoias, but very few palms. Among the land animals were such as the *Titanotherium validum* (a skeleton of which is in the Carnegie Museum in Pittsburg), which were midway between the rhinoceros and the elephant, the *elotheres* or giant hogs, and the three-toed horses.

The Miocene Period. Miocene formations are marked by slight coastal additions to the southeastern Atlantic coast, to the Gulf coast, along the Pacific coast, and in the interior in Nevada, Montana, Arizona, Texas, and New Mexico. The Miocene rocks are of nearly all of the sorts common to sedimentary deposits of marine and fresh water. The flora of the Miocene period was little different from that of the Oligocene, excepting in an increase in deciduous trees and grasses. The disappearance of some of the tropical and subtropical plants argues a change in climatic conditions. The horse, the tapir, the lowland rhinoceros, peccaries, camels, squirrels, beavers, gophers, and rabbits persisted from the Oligocene period. To these were added the mastodon or elephant forms, especially the Tetrabelodon, Dibelodon, and the ruminants of the deer and ox family. Little is known of Miocene birds. Turtles, lizards, and crocodiles had taken on their modern forms.

The Pliocene Period. Pliocene formations, so far as known, cover an area similar to those in which Miocene deposits are found. There was an upbuilding of the peninsula of Florida, and the shores around the Gulf, and for a short distance up the Atlantic coast, and along the Pacific coast. These deposits were, of course, marine. The lacustrine and other fresh water deposits are known in the interior east of the Rocky Mountains, on the border of the Great Plain; the auriferous gravels of California began in the Miocene and continued through the Pliocene. Patches of gravel are found in Minnesota, Wisconsin, Iowa, Illinois, Arkansas, Indiana, Kentucky, and Tennessee, which are referable to the Pliocene period. The Lafayette formation, named from Lafayette County, Miss., is composed of gravel, sand, silt, and clay welded together.

The Pleistocene or *Glacial Period.* The great feature of the Pleistocene period was the covering of from six million to eight million square miles of the earth's surface with ice sheets. Just previous to this covering with ice, the districts so covered had enjoyed a mild climate. This fact is so striking that it tends to obscure other important events in the period. Nearly one half of North America was buried under ice. The three centers were (1) Labrador, (2) Keewatin, just west of Hudson Bay in Canada, and (3) the Cordilleran ice sheet in the Rocky Mountains in Canada. The southern well-defined limit in North America ran in an irregular line from New Jersey, west through Pennsylvania, Ohio, Illinois, Missouri, Kansas, and Nebraska, and northwest through Montana, Idaho, and Washington. In the east its southern boundary nearly followed the course of the Ohio River, and the most southerly point of the lowland glaciation reached was about 37° 30′, near what is now the mouth of the Ohio. Mountain peaks and eminences south of this line were affected, but in widely scattered localities. About one half of the glaciation of the entire world was in North America, and about one half of the remainder was in Europe. A strange feature is the fact that Alaska was only slightly affected. The area over which the ice spread is now covered by clay, sand, and bowlders, and this mantle is called the drift. The great bowlders have been in many cases forced into unusual and strange positions by the ice flow. The bowlders and the bed rock are marked with grooves and striæ caused by the pressure of the superincumbent mass. The drift ranges in depth up to 500 feet. The drift is classified into ground moraines, terminal moraines, and lateral moraines. These moraines are great heaps of bowlders, gravel, clay, and sand. The terminal moraines mark the advance and retreat of ice sheets. Migrations of both plants and animals mark the extraordinary changes of temperature which accompanied the Glacial period. There is evidence of five or six backward and forward movements, some of which, it is believed, covered fully 2,000 miles in North America, and exceeded 1,000 miles in Europe. This alternate advance and retreat of the ice sheet resulted in a marked intermingling of floras and faunas. In Great Britain remains of the musk ox, now exclusively arctic, have been reported as found along with those of the hippopotamus, now strictly tropical; and in France the relics of the reindeer are similarly associated with those of the lion. The climate of some interglacial epochs was evidently warmer than at present. In the Toronto beds, remains of the papaw and osage orange and other trees occur, now reaching their average northern limits about 300 miles farther south. South of the ice sheets in North America the mammoth, mastodon, bison, reindeer, and musk ox were abundant and characteristic animals, while the saber-toothed cat, tapir, llama, and horse were nearly extinct. The mammoth was abundant in Mexico and the southern states, and ranged northward. The mastodon occupied a large area in the northern states, extending into Canada, and the south. The musk ox and reindeer occurred as far south as Virginia.

While most European geologists have concluded that man was present in central and southern Europe during the later part of the glacial period, convincing evidence of glacial man in North America has not been discovered. The final retreat of the ice sheets from middle latitudes terminated the Pleistocene and marked the beginning of the Present or Human period.

BIOLOGY.

Biology is the science of life; the study and knowledge of living beings and organized matter as distinguished from inanimate things or inorganic matter. In a broad sense it may be understood to include every form and function of living beings, and under this conception all human knowledge, together with every achievement of human progress, are facts of biological science. However, as generally understood, biology treats of the origin, structure, development, function, reproduction, and distribution of plants and animals.

Evolution.—The theory of evolution, comprehensively considered, attempts to account for the origin of created things, particularly the earth, with its past and present plant and animal life, including the origin and development of the human race. It is concerned with problems of development, ranging from that of the formation of a star from nebular or planetesimal matter to the production of the sugar beet by husbandry, and from those involving the simplest volitional acts in animals to the transcendent powers of the human mind. This theory, which possesses the greatest philosophical and scientific significance, has its foundation in certain unities, universally existent and demonstrable. Among these are the universality of natural laws, unity of structure in plants and animals, and in their mode of reproduction,—all arising from germs or eggs; the universal presence of protoplasm as the material basis of life, and the contractility of protoplasm as the source of all movements of plants and animals. From the philosophical point of view, all this implies an infinite power or creator working in and through the material and immaterial universe by unchanging natural laws.

Inorganic Evolution considers the development of the material universe, particularly that of the solar system and the earth, the latter involving the origin of the minerals composing its mass, and the formation of the air and water. Chemical evolution takes into account the gradual upbuilding of matter from its ultimate, preëlemental particles to the elemental condition, thence through molecular compounds of increasing complexity to the most complex of all—protoplasm, the material basis of life, which marks the limit of physico-chemical development.

Organic Evolution is a theory of descent, of development from simple, general types to complex, specialized forms, and undertakes to account for the origin of species by the operation of natural laws.

Aristotle (384-322 B. C.), the greatest philosophical naturalist of the ancients, is considered the father of the theory of descent. He conceived a series of organisms intergrading from jellyfishes to man, and asserted his belief in heredity. St. Augustine, in the fourth century, explained the origin of things by a series of causal factors. Nine hundred years later Thomas Aquinas supported this teaching. However, beginning in the sixteenth century and continuing until after the middle of the nineteenth, the doctrine of special creation was universally maintained. A few, however, questioned it. Among them was the German philosopher, Leibnitz (1646-1716), who declared his belief in the continuity of nature, and in a universal connection between species, which he maintained could be changed by a change in environment. The French naturalist, Buffon (1708-1788), asserted that all animals may have originated from a single ancestral type, affirming, and as often denying under hostile criticism, his belief in the mutability of species. Erasmus Darwin (1731-1802), grandfather of Charles Darwin, maintained that all animals have developed from a single primordial "filament," and more or less clearly defined sexual selection, protective mimicry, the law of struggle, the effects of climate and of use and disuse as causes of variation.

The great French naturalist, Lamarck (1744-1829), who was the true founder of modern evolution, published his views extensively during the first decade of the nineteenth century. He taught that all organisms develop from germs, that development is always from the simple to the complex; that vestigial structures, such as the internal limb bones of whales or the vermiform appendix in man, are remains of once actively used structures, and that characters acquired during the life of the individual, particularly the effects of use and disuse, may be inherited. These views were vigorously opposed by Cuvier, and were generally discredited until Charles Darwin and Alfred Russell Wallace, acting independently of each other, formulated the great theory of descent which has revolutionized all scientific teaching.

In 1859, after more than 20 years of the most painstaking research, following a notable five years' journey around the world as a naturalist, Darwin published his epoch-making "Origin of Species," containing overwhelming arguments for the doctrine of descent. These views, ably supported by Huxley, Herbert Spencer, Haeckel, Asa Gray, and others, became widely accepted by philosophers and scientists. The chief tenet of the new theory was natural selection. Darwin maintained that among plants and animals there exists an all-prevailing tendency to fortuitous variation; that when variations are favorable to the organism they are preserved; that natural selection, otherwise stated by Herbert Spencer as "the survival of the fittest," is a determining factor in preserving variations. Darwin did not claim that this process of elimination, resulting in the permanency of the best adapted, is the only factor in organic evolution, but emphasized that it is a most important one. Stimulated by the masterly example of Darwin, who was an investigator of the highest order, subsequent research in comparative anatomy, embryology, and paleontology has contributed a vast mass of confirmatory evidence, and established practically universal belief in the theory of descent. Present day scientists, however, are not agreed as to the relative significance of the now recognized factors of evolution, including that of natural selection itself, which is being subjected to rigorous review, and undoubtedly there are unknown, and, possibly, there are undiscoverable, factors in evolution.

Mental Evolution, which lies at the basis of social and religious evolution, is exemplified in the fact that, while man is the only fully self conscious reflective, thinking animal, it is impossible to establish a line of demarcation between the mental acts of animals and of man. The beginnings of reason are manifest in animals,

and, notwithstanding the immense difference between the mental attributes of man and the rudimentary faculties of animals, there is evidence that his exalted intellectual qualities had their origin in the animals which preceded him in development. The difference in the size and shape of the skull between the living and most ancient fossil races of mankind, the evidence found in the vestigial structures inherited from other animals, the culture-record of man,—his gradual mastery of the elements, of fire, tools, soil cultivation, subjugation, and domestication of animals, of the useful arts, sciences, and fine arts; his recognition of ethical principles, of the divine in the universe and in human nature, all indicate a development from the simple to the complex in full harmony with the principles of evolution.

The establishment of the theory of evolution is the greatest intellectual achievement of this age. Not only have important discoveries in biological science arising from stimulated research, such as the germ origin of disease and antitoxin treatment, been of great benefit to mankind, but in the realm of modern economics, sociology, psychology, and ethics the principles of evolution have been profoundly influential. The evolution theory, with its immediate corollaries, has immensely enlarged our conception of Deity, of the universe, of the world, its history and life, and of man's past, present, and future place in it.

BOTANY.

Botany is the science of plant life. Plants may be considered from different points of view, each resulting in a distinct division of the science of botany.

Structural Botany or **Morphology** is the study of the form and structure of plants, more particularly of the shape and relation of their parts or members. It passes into plant anatomy or histology, which deals with the finer, for the most part microscopic, characteristics of vegetable tissues.

Physiological Botany or **Plant Physiology** is the study of the plant in action, its life processes and functions.

Cytology is the study of the cells, the fundamental elements from which all plant structures are developed.

Systematic Botany or **Taxonomy** is the study of the classification of plants, and of their grouping into floras.

Ecology or **Plant Sociology** is the study of the relations of plants to other plants, and to animals, and of their adjustment to their physical surroundings.

Economic Botany is the study of plants in relation to their usefulness to man.

Paleobotany or **Geological Botany** is the study of fossil plants, of extinct plant life,—a subject which derives its chief interest from the important light it throws upon the ancestry, development, and affinities of existing vegetation.

Genetics. Under this name, of rather recent introduction, are grouped the various phenomena of plant and animal heredity.

Morphology. The organic unit of plant life as of animal life is the cell, the essential element of which is protoplasm or life substance. All plant structures or organs, no matter how large or complex, arise from combinations of these cells.

In the simplest plants the plant activities, such as nutrition, reproduction, respiration, and movement, are all carried on in a single cell, but as we ascend in the scale of development, increasingly complex structures for the carrying on these activities appear. In the liverworts there are expansions of simple cellular tissue into leaf-like organs but lacking the distinctive structure of true leaves. In mosses imperfect structures considerably resembling, not only leaves, but stems and roots, appear, and finally, in the fern plants, true plant vessels and woody tissue are developed, and hence highly organized true roots, stems, and leaves occur. Along with this increasing complexity of structures connected with the nutritive functions, there occurs also an equal advance in structures concerned with the other functions, until, in the seed plants, we find almost infinite variation in form, structure, and adaptation of various plant organs, innumerable forms of leaves which have to do with nutrition and respiration, and of floral parts which have to do with reproduction. The study of these structures has been called Structural Botany or Organography, now largely superseded by the term Morphology.

Physiology. The activities or work of the living plant may be presented under: (1) Stability of Form, (2) Nutrition, (3) Respiration, (4) Movement, (5) Reproduction.

STABILITY. In the most delicate plants with thin cell walls, rigidity of form is maintained by internal pressure upon their walls, the protoplasm of active cells manifesting this power to draw liquids within the cell wall and retain them under pressure. This turgid condition of active cells gives rise to tensions in adjoining tissues which also contributes to rigidity and permanence of form.

NUTRITION.

Food. Primarily all plant food is inorganic, and must always contain carbon, oxygen, hydrogen, and nitrogen, together with smaller quantities of sulphur, phosphorus, potassium, magnesium, calcium, and iron, all of which must be introduced into the plant in liquid or gaseous form—hydrogen and oxygen from water, carbon from carbon dioxid in the air, and the other elements in various salts dissolved by water in the soil before entering the plant.

Absorption. In all land plants possessing green parts, carbon dioxid is absorbed immediately from the air through the surfaces of the leaves. The mineral salts dissolved in water in the soil are absorbed by the roots.

Transpiration. More water with its content of dissolved salts is absorbed through the roots than is needed for food. The salts are retained but the surplus water is evaporated through the stomates or breathing pores of the leaves; the amount thus transpired by a large leaf area is very great, some trees being planted to drain marshy ground by transpiration through their leaves.

Photosynthesis. Every green plant possesses the power to manufacture, from the inorganic elements in the air and water, its own food. The process whereby the carbon of the carbon dioxid from the air and the oxygen and hydrogen of water are recombined as starch, sugar,

or cellulose, through the agency of the chloroplasts in the green cells and sunlight, is called photosynthesis. It is primal and fundamental, as organic life, both plant and animal, derives all its food ultimately from green plants, and depends for existence upon this process.

RESPIRATION. Plants need to breathe and do breathe by a process essentially similar to that of animals, oxygen entering the plant through the stomates or breathing pores of the leaves and being absorbed by the living cells, while carbon dioxid is given out by the same cells and finally escapes by diffusion.

MOVEMENT. Many low plants, such as bacteria and diatoms, possess the power of locomotion; the naked protoplasm of slime molds slowly creeps over surfaces; the zoöspores and ciliated sperms of lower plants swim freely. In complex plants locomotion mostly disappears, but certain portions of the plants move, usually slowly, but sometimes with great rapidity. Hygroscopic movements occur in dry tissues. Growth movements, due to internal causes, such as those of tendrils, and to external causes, such as turning or growing of leaves or stems toward the light (heliotropism), or of roots downward, due to gravity (geotropism), are characteristic of higher plants. The leaves of certain plants manifest marked irritability when mechanically disturbed, such as the sensitive plants, as do also the modified leaves of carnivorous plants which entrap insects.

REPRODUCTION. There are two distinct methods: Reproduction by division, which is always asexual, called Vegetative Reproduction, and Reproduction by Spores, which may be either sexually or asexually produced.

Vegetative Reproduction. In the lowest plants the method is cell division, a single-celled plant splitting into two similar single-celled plants, as in Protococcus and other lower algae, and bacteria. In more complex plants vegetative reproduction or propagation is effected by various outgrowths of the body, such as the gemmae of liverworts, and the buds, bulbs, tubers, and modified branches of higher plants.

Reproduction by Spores. Cells specially organized for spore production occur in all but the lowest groups. The first spores produced appear to have arisen from the internal division of a mother cell, and are asexual spores. But even in the higher thallophytes we find spores formed by the union of two specialized cells called gametes, which are sexual spores. Among the lowest plants the pairing gametes are alike, that is, apparently unisexual, but among somewhat higher forms they become distinctly bisexual, as sperms, or male cells, and as eggs, or female cells, and this soon gives rise to an alternation of generations between sexual and asexual spore-producing forms which prevails throughout the whole plant kingdom from the more complex thallophytes to the highest plants.

Classification or Taxonomy. Beginning with the simplest and lowest forms and progressing upward through more and more highly organized intermediate groups to the plants of the greatest development and complexity of structures, four great natural divisions are recognized, as follows:—

I. **Thallophytes,** Thallus plants.
II. **Bryophytes,** Moss plants.
III. **Pteridophytes,** Fern plants.
IV. **Spermatophytes,** Seed plants.

All known plants are readily referable to these divisions, but it does not follow that these are equivalent natural groups. Some maintain that there should be more groups of primary rank, and others hold there should be fewer, but the

---

PLANT KINGDOM.

Table of the Principal Groups of Plants.

Thallophytes or Thallus plants	Algae and Algoid forms	Cyanophyceae	blue-green algae.
		Chlorophyceae	green algae.
		Phaeophyceae	brown algae.
		Rhodophyceae	red algae.
	Fungi and Fungoid forms	Schizomycetes	fission fungi, bacteria.
		Myxomycetes	slime molds.
		Phycomycetes	algae fungi, water molds.
		Ascomycetes	sac fungi, lichen fungi.
		Basidiomycetes	basidium fungi, rusts, mushrooms.
Bryophytes or Moss plants	Hepaticae	liverworts.	
	Musci	mosses.	
Pteridophytes or Fern plants	Lycopodiales	Sigillaria and Stigmaria, Lepidodendra	(fossil).
		Lycopodiaceae	club mosses.
	Equisetales	Calamites	(fossil).
		Equisetaceae	horsetails.
	Filicales	Cycadofilices	cycad ferns
		Filices	true ferns.
Spermatophytes or Seed plants	Gymnospermae or Naked-seeded	Cycadales	cycads.
		Gnetales	gnetums.
		Ginkgoales	ginkgo.
		Coniferales	evergreens.
	Angiospermae or Covered-seeded Flowering plants	Monocotyledoneae	(one-leafed seed), cereals, palms, lilies.
		Dicotyledoneae	(two-leaved seed), oak, apple, pea, sunflower.

arrangement as stated is more widely accepted and used than any other classification.

Fundamental distinctions between these primary groups may be stated as follows:—

Thallophytes have thallus bodies, but lack the peculiar reproductive structures of the next higher group called archegonia; Bryophytes possess archegonia but lack fibro-vascular bundles, i. e., true plant ducts and woody tissue, which characterize all plants higher in the scale than Bryophytes; Pteridophytes have fibro-vascular bundles but do not produce seeds; Spermatophytes have seeds.

Thus it will be seen that in each ascending group characteristic structures have been developed not possessed by any of the groups which stand below them.

Thallophytes (*θαλλός*, young shoot, *φυτόν*, plant) are the simplest of plants and represent the initial stages of development in the plant kingdom. Wherever vegetable life exists, thallophytes constitute a part of it, being the last plants to disappear in the polar regions, on high mountains, and in the depths of the sea. In size, form, structure, and mode of life, they present immense variety; many are exceedingly minute, some bacteria requiring lenses of the highest magnifying power for their detection; others, such as diatoms and yeast plants, though microscopic are readily observed; many filamentous algae are so insignificant as to escape ordinary attention; a vast number, however, are objects of familiar notice, such as molds, mildews, mushrooms, lichens, and common seaweeds; while some of the great marine species develop enormous structures exceeding 500 feet in length. They exhibit all of the principal functions of plants though there is no differentiation of any portion of the plant-body or thallus into specialized organs such as the roots and leaves of higher plants. All are composed entirely of cellular tissue and many consist only of a single cell which performs all of the essential activities—being able either to manufacture its own food from inorganic elements, or to assimilate food prepared by other organisms, and to reproduce its kind by cell division. Reproduction is of two sorts: (1) by vegetative multiplication or fission, and (2) by spores, which may be either asexually or sexually produced—the former prevailing exclusively among the lowest forms, and persisting in all, while many multiply not only by fission, but by both kinds of spores as well;—bisexuality, which characterizes all higher plants, being clearly established in the higher algae. Thallophytes have developed in two great groups or parallel series, algae and fungi. Algae possess chlorophyll (green pigment) and sustain themselves independently, like other green plants; fungi never possess chlorophyll and are incapable of independent existence.

Bryophytes (*βρύον*, moss, *φυτόν*, plant). Moss plants. One of the four great divisions or subkingdoms of plants, ranking between the thallus plants, thallophyta, and the fern plants, pteridophyta, in organic development; readily distinguished from the former by characteristic reproductive structures, called archegonia, and by distinct alternation of generations, and from fern plants by the absence of vascular tissue. They consist of the liverworts (*Hepaticae*), which descend nearly to the thallophytes in simplicity of structure and the mosses (*Musci*), which approach the pteridophytes in development. All are green plants, mostly terrestrial, and composed entirely of cellular tissue. Liverworts possess only thalloid structures without stems or roots, and with cellular expansions simulating leaves. In mosses there are structures resembling stems and leaves which are very imperfect compared to the true stems and leaves of higher plants, as there is no vascular tissue, and there are no true roots though their function is performed by corresponding organs.

The conspicuous, independent, green plant is the sexual generation, gametophyte, and gives rise to a dependent, non-vegetative, so-called fruiting form, the asexual generation, or sporophyte, which, in turn, gives rise to a new sexual generation. Therefore, as in pteridophytes, complete alternation uniformly prevails, and, excepting the absence of vascular tissue, the most striking difference between these classes lies in the fact that while in bryophytes the sexual generation, or the gametophyte, is the leafy, visible plant and the asexual generation, the sporophyte, is not prominent, in pteridophytes the asexual generation is the conspicuous, permanent plant and the sexual generation is inconspicuous and temporary.

Pteridophytes (*πτερίς*, fern, *φυτόν*, plant). Fern plants. One of the four primary divisions or subkingdoms of plants, ranking next to the flowering or seed plants, spermatophytes, in the scale of development. The pteridophytes are distinguished at once from the bryophytes and thallophytes below them by the presence of vascular tissue, and by the possession of true roots, stems, and leaves, and on the other hand they strikingly differ from the flowering plants above them by the absence of seeds. Well marked alternation of generations occurs, and in this they differ from bryophytes in that the asexual generation, sporophyte, is the vegetative, conspicuous, nutritively permanent, independent plant, while the sexual form, gametophyte, is minute, transient, and inconspicuous. The leafy plant, sporophyte, produces spores. These fall to the ground and germinate, producing minute, green, thalloid structures, called prothallia, which bear the sex organs—antheridia and archegonia. This sexual plant, gametophyte, is distinct and independent. A fertilized egg cell on the prothallium germinates, producing the large, leafy, but asexual form or sporophyte, which in turn produces spores, thus completing the cycle of alternation. By reason of vascular tissue, and the development of strong woody fibers and conducting systems, fern plants average much larger than bryophytes, ranging in size from minute floating forms to immense palm-like tree ferns of the tropics, 40 feet high with leafy fronds 12 to 15 feet long.

Spermatophytes (*σπέρμα*, seed, *φυτόν*, plant). Seed plants. The highest of the four primary divisions or subkingdoms of plants, differing from all others by the production of seeds, and embracing the conspicuous vegetation of the earth—herbs, shrubs, and trees, and including practically all of the useful plants, cultivated or otherwise employed by man. Over 100,000 species have been described by botanists, divided into two well-marked but very unequal natural groups:—

Gymnosperms, which produce naked seeds, immensely abundant in earlier geologic ages but now represented by only about 400 living species.

Angiosperms, which produce seeds in closed ovaries, now overwhelmingly predominant in the plant kingdom.

While vascular tissue first appears in the fern plants it attains its highest structural adaptation and specialization in this group.

Alternation of generations is not apparent to ordinary observation and can be demonstrated only by laboratory methods and with the microscope, owing to the minuteness of the sexual generation or gametophyte. Contrary to long established popular notion, the whole visible plant is sexless and is a true sporophyte. The true sexual generations arise from spores produced by the sporophyte, but are entirely concealed within certain portions of its structure. The pollen grains discharged from the stamens of flowers, are not the male element, but are only sexless spores, just as the spores shed by ferns are sexless, but the germinating pollen grain gives rise to a microscopic plantlet which is sexual, and produces sperm cells. Likewise the pistil and its contained ovule are not the female generation but simply a spore-producing structure of the asexual plant. However, within the ovule a sexless spore (megaspore) germinates and gives rise to a few-celled plantlet which is sexual and produces the egg cell. A germinating pollen tube, containing the sperm cell, penetrates the ovule, and fertilization is effected by fusion of the sperm and egg cells. The fertilized egg cell in the female plantlet develops into the embryo and the outer walls of the ovule develop into a tough or horny coat, and this with the contained embryo and the remains of the female plantlet, endosperm, make up the seed. Three generations are thus represented in the seed: (1) the old, sexless generation, sporophyte, by the seed coat; (2) the female generation, gametophyte, by the nutrient portion or endosperm; and (3) the new, asexual generation, sporophyte, by the embryo. This group is still popularly called flowering plants, but not all produce flowers. These plants were long called Phanerogams, meaning evident sexual reproduction, but it is in fact least evident in this group. The name Siphonogama, referring to the fertilization by the pollen tube, has been proposed, but not widely used. As all produce seed, and no other plants do, the name seed plants (spermatophytes) promises to be permanent.

CULTIVATED PLANTS.

Origin.—The cultivation of plants for food and other useful purposes antedates the historical period of the human race.

It began in those remote epochs when the progenitors of the present dominant peoples, having emerged from primitive savagery, were struggling upward through barbarism by successive conquests of nature and natural forces. In common with the acquisition of weapons and tools, the use of fire and the domestication of animals, the cultivation of plants must be reckoned as one of the great factors in the progress of the race.

History.—The earliest records show that a large proportion of the plants which are still of supreme importance to mankind were well established in cultivation at the dawn of history. It is impossible to state with any degree of exactness how long the most ancient of these have been in cultivation. For example: it is known that wheat and rice have been planted by man for at least 5,000 years, but we possess no data enabling us to estimate how many centuries, or, as seems more probable in the light of modern research, how many thousands of years, these plants had been grown previous to their first mention in available records.

In China at an annual ceremony, established 2700 B. C., wheat, rice, millet, sorghum, and the soy bean were directed to be planted by royal edict.

In Egypt, wheat, barley, and millet have been found in the earliest monuments; mummies were wrapped in linen cloth, indicating the ancient culture of flax; a drawing delineating the fig occurs in the pyramid at Gizeh; the watermelon is represented in ancient paintings; and the olive, date palm, grape, lentil, bean, and lupine were among the plants cultivated in the valley of the Nile at least 4,000 years ago.

In Switzerland the lake dwellers of the Stone Age possessed wheat, the lentil, and the apple, and later, when these communities had acquired the use of bronze, their agriculture included oats, millet, the broad bean, pea, poppy, and the pear.

In Peru, Indian corn was discovered in the catacombs of the Incas, and the lima bean and peanut have been found in the tombs at Ancon, indicating an ancient cultivation and use at the period of Spanish discovery.

In Mexico, tobacco pipes in great numbers and variety of design have been found in the ancient tombs of the Aztecs, and are also found among the remains of the mound builders of North America.

Method of Diffusion.—Agriculture, in so far as the cultivation of the principal plants is concerned, was developed in three great regions of the world, viz.: (1) China, (2) southwest Asia including Egypt, *i. e.*, from the Ganges to the Nile, and (3) intertropical America from Mexico to Peru.

China had cultivated many important plants for at least 3,000 years before intercourse with India and western Asia began, about 150 B. C. At that time the broad bean, cucumber, alfalfa, sesame, saffron, pear, spinach, and watermelon were among the useful plants introduced into China from the West, which likewise began to receive cultivated plants from the far East.

In ancient times the peoples in the region between India and Egypt, including the Mediterranean basin, exchanged cultivated plants easily. The Aryan invasion of Europe, the struggles between Assyria and Egypt, various migrations and conquests, notably the expedition of Alexander the Great to India, diffused the then cultivated plants throughout the entire region so that, after the establishment of intercourse with China, this region possessed nearly all of the useful plants of the Old World. At the period of the Crusades comparatively few cultivated plants remained for exchange, although sugar cane and some minor fruits were then brought to Europe.

The discovery and settlement of the Americas was the next great event in the diffusion of cultivated plants. The potato, maize, tobacco, prickly pear, tomato, peanut, and other valuable plants were then transported to Europe and Asia, and Old World plants in great numbers introduced into the new. The slave trade with Africa and the discovery of the Pacific Islands and Australia, together with the vast extension of modern commerce, completed the world-wide dispersion of cultivated plants existing at the present day.

Order of Introduction.—The most anciently cultivated plants were those producing seeds, roots, or fruits affording substantial food for man. Among some fifty plants known to have been in cultivation upwards of 4,000 years, all but a few are food plants, none are fodder plants for animals, and only two are green vegetables. To this most ancient group belong the cereals: wheat, barley, millet, rice; the legumes: bean, lentil, chick pea, lupine; the fruits: apple, peach, apricot, olive, fig, date palm; the vegetables: cabbage, onion, turnip, purslane; and it also includes the fiber plants: flax and hemp; the dye plants: saffron and carthamine; and the beverage plant, tea.

Among the plants which have been cultivated since the beginning of the Christian era, but not definitely known to have been in cultivation for as long a period as 4,000 years, although it is highly probable that a number of them exceed it, are the cereals: oats, rye, and probably maize; the vegetables: beet, carrot, lettuce, celery, pea, asparagus, and probably the potato and sweet potato; the fruits: orange, lemon, grape-fruit, cherry, and plum; the aromatic plants: pepper and nutmeg; the dye plants: madder and indigo; the narcotic plants: poppy, betel-pepper, and probably tobacco; and the fiber plant, cotton.

During the last 2,000 years the plants brought into cultivation have been of much less general economic importance, being, chiefly, fodder plants for domestic animals, vegetables, medicinal plants, and minor fruits. No cereal grain of the first order has been established,—the buckwheat developed in Asia during the middle ages being of little consequence in comparison with the standard grains.

Among the plants developed in agriculture and horticulture during the past 2,000 years, the following are the most important: buckwheat, commonly, though incorrectly, classed as

a cereal; the vegetables: horseradish, parsnip, parsley, chicory, endive, artichoke, pumpkin, squash, tomato, lima bean, okra, New Zealand spinach (*Tetragonia*), and mushrooms; the fruits: currant, gooseberry, raspberry, blackberry, strawberry, cranberry, muskmelon, persimmon, and pineapple; the fodder plants: red, alsike, purple, and Egyptian clover, guinea grass and timothy grass; the fiber plants: jute, sea island cotton, and sisal; the aromatic plants: red pepper, cinnamon, clove, and hop; the medicinal plants: cinchona and coca; the pistachio nut and peanut, and the beverage plants: coffee, maté, and cacao (cocoa).

With the exception of those plants established or brought into extensive use subsequent to the discovery of America, the great majority of this group dates from the middle ages. In the five centuries from 1200 to 1700, little increase was made in the number of plants in cultivation. Coffee and some of the clovers appear to have become established during this period. While great diffusion and increase in the area of distribution occurred during the period following American discovery, few plants new to cultivation were developed. During the eighteenth century, the American strawberry and persimmon in the United States, sea kale in Europe, and the tetragonia from New Zealand were contributed. Of these the strawberry ranks first, having become the leading small fruit in the United States.

The adoption of scientific methods in agriculture and the invention of labor-saving machinery in the nineteenth century produced an expansion in the area of cultivation unparalleled in history. While valuable new races and varieties of previously established plants have been added, the only new plants which have assumed intercontinental importance during the past century are the blue gum (*eucalyptus*), grown for quick timber and eucalyptus oil, and the cinchona tree, the source of quinine, both dating from about 1850. In the United States during this period the list of small fruits has been increased by the development of the blackberry, the raspberry, and the cranberry, which have now attained considerable local importance.

Botanical Rank.—Cultivated plants which have risen to economic importance belong to those groups which are highest in the scale of organic development.

With the exception of the mushroom, which is a fungus, all are spermatophytes, that is, flowering or seed-bearing plants. Each of the great divisions of the spermatophytes, the endogens and the exogens, has noteworthy representatives in cultivation. To the endogens belong the cereals, the fodder grasses, palms, and a number of vegetables and fruits, while the exogens embrace the legumes and most vegetables, fruits, and fiber plants.

The plants now in cultivation are distributed among more than fifty natural families. Among the most important of these families are the following, with examples under each:—

Grass Family (*Gramineae*), including wheat, rice, barley, oats, rye, maize, millet, sorghum, sugar cane, timothy grass.

Palm Family (*Palmaceae*), containing the date palm, oil palm, cocoanut, areca nut.

Lily Family (*Liliaceae*), represented by the onion, leek, garlic, asparagus.

Mustard Family (*Cruciferae*), which includes the radish, horseradish, cabbage, turnip, watercress, mustard.

Pea Family (*Leguminosae*), containing the bean, pea, lentil, lupine, clover, alfalfa, peanut, indigo.

Rose Family (*Rosaceae*), includes the apple, peach, pear, almond, apricot, plum, cherry, quince, raspberry, blackberry, strawberry.

Parsley Family (*Umbelliferae*), represented by the carrot, parsnip, celery, parsley.

Gourd Family (*Cucurbitaceae*), includes the gourd, cucumber, watermelon, muskmelon, pumpkin, squash.

Sumac Family (*Anacardiaceae*), mango, pistachio nut, cashew, sumac.

Myrtle Family (*Myrtaceae*), blue gum, guava, pomegranate, clove.

Madder Family (*Rubiaceae*), cinchona, coffee, madder.

Nettle Family (*Urticaceae*), breadfruit, fig, mulberry, hemp, hop, china grass.

Orange Family (*Aurantiaceae*), to which belong the orange, lemon, lime, grape-fruit.

Potato Family (*Solanaceae*), containing the potato, tomato, tobacco, red pepper, egg plant.

Sunflower Family (*Compositae*), represented by lettuce, chicory, endive, salsify, artichoke, carthamine.

It is worthy of notice that the great family of *Compositae*, embracing about one tenth of all flowering plants and ranking highest of all plants in specialization and development, should furnish such a meager list of economic plants, while the contribution of the grasses and palms, much inferior in number of species and far below in the scale of development, is of incalculable value to mankind, furnishing the major portion of food for the human family and sustenance to the most important domestic animals.

Number of Species.—Compared to the total number of wild plants the list of those attaining stable economic rank in cultivation is surprisingly small.

In the group of flowering plants (*spermatophytes*) there exist in nature upwards of 150,000 species. Yet from this vast array agriculture and horticulture have wrested only about 300 plants which have become of permanent usefulness. This does not include plants grown purely for ornamental purposes, for flowers, or foliage, but only those whose practical utility is of more than local or temporary importance, such as food, fodder, textile, tinctorial, and beverage plants.

Geographical Distribution.—The Old World has contributed about four fifths and the New World about one fifth of cultivated plants. Asia has been the chief contributor in the Old World, with Europe second. The regions furnishing the great majority of species of Old World origin are: China, India, with the East India Islands, southwestern Asia, the Mediterranean basin, including the Nile region. The region furnishing the most important New World plants is intertropical America, Mexico to Peru, and particularly the Andean plateaus.

Comparatively few useful plants have been developed outside of these focal areas, and none of the first order. The Arctic and Antarctic

zones have contributed none, neither has South Africa, Patagonia, or Argentina. Australia and New Zealand have produced so far only the blue gum (*Eucalyptus*) and the so-called New Zealand spinach (*Tetragonia*), both relatively unimportant.

It is remarkable also that the United States, a region of high average fertility, possessing a rich and varied flora of upwards of 12,000 flowering plants, should have added relatively such a small list to the economic plants of the world. The pumpkin and Jerusalem artichoke among vegetables and the American grape, strawberry, plum, blackberry, raspberry, and cranberry among fruits constitute its chief contribution. Of these the strawberry and grape are the most valuable. As yet none of these are extensively cultivated in other regions of the world. However, by grafting the European vine upon the root of the American grape, the great vineyards of France and south Europe have been saved from destruction by the insect pest, Phylloxera, making the New World grape perhaps our most valuable economic addition to Old World plants.

Changes under Cultivation.—Great modifications in the various plant parts, the root, stem, leaves, and flowers, are brought about by cultivation, most of which disappear in a short time if the plant is allowed to relapse into the wild state. However, there are a few cultivated plants which have never been discovered in a wild state, and which will not propagate themselves if abandoned. Among these are wheat and Indian corn. Like the dog among domestic animals these plants seem to have been so greatly modified through ages of cultivation that it is impossible for them to exist without the agency of man. The changes by which plants have been adapted more and more perfectly to the needs of man have been effected chiefly by selection. The choice, generation after generation, of the best developed individuals is a process of cumulative improvement capable of well nigh inconceivable results. Thus the saccharine content in the juice of the sugar beet has by careful selection been increased more than a hundred per cent. Robustness and stature can often be greatly augmented by cultivation in enriched soil. Many plants have been greatly improved by being hybridized with related stock. The earlier conception of cultivated plants as species specially created for the benefit of man instead of having been brought to their present state of usefulness through his age-long husbandry, led to artificial distinctions between cultivated and wild forms of the same plant. The writings of the earlier botanists, including those of the great Linnæus himself, are widely in error with reference to these relationships, and the connection of most cultivated plants with their parent wild species remained unrecognized or unknown until after the beginning of the nineteenth century. In 1807 Humboldt wrote: "The origin, the first home, of the plants most useful to man and which have accompanied him from the remotest epochs is a secret as impenetrable as the dwelling of all our domestic animals." Since Humboldt's time the researches of botanists throughout the world have revealed the wild form and region of origin of nearly all cultivated plants.

In case of plants of recent introduction, such as the strawberry, American grape, raspberry, and blackberry, the connection between the wild and cultivated forms is now a matter of common knowledge, and the relationships of those established during the last two thousand years are almost equally well known to science. It has also been found that about two thirds of the most anciently cultivated plants still grow wild in a form corresponding to some variety in cultivation. However, in the case of a small number of the most ancient group, the wild forms apparently have ceased to exist. Just as the wild progenitors of the camel appear to have perished prehistorically, just as the aurochs, ancestor of the domestic ox, disappeared from European forests during the middle ages, and as the buffalo has vanished from American plains during the last half century, likewise the parent wild species of tobacco, wheat, maize, broad bean, lentil, ervilla, chick pea, and probably the sweet potato and carthamine, have become extinct.

Consequently the very existence of these depends upon their cultivation. However, a plant once in cultivation is rarely, if ever, completely abandoned, even in case of species of minor importance. When replaced by more useful plants, or when largely discontinued for any economic reason, limited cultivation persists, as in case of dyer's woad when supplanted by indigo. The mallow grown as a vegetable by the Romans, and fennel and cummin once widely used in medicine, are doubtless still locally planted. Indigo and madder have been largely replaced commercially by chemical products from coal tar, yet both will be long continued in cultivation in some regions of the world. An interesting example of introduction, long use, and final abandonment is furnished by the history of alexanders, a plant closely related to spinach and celery, and, at one time, the most widely grown umbelliferous vegetable in Europe. Theophrastus (about 372-287 B. C.) refers to it only as a medicinal plant. About 500 years later Dioscorides (about 150) describes it as edible, indicating its cultivation, and in 600 years more we find Charlemagne (742-814) ordering it to be planted on his farms. Great use of it was made particularly in Italy for a long period, but in 1800 its cultivation was hardly remembered in England and France, and it is not mentioned in their gardeners' books since. Thus we see how a plant, economically important for 1,500 years and still abundant in a wild state, was entirely supplanted in cultivation by other plants better fitted to the needs of man.

Extensive cultivation in any region does not necessarily indicate ancient use there; neither does recent introduction denote a plant new to husbandry. The Chinese, who have grown tea for ages, formerly supplied the outside world, yet India, where cultivation began about 1870, now exports more tea than China. The increasingly popular grape fruit, or pomelo, an ancient Asian citrus fruit, has become established in Florida and California during the last 25 years.

HISTORY OF PLANT CLASSIFICATION

The science which treats on plants dates back to Solomon, who, "spake of trees, from the cedar of Lebanon to the hyssop on the wall." The ancient Chaldaeans, Egyptians and Greeks, were cultivators of the science. Theophrastus wrote a History of Plants, three hundred years before Christ, and described about five hundred species. Pliny, the Elder, described about five hundred species used in the treatment of diseases.

It was not however until the sixteenth century that a genuine interest was taken in the science of botany, when Otto Brunfels, a physician of Bern, Switzerland, gave his attention to the science. He may in fact be looked upon as the restorer of the science of botany. In his Herbal, which was printed at Strassburg, he described a large number of plants, chiefly of central Europe, and illustrated them by beautiful wood-cuts.

William Turner, termed "The Father of English Botany," wrote the first part of his New Herbal in 1551. In these early works the descriptions were mainly for medicinal purposes. Plants which appeared similar were placed together, but little attempt was made at systematic classification. Crude attempts at systematizing plants were gradually evolved, based upon external appearance alone, as is illustrated in the Herbal issued in 1597 by John Gerard (1545–1612), a barber surgeon and keen student of British plants.

Probably the earliest attempt at a methodical arrangement of plants was made by Andreas Caesalpinus of Florence, Italy (1519–1603). In his work De Plantis, he divided the 1520 plants then known into fifteen classes, the distinguishing character being taken from the fruit. John Ray (1627–1705) did much to advance the science of botany. He separated flowering from flowerless plants, dividing them into Dicotyledons and Monocotyledons. His classification of plants was founded on the correct idea of affinities of plants.

The University of Oxford established its first professor of botany under Dr. Robert Morrison, who published a systematic arrangement of plants, following largely on the lines suggested by Caesalpinus. He divided plants into eighteen classes, the distinguishing feature being determined as to whether the plants were woody or herbaceous, also taking into consideration, the nature of the flowers and fruit.

J. P. de Tournefort, who was long at the head of the French School of Botany, published a systematic arrangement in 1694–1700. He described about 8000 species of plants and arranged them into twenty-two classes. His classification was largely determined by the corolla, also distinguishing herbs and under-shrubs from trees and shrubs. His system was used for a long period in Europe, but finally displaced by Carl von Linne, or Linnaeus.

The Linnean system was founded on characteristics of the stamens and pistils, which are the sexual organs of the flower, and hence it is often termed the sexual system. This system takes into account only a few characters of the plant, and in no manner arranges them by their natural affinities. It is not a scientific or natural arrangement and Linneaus himself claimed it was only a stepping stone to plant classification.

Plant fertilization was a subject which early attracted attention. The idea of separate sexes in plants was entertained in very early times, even before separate male and female organs had been demonstrated. The production of dates in Egypt, by bringing two kinds of flowers into contact proves that some ideas were prevalant on that subject. The female date-palms only were cultivated, and wild ones were brought from the desert to fertilize them. Herodotus tells us that the Babylonians knew of old that there were male and female date-trees. This fact was also known to the Phoenicians and other nations of Asia and Africa.

A great step forward in plant classification came as the result of the work of Antoine Laurent de Jussieu (1748–1836). His Uncle, Bernard de Jussieu, was a follower of the Linnean system. Early in life Antoine became botanical demonstrator in the Jardin des Plantes and thus gave his time to the science of Botany. The necessity of proper plant arrangement led him to consider the best possible methods, and, following the lines already suggested by his uncle, adapted a system founded in part on that of Ray, in which instance he embraced all the discoveries in organography, also adopted the simplicity of the Linnean definitions, and displayed the natural affinities of plants. His Genera Plantarum, begun in 1778, and published in 1780, was an important advance and formed the basis of all natural classifications. In arranging plants according to a natural method, it is necessary to have a thorough knowledge of structural and morphological botany, therefore we find that the advances made in these departments have materially aided the efforts of systematic botanists.

One of the most ardent followers of this natural method was Augustin Pyramus de Condolle (1778–1841) who in 1813, published a work in which he showed that the affinities of plants are to be sought by the comparative study of the form and development of organs (morphology), and not by plant functions, or the physiology of the plant. His Prodromus Systematis Naturalis Regni Vegetabilis covered an arrangement and description of all known plants. De Canddolle's own herbarium was extremely rich. He had visited and carefully examined many of the most extensive collections, especially those of Paris. Many collections, as well as separate families, were frequently submitted to him by individuals for his examination. His library, too was stored with almost every important publication required for his work. With such ample materials, and aided by untiring interest in his work, he pursued his study until his death.

The work was continued after his death by his son, Alphonse de Candolle, with the aid of other eminent botanists. The following table gives historical and economic data concerning some of the most important cultivated plants based largely upon the researches of the great Swiss Botanist Alphonse de Candolle:—

Common Name.	Scientific Name.	Plant Family.	Character.	Origin.
Agave (Amer. Aloe, Century Plant)	*Agave americana*	Amaryllis Family *Amaryllidaceae*	Perennial	Mexico
Alfalfa (Lucerne)	*Medicago sativa*	Pea Family *Leguminosae*	Perennial	Central Western Asia
Almond	*Amygdalus communis*	Rose Family *Rosaceae*	Small tree	Mediterranean basin, Western Asia
Apple	*Pyrus Malus*	Rose Family *Rosaceae*	Small tree	Europe, Asia Minor
Apricot	*Prunus armeniaca*	Rose Family *Rosaceae*	Small tree	China
Areca Nut Palm (Betelnut)	*Areca Catechu*	Palm Family *Palmaceae*	Small tree	Malay Archipelago
Arnotto or Anatto	*Bixa Orellana*	Bixa Family *Bixaceae*	Small tree	Tropical America
Arrowroot	*Maranta arundinacea*	Arrowroot Family *Marantaceae*	Perennial	Tropical America
Artichoke (European)	*Cynara Cardunculus*	Sunflower Family *Compositae*	Perennial	Southern Europe, Northern Africa
Artichoke (Jerusalem)	*Helianthus tuberosus*	Sunflower Family *Compositae*	Perennial	Ohio and Mississippi valleys
Asparagus	*Asparagus officinalis*	Lily Family *Liliaceae*	Perennial	Europe, Western Asia
Avocado or Alligator Pear	*Persea gratissima*	Laurel Family *Lauraceae*	Tree	Mexico
Banana	*Musa sapientum*	Banana Family *Musaceae*	Perennial	India

Years of Known Cultivation.	Historical Notes.	Economic Importance.
1000	Cultivation in Mexico far antedates Spanish discovery. Introduced into Europe 1561 from South America.	Extensively cultivated in the plateau of Mexico. Pulque, the national beverage of the Mexicans, is made from the fermented sap, and by distillation mescal is obtained. From very closely related, possibly identical, species are derived the valuable fibers maguey or Pita flax and sisal hemp, used for cordage, binding twine, etc.
2500	Introduced into Greece 470 B. C. from Persia. Mentioned in Vergil. Brought to Mexico and S. America by Spanish. Introduced into California in 1854 from Chile.	A most valuable fodder plant of great importance throughout the world. Grown extensively in Europe, Asia, Africa, North and South America. Especially adapted to dry regions, producing enormous crops under irrigation. Extensively grown in Kansas and Oklahoma without irrigation, and is chief forage crop in Colorado, Utah, California, and other western states under irrigation.
4000	Cultivation prehistoric in western Asia. Mentioned by Theophrastus, Pliny, and Dioscorides.	Sweet almonds commercially important in S. Europe, W. Asia, N. Africa, and California, but the United States import about $1,000,000 worth of nuts annually in addition to present production. Bitter almonds limited in cultivation; used in making flavoring extracts and prussic acid.
4000	Cultivation prehistoric. Abundantly used by Lake Dwellers of the Stone Age in Italy and Switzerland.	Most important fruit of the temperate zone, area of production, consumption, and variety of product being considered, ranking with the grape, olive, orange, lemon, and banana, among the six leading fruits of the world. North America is preëminently the leading apple growing region. Cultivation dates back to the earliest settlements, the records showing production of 500 barrels of cider by one man in New York in 1639. In the United States, New York, Pennsylvania, and Ohio produce about one third of the total crop.
4000	Cultivation in China antedates 2000 B. C. Introduced into S. E. Europe at the time of Alexander the Great, about 325 B. C.	Extensively grown in N. India, Persia, S. Europe, and Egypt. Although marketable quantities are grown in New York, crop commercially important in the United States only in California and Oregon, whence large quantities of the fresh and dried fruit are shipped to the eastern states and abroad.
2000	Anciently cultivated by Malaysian peoples. Introduced into China 111 B. C.	Great quantities of the nut are grown in India, Cochin China, Ceylon, and the Malaysian Islands; a considerable article of trade in the East, where betel chewing is practised. The areca nut mixed with lime and chewed with betel leaves acts as a stimulant and blackens the teeth. The nut also yields a kind of catechu.
1000	Cultivation prehistoric in tropical America. Now naturalized in India.	Also called anotto, arnatto, and annotta. Source of most widely used dye for coloring dairy products, being the standard butter and cheese color in the United States, England, and Holland. Has limited use as a dye in calico printing. Anciently used by natives of Brazil, Central America, and West Indies to stain their bodies red, and by Mexicans in painting.
300	Cultivation widely diffused in tropical America and West Indies since Spanish discovery. Also introduced on the coast of Guinea in Africa.	Widely cultivated in the East and West Indies and in Africa for food. Large imports of prepared arrowroot made to Europe and the United States. A starch food highly esteemed for invalids and children.
2000	Cultivated by the Romans. Introduced into England 1548. Naturalized as a weed in the pampas of Buenos Aires, spreading over vast areas in the nineteenth century.	Much grown and highly valued table vegetable in Europe. Sparingly used in the United States. In wild state called cardoon.
300	Tubers used by the Indians. Introduced into England 1616. Now cultivated in Europe.	As yet grown only to a limited extent in the United States, chiefly as food for pigs. Very little used as table vegetable. Yields enormous crops, 200 to 500 bushels per acre. Alcohol is made from the tubers in Europe.
2000	Much changed by cultivation, the succulent young stems used for food attaining many times their normal size in the wild state.	Increasingly popular table vegetable. Cultivation becoming important market garden industry near the large cities of Europe and the United States.
400	Common names absurd. Not a pear. Avocado is a corruption of the Mexican name.	Fruit highly prized and much grown in tropical countries; is both wild and cultivated in Mexico, West Indies, and Brazil. Cultivation now established in S. Florida and S. California.
4000	Cultivation antedates historical records in India. Pliny mentions that the Greeks under Alexander the Great saw it in India.	The most important tropical fruit widely used in temperate regions, extensively cultivated in tropical countries throughout the world. Produced in enormous quantities in the West Indies and Brazil, and shipped in constantly increasing volume to the United States and Europe. Beginning with a few hundred bunches in 1870, consumption in the United States has increased to upwards of $5,000,000 worth annually. Banana flour is becoming a staple article of food.

Common Name.	Scientific Name.	Plant Family.	Character.	Origin.
Barley	*Hordeum vulgare*	Grass Family *Gramineae*	Annual	Asia
Bean, Broad	*Vicia Faba*	Pea Family *Leguminosae*	Annual	Southwest Asia
Bean, Lima	*Phaseolus lunatus*	Pea Family *Leguminosae*	Annual	Brazil
Bean, Navy or **Kidney**	*Phaseolus vulgaris*	Pea Family *Leguminosae*	Annual	South America
Bean, Soy	*Dolichos soja*	Pea Family *Leguminosae*	Annual	China, Japan, Java
Beet	*Beta vulgaris*	Goosefoot Family *Chenopodiaceae*	Biennial or Perennial	Mediterranean region
Betel Pepper	*Piper Betle*	Pepper Family *Piperaceae*	Shrub	Malay Archipelago
Blue Gum	*Eucalyptus globulus*	Myrtle Family *Myrtaceae*	Tree	Australia
Breadfruit	*Artocarpus incisa*	Nettle Family *Urticaceae*	Tree	Sunda Islands
Broom Corn	*Sorghum saccharatum var.*	Grass Family *Gramineae*	Annual	Tropical Africa
Buckwheat	*Polygonum Fagopyrum*	Buckwheat Family *Polygonaceae*	Annual	Manchuria, Siberia
Cabbage	*Brassica oleracea*	Mustard Family *Cruciferae*	Annual, Biennial, Perennial	Europe
Cacao	*Theobroma Cacao*	Byttneria Family *Byttneriaceae*	Small tree	Amazon and Orinoco valleys
Carrot	*Daucus Carota*	Parsley Family *Umbelliferae*	Biennial	Europe

Years of Known Cultivation.	Historical Notes.	Economic Importance.
4000	Cultivation extremely ancient. Found in oldest Egyptian monuments and in remains of Lake Dwellers of Stone Age in Switzerland. Mentioned by Theophrastus.	Important grain, ranking sixth among cereals, being preceded by wheat, rice, maize, oats, and rye. Greater part of crop in Europe and the United States used in the manufacture of beer. The finest malting barley is grown in Bohemia. Produces crop in great extremes of climate, being grown in Norway, Alaska, and Iceland, also in Algeria, Egypt, and India, as well as in temperate regions. California leads production in the United States.
4000	Cultivation dates back to the Bronze Age by Lake Dwellers of Switzerland and Italy. Known to the Hebrews 1000 B. C.	Important article of food in Europe and W. Asia; also valuable forage plant; grown in gardens and as a field crop. All species of the bean have a very high food value; are relatively cheap in price, but much less easily digested than cereals.
400	Found in old Peruvian tombs. Introduced into Africa during period of the slave trade.	Widely cultivated in tropical Africa, sparingly in temperate regions. Production in the United States most extensive in California.
400	Introduced into Europe subsequent to discovery of America.	Extensively grown in the United States, over 150 varieties in cultivation, as a garden vegetable, "string beans," as a fodder crop, and for food. The closely related "frijole" is universally grown in Mexico and Spanish American countries, where it ranks next to maize as a staple food.
4700	Very ancient in China; records show cultivation dating to 2700 B. C.	The common bean of China and Japan, grown in immense quantities. Various preparations form a part of the daily food, to a considerable extent taking the place of meat in supplying the proteid elements. Now grown in Europe and southern and southwestern United States as forage and soiling crop.
2200	Anciently cultivated for leaves and roots used as vegetable. Sugar beet culture modern, being established in Germany and France about 1810.	The chief source of sugar, furnishing about three fifths of the total product; sugar cane, which for 2,000 years had contributed practically all of the world's supply, being reduced to second place during the last half century by the enormous sugar beet crops of Europe—Germany, France, and Russia leading in production. The sugar beet industry is increasing very rapidly in the United States, notably in Michigan, Nebraska, Colorado, California, and Utah. The development of a profitable amount of sugar in the beet is one of the most remarkable agricultural achievements of the nineteenth century, elevating an ancient but minor garden vegetable to front rank among the economic plants of the world.
2300	Leaves chewed with areca nut since 400 B. C. by Malays of the East Indies.	Cultivation extensive in the East Indies, where the consumption of leaves by chewing with the areca nut is enormous. Narcotic stimulant.
75	Introduced into Europe, Asia, Africa, and America about 1850. First planted in California in 1856.	Said to be the most rapidly growing tree in the world; wood hard, difficult to work, used for wheel spokes, mining timber, carpentry, not attacked by borers. Leaves yield eucalyptus oil, important medicinally.
400	In cultivation in tropical East Indies when first visited by Europeans.	Fruit one of the chief food products of the Indian Archipelago and the Pacific Islands. Bark furnishes fiber for clothing. The milky juice and wood are also of value.
4000	The species of *Sorghum*, of which this is one of many varieties, has been in cultivation since very ancient times. Grown in the United States before 1800.	This variety of the *Sorghum* is grown for broom making only in Italy, France, Germany, and the United States. Illinois, Kansas, Missouri, and Oklahoma, ranking in the order named, produce seven eighths of the crop, Illinois growing about one half of the total crop of the United States. (See *Sorghum cane.*)
2000	Introduced into Europe from northwestern Asia during the Middle Ages.	A food plant of minor importance compared to the standard cereals, but extensively grown in European and Asiatic Russia, where buckwheat porridge is a common article of diet, and to a smaller extent in other European countries and in the United States. In the United States buckwheat flour is used chiefly for pancakes or griddlecakes, infrequently for bread. Production declining, the crop of 1900 being one third less than that of 1860. Japanese varieties of value as honey plants.
4000	Ancient Greeks cultivated three varieties. Pliny mentions six. In modern cultivation varieties very numerous.	Widely cultivated in the Old World, particularly in Europe, and grown on a greater number of farms in the United States than any other vegetable. Over 150 varieties are enumerated. Ages of cultivation have developed the widely modified forms, kale, kohlrabi, cauliflower, Brussels sprouts, also the tree- or cow-cabbage grown for cattle in France, often attaining a height of 10 feet and sometimes 12 or 15 feet.
1000	Anciently cultivated in tropical America.	Source of cocoa, chocolate, and the soft solid oil called cocoa butter, which constitutes over 50 per cent of the seeds. The fruit is eaten and also used in making a fermented liquor.
2000	Introduced into England from Holland about 1500. In wild state becomes troublesome weed.	In general but limited cultivation as stock food and garden vegetable in Europe and the United States.

Common Name.	Scientific Name.	Plant Family.	Character.	Origin.
Carthamine	*Carthamus tinctorius*	Sunflower Family *Compositae*	Annual	W. Asia, Arabia
Cashew	*Anacardium occidentale*	Sumac Family *Anacardiaceae*	Tree	Tropical America
Cassava	*Manihot utilissima*	Spurge Family *Euphorbiaceae*	Small shrub	Tropical America, Brazil
Castor Oil Plant	*Ricinus communis*	Spurge Family *Euphorbiaceae*	Annual, Small shrub	Tropical Africa, Abyssinia
Celery	*Apium graveolens*	Parsley Family *Umbelliferae*	Biennial	Europe, No. Africa, Western Asia
Century Plant (see Agave)				
Cherry	*Prunus Cerasus*	Rose Family *Rosaceae*	Small tree	W. Asia, E. Europe
Chickling Vetch	*Lathyrus sativus*	Pea Family *Leguminosae*	Annual	West Asia south of the Caucasus
Chick Pea	*Cicer arietinum*	Pea Family *Leguminosae*	Annual	Persia
Chicory	*Cichorium Intybus*	Sunflower Family *Compositae*	Perennial	Europe, Northern Africa, W. Asia
China Grass or Ramie	*Boehmeria nivea*	Nettle Family *Urticaceae*	Perennial, Shrub	China, Japan
Cinchona	*Cinchona Calisaya*	Madder Family *Rubiaceae*	Small tree	Peru, Bolivia
Cinnamon	*Cinnamomum zeylanicum*	Laurel Family *Lauraceae*	Small tree	Ceylon, India
Clove	*Caryophyllus aromaticus*	Myrtle Family *Myrtaceae*	Small tree	Molucca Islands
Clover (Alsike)	*Trifolium hybridum*	Pea Family *Leguminosae*	Perennial	Temperate Europe
Clover (Egyptian)	*Trifolium alexandrinum*	Pea Family *Leguminosae*	Annual	L. Syria, Asia Minor
Clover (Italian)	*Trifolium incarnatum*	Pea Family *Leguminosae*	Annual	Southern Europe
Clover (Red)	*Trifolium pratense*	Pea Family *Leguminosae*	Perennial	Europe, Algeria, Western Asia

Years of Known Cultivation.	Historical Notes.	Economic Importance.
4000	Grave clothes of mummies are dyed with carthamine and fragments of the plant are found in ancient Egyptian tombs. Introduced into China about 150 B. C.	Used since remote antiquity as a red dye for cotton and silk; now largely supplanted by coal tar colors except in India and China, where it is still an article of local commerce. Cultivated in France, Spain, Italy, India, and China. The extract mixed with talcum forms the cosmetic known as rouge.
400	Widely diffused in tropical countries since Spanish discovery, particularly in India and Guinea. Introduced into East Indies by Portuguese.	Much cultivated in the tropics for fruit and nuts used for food. Fruit also furnishes a vinous liquor, and the tree yields a gum similar to gum arabic.
1000	Long cultivated in Brazil, and after Spanish discovery extended to Africa and Asia.	Chief source of tapioca. Important food plant in tropical countries. Cultivation now established in Florida.
4000	Prehistorically cultivated. Seeds found in ancient Egyptian tombs. Mentioned by Theophrastus and Dioscorides.	Cultivated in Italy, France, Spain, Algeria, India, West Indies, South America, and the United States for oil expressed from seeds. Cultivation in the United States limited mainly to Oklahoma, Kansas, Illinois, and Missouri and of little importance. Oil largely used in medicine and the arts, and in India as lamp oil.
3000	Anciently grown in Mediterranean region. Mentioned in Homer's *Odyssey*.	Widely cultivated in Europe and rapidly increasing in the United States, in 1900 rising to tenth rank in acreage devoted to garden vegetables.
2000	Grown before Christian era in W. Asia and S. Europe. Mentioned in Vergil's *Georgics*.	Cultivated in temperate regions of Europe, Asia, and the United States. Is included among the 15 leading fruits of the world. Ranks about eighth among fruits of the United States. Pennsylvania and California lead in production.
2000	Cultivation in S. Europe dates back to Greeks and Latins. Now cultivated in N. India and W. Asia.	Minor food plant cultivated in India, Germany, France, and some other countries for its seeds.
4000	Cultivation ancient in India. Referred to in Homer's *Iliad* and by Theophrastus.	Grown extensively in Asia for the table and for stock food. Seeds sometimes substituted for coffee.
2000	Cultivated by the Greeks and Romans.	Chief use as an adulterant for coffee, the practice originating in France. Chiefly grown in France, Holland, Germany, and Scandinavia, but recently becoming of commercial consequence in limited areas in the United States, Michigan producing about nine tenths of the crop.
	Not a grass, but a nettle, closely related to the hemp and the hop. Cultivation begun in S. France about 1850 and sparingly in S. United States about the same time.	Valuable fiber plant, mostly grown in China and India. Excellent fiber, stronger than hemp, and nearly as pliable as silk. Used in making China grass cloth and bank note paper.
250	Bark introduced into Europe in 1639 by the Countess of Cinchon, whence the name. Now extensively cultivated in India, Japan, Ceylon, and Jamaica.	Source of quinine, the most important drug in tropical medicine, and widely used throughout the world. Cultivation becoming more and more extensive.
150	Cultivation begun in Ceylon about 1765. Bark of wild trees used from remote antiquity.	Cultivated for bark in Brazil, West Indies, Egypt, and Java, but cultivation now declining in favor of coffee.
300	Brought to Europe by Portuguese after the establishment of East Indian trade.	Valued spice tree; the dried flower buds are the cloves of commerce. Cultivated on many tropical islands and coasts, chiefly in the Moluccas, Sumatra, Java, Mauritius, Zanzibar, Jamaica, and French Guiana. The oil of cloves widely used in flavoring and perfumery and also in medicine.
500	Introduced into Great Britain from Sweden in 1834.	Named for Alsike, Sweden, where it has been long cultivated. One of the best clovers, but as yet only sparingly cultivated in the United States. Excellent honey plant.
500	Cultivation universal though not ancient in Egypt. Now being introduced in S. United States.	Especially adapted to warm climates; principal food of cattle in Egypt. In the United States sparingly cultivated in the Southern States.
500	Cultivation long only local in S. France. Introduced into Italy and England during the last 100 years. Now extending to the United States.	Valuable fodder plant in S. France and Italy. In the United States cultivation is increasing though not extensive.
500	Introduced into England from the Netherlands in 1663.	A most valuable forage and soiling plant, the leading leguminous fodder of the North Central and Eastern United States, where it is relatively as important as alfalfa in the West or the cow pea in the South. In common with other clovers and most leguminous fodders it is of great value in crop rotation, enriching the soil through the agency of bacteria living in the roots, which transfer nitrogen from the air to the soil, a remarkable natural process of fertilization.

Common Name.	Scientific Name.	Plant Family.	Character.	Origin.
Coca	*Erythroxylon Coca*	Erythroxylon Family *Erythroxylaceae*	Small shrub	Peru and Bolivia
Cocoa (see Cacao)				
Cocoanut Palm	*Cocos nucifera*	Palm Family *Palmaceae*	Tree	Malay Archipelago
Coffee	*Coffea Arabica*	Madder Family *Rubiaceae*	Small tree	Abyssinia, Arabia
Coracan	*Eleusine coracana*	Grass Family *Gramineae*	Annual	India
Corn, Indian, Pop-corn, Sweet Corn (see Maize)				
Corn Spurry	*Spergula arvensis*	Pink Family *Caryophyllaceae*	Annual	Europe
Cotton (Common)	*Gossypium herbaceum*	Mallow Family *Malvaceae*	Annual, Small shrub	India
Cotton (Sea Island)	*Gossypium barbadense*	Mallow Family *Malvaceae*	Annual, Small shrub	West Indies, Tropical America
Cow Pea	*Vigna Catjang*	Pea Family *Leguminosae*	Annual	Southeastern Asia, Malay Archipelago
Cranberry	*Vaccinium macrocarpon*	Heath Family *Ericaceae*	Small shrub	Northeastern United States and Canada
Cucumber	*Cucumis sativus*	Gourd Family *Cucurbitaceae*	Annual	India
Currant (Black)	*Ribes nigrum*	Gooseberry Family *Grossulariaceae*	Small shrub	Europe, Siberia, Manchuria
Currant (Red)	*Ribes rubrum*	Gooseberry Family *Grossulariaceae*	Small shrub	N. Europe, Siberia, N. U. S. and Canada
Date Palm	*Phoenix dactylifera*	Palm Family *Palmaceae*	Tree	S. W. Asia, N. Africa
Egg Plant	*Solanum Melongena*	Potato Family *Solanaceae*	Annual	India

Years of Known Cultivation.	Historical Notes.	Economic Importance.
1000	Cultivation and use ancient in Peru and Bolivia. Supplies of leaves found buried with mummies in Peruvian tombs.	Source of cocaine. Extensively cultivated in South America, Ceylon, India, and Java. Yearly production of leaves used in South American trade estimated at 50,000,000 pounds. Coca chewing is almost universal among peoples of the Andean region.
3000	Ancient cultivation in East Indies. Now extended to tropical coasts throughout the world.	A most useful tropical tree, extensively cultivated on the coasts of India, the East and West India Islands, and Brazil. Leading food plant of the Pacific Islands. Besides the cocoanut, and its dried kernel, the copra of commerce, as chief products, palm wine, arrack, and sugar are made from the juice; fiber for cordage is obtained from the stems and coir from the husk of the nut. Cultivation has been established in Florida.
500	Beginning of cultivation uncertain, but not ancient. Introduced for cultivation in South America by the Dutch in 1718.	Coffee and tea are preëminently the leading beverage plants, cacao, maté, and the various substitutes being relatively insignificant. Commercially of great importance. Largely grown in Brazil, Mexico, Central America, West Indies, Arabia, Java, Sumatra, Ceylon, India, and Hawaii, Brazil leading with a production of over one half of the world's crop. In the United States the consumption greatly exceeds that of tea; in England tea is preëminently first.
2000	Cultivation ancient in India. More recently extended into Japan, Egypt, and Abyssinia.	Seeds similar to millet; used for food. Cultivated in India, Malay Archipelago, Japan, Egypt, and Abyssinia.
1500	Cultivation dates to the late Romans. Now widely diffused in N. Africa, W. Asia, to Hindustan and Java. Sparingly naturalized in the United States.	Cultivated for fodder in southern Europe.
